THE CAHUSAC MYSTERY.

By K. and HESKETH PRICHARD, Authors of *Roving Hearts, Don Q, Tammer's Duel*, &c.

CHAPTER I.—YOUNG MALCOLM.

IN a modern book of reference some such entry as the following might have been written under the name of the hero of this story:

'CAHUSAC, Malcolm John Cardros, son of the late Sir Malcolm Cahusac, K.C.M.G., and of Emily Fane, y. d. of David F. Cardros of Philadelphia, U.S.A. Educated Harrow, Trinity Coll., Cambridge, and University of Pennsylvania. Address—241 Park Lane. Clubs—Junior Carlton, M.C.C.'

In another volume, belonging to a series which may be regarded in the light of a national possession, it might be interesting to turn up the Sir Malcolm above mentioned, and there you would find a record of one of those distinguished British careers which, starting in family influence, and guided by individual character and ability, float serenely on until they find anchorage in the British Embassy of St Petersburg or of Berlin. Sir Malcolm in his day passed through the moulding of Harrow and Cambridge, close upon which followed his entrance into the Diplomatic Service; within three years he became third secretary, then was successively appointed attaché to the Embassy in Paris, then Washington, Paris again, after which the Foreign Office claimed him. Being now a widower, he married (for the second time) the Hon. Dorothea Lewton, only daughtor of the tenth Baron Luxillin. So far he had run the race of many predecessors. But a couple of volumes later we find his record abbreviated to its genealogical value, and closed with the unusual words, 'Found murdered in London, on the night of March 9, 1881.'

A bald statement, yet one which, in spite of its brevity, must flash a picture upon the imagination. In the dark hours of a March night, in the multitudinous city, found murdered. By whose hand? For what motive? Under what circumstances?

An inquiry among his contemporaries might bring some such answer as this: 'Malcolm Cahusac? Yes, knew him well—brilliant fellow. I was staying with the Dorrows in Worcestershire at the time. Remember how shocked we all were when the London papers came in. Bricklayer found him lying dead under the railings in Park Lane, stabbed in the back, between the shoulders. The murderer hanged? No! Fools of police never laid hands on him. Little to go upon, you know—no motive, no clue; one of the mysteries of London, as the newspapers said. I recall the whole affair perfectly. Liberal Government in at the time, too. No, no, of course, no connection; but when the reins of authority are loosened, why, anything may happen.'

If you had heard something of this kind you would, as a matter of fact, know very nearly as much about his father's death as did young Malcolm Cahusac himself on the spring morning when he sat in the Cunard express, staring out at the stations, each grayer than the last, through which they roared on the final stage of the run from Liverpool to London.

Hitherto life had been very kind to Malcolm. A boyhood spent among the Northumbrian hills, much of it passed by choice in the lone company of the woods and moors and streams; bred to a fine knowledge of all field-sports by those who for generations had served his family; happy if rather idle school-days, and the awaking to intellectual life at Cambridge, which culminated in an unexpectedly brilliant degree. Then the plunge into the entirely new environment on the other side of the Atlantic. He could barely imagine that only a year ago he had left England, half-unwillingly, to learn something of his kinsfolk across the water. And now, through the rhythmic rattle of the wheels, he seemed to hear again:

> But Yale may have her scarlet,
> Harvard her colours too;
> But for dear Pennsylvania,
> We wear the red and blue.

Ah well! it was over now. His smile ended in a perceptible sigh.

A youngish man with a shrunk figure and blanched locks among his black hair, sitting at the farther end of the Pullman, caught the expression on Malcolm's face, and sighed too with a querulous impatience. 'What has he to sigh for—a good-looking young beggar, with health and the world before him?' he complained to the companion at his side.

 [*All Rights Reserved.*]

The girl followed her husband's glance; and, because her life was merged in his curiously suffering existence, she wondered also. For the luxurious sorrows of youth were almost unknown to Lorrie Madesson; real troubles fallen early to her lot had usurped her thoughts.

Many a man might have envied Malcolm Cahusac as he sat leaning back with folded arms, his gray eyes following the flying landscape. Well-bred, well-born, with a sinewy figure too spare for dull nerves, and a high-featured face, which, if a trifle hawk-like, possessed distinction; but his mouth, with its fine sculptured lips, was almost faultless.

As if becoming aware of their glances, Malcolm turned his head towards the Madessons, and then began to make his way across the car. He had spent a good deal of time in their company on the voyage, he was always ready to help Sir Guy to or from his chair, and would listen with interest to the invalid's clever carping at life.

He had rather interested Lorrie Madesson. He was so young for his age, one could not imagine he had ever known a care; and this puzzled her, for below his careless acceptance of life she knew intuitively there lay a powerful and sensitive character, latent now, but which if awakened should work out to some fine issue. All who knew Malcolm recognised his manliness, his strength of will, his almost exaggerated sense of honour; as to his mental equipment, that had been tested by the brilliancy of his degrees, but few would have given him credit for the deeper qualities of character.

'Nearly there,' said Malcolm, dropping into a seat. 'I hope you are not very tired, Lady Madesson?'

She shook her head, then flashed an involuntary look at her husband.

Guy Madesson caught the look with a wry smile. 'Of course I am tired, but we will try not to advertise the fact,' he said, laughing a little.

The laugh had a cranky echo that always touched young Malcolm with a passing spasm of pity for the ambitious man, whose nerves, jangled by some freakage disease, had lost him a splendid career. Yes, he pitied him often enough, yet never gave a thought to the fate of the woman in the first bloom of life who was chained to that broken mate. Had there been any one to mark it, this single fact would have contributed largely to the conception of Lorrie Madesson's character at that time. For she was singularly lovely, though not according to the ethereal type of so many of her countrywomen. Her face, though oval, was strong about the jaws and chin in the imperial mould of Rome; her brown hair rippled from her brow; her eyes of a dark and vivid blue were of a shade always rare and more often seen in men than women. She was tall, and her slim yet full outlines pointed the contrast of the wizened shape at her side. Had such a girl, by so much as a glance, appealed for outside sympathy, the response must have been unfailing; but as a matter of fact it had never struck Malcolm that she needed sympathy, for she was always ready to smile and be gay without any show of that laboured cheerfulness which must surely be the chief trial of many in Madesson's case. Could Malcolm have seen through the covers of a book that lay in her travelling-bag he might have read a quotation written on a margin:

> Wanted volunteers,
> To do their best for twoscore years.

The words were an odd help to Lorrie Madesson. For Guy's razor-tongue was only sharpened to greater bitterness because of his morbid brooding over the hardness of her lot, and perhaps also a little because it was her wealth, not his own, that supplied the ameliorations and comfort which surrounded him.

The three chatted together for a few moments, and Cahusac hoped it would not be long before they met again.

Lorrie Madesson looked at him in her direct, radiant way. 'I think I shall always be glad to see you,' she said, 'even when you have become a part of the feudal system.'

Malcolm raised his brows. 'The feudal system?'

'Yes; the life England offers to people like you. It would have been better to remain in the States.'

'Why?'

'Because a ready-made niche in England is like a competency to a genius, apt to induce arrested growth.'

Madesson's crooked smile stopped her. 'My wife's republican principles forbid her to believe that a certain amount of dry-nursing is not unknown in her native country,' he remarked, and went on to ask questions about Malcolm's future.

Yes, Malcolm replied, it was to be the Foreign Office; he had passed the necessary exams. And, yes, the 'niche' was, he supposed, waiting for him, as his stepmother had cabled him to come home.

'You will follow in your father's steps?' said Madesson.

'I hope so,' answered Malcolm; but a dark look settled on his face. The question recalled the old unexplained tragedy which he had half-forgotten during the moving years now closed.

Madesson read his thought. He showed little of his malady while seated, save by an occasional jerk of hand or foot; but at this moment his foot shot out violently and touched Cahusac. Irritated by the incident, Madesson could not control an outbreak of his sneering humour.

'Do you expect to solve the mystery of his death?' he asked, raising his chin derisively. 'Bah! I'll back London to keep her secret.'

Lorrie's blue eyes flashed. She caught Malcolm's look of hurt surprise, then she bit her lip and the colour paled a little in her face. She must let it pass, another instance of her husband's privileged ill-temper.

Fortunately the train was already steaming into Euston, and the bustle and crush of arrival intervened. People in groups drifted along the platform, threaded through by a zigzag brown-velvet ribbon of porters.

A footman in dark livery came up to Malcolm.

'Hallo, Andrew!'

'I hope you're well, Master Malcolm—beg pardon, sir.'

'All right, thanks. Luggage in the rear van.'

Malcolm Cahusac moved off to bid good-bye to one or two people, helped a trio of ladies to winnow their belongings from a mass of baggage, and then stood beside the brougham till his own should be collected. While he waited he saw Lady Madesson emerge from the train, followed by her husband, who was dexterously landed on the platform by his man. Then, with a stick in one hand and an umbrella in the other, Madesson started to cross the space to the low-hung carriage drawn up opposite. His shuffling, uncertain, jointless action brought a grin to many a face round him. Sir Guy kept his eyes down, for it needed every shred of energy left to him to reach the haven of the open door in front; but he was acutely aware of the ghastly comedy of the spectacle he presented. A great compassion strengthened Lorrie for the ordeal of the drive which she knew lay ahead.

'Curse it all! Look at that rag-doll!' jeered one of two men who stood near Malcolm. 'How did he ever persuade her to marry him?'

His companion stopped to consider the scene, then showed the cockney's knowledge of life. 'He'll make her a duchess if he lives long enough. That's Mawdson.'

'Dry up!' growled the first.

Lady Madesson, leaving her husband in his carriage, walked over to Malcolm Cahusac and held out her hand. 'Good-bye,' she said. 'We both thank you for giving us your help so often on board.'

Malcolm, still remembering Sir Guy's last speech, coldly professed himself glad to think he had been able to be of use.

The blue of her eyes seemed to darken; she understood and was sorry for him, but it was hard to put what she wished to say into words. She hesitated, then, 'Can you not forgive—us?' she said, and turned away without leaving him time to answer.

Malcolm drove off, and while he watched the life of the streets he was thinking of Lorrie. He had never thought much about her before; but now he realised that although she was younger than himself, she had appraised him silently as a woman appraises possibilities in a boy. He felt suddenly dashed by the conviction of her intangible clarity of vision. He had believed himself a man, yet now he blushed for his own incompleteness, his immaturity, for like all young males he desired a little worship, or at the least a little blindness in those about him.

Then his mind was turned into another channel; for, as the brougham stood held up amongst a mass of vehicles at the Marble Arch to allow of the passage of a stream of riders and carriages from the Park, he caught sight of a young girl on horseback followed by a groom. She was very fair, with a child's purity of glance and complexion; her long hair hung in flaxen waves to her waist; and Malcolm pushed his head far out of the window to follow her slender figure as she trotted away.

'By Jove! she's prettier than ever, dear little Alice!' he exclaimed half-aloud, and wandered off into recollections that brought a smile and a very gentle look to his face.

It was April, and all the fullness of the spring was come. A flood of sunshine poured itself abroad, striking strong notes of colour from the young green of the trees and the long flower-beds with their dominant yellows and blues of blossom. The call of the spring warmed his blood; the beauty and the mystery of life stirred in his veins; his eyes filled with a dim vision of the future, vague and undefined; but it held a promise, surely it held something far above the common lot, glorious, satisfying.

The carriage turned out of the sunshine, stopped, and in another moment Malcolm was holding Lady Cahusac's hand. As he stooped his stepmother kissed him on the forehead with the frigid kiss he had half-forgotten.

'I am glad you have come home, Malcolm,' she said.

It is curious how, at times, a remark or a question gains a haunting quality and recurs insistently. These mental echoes are rarely pleasant. Such was Malcolm's experience as he sat in an arm-chair before the fire in his bedroom somewhere about seven o'clock the same evening. By rights his mind should have been occupied with his home-coming, with the uplifting of such hopes as he had felt when he drove down Park Lane. Yet it was not so. With Lady Cahusac's greeting, the happy mood had fallen from him. She looked extremely ill, and he was glad he had not delayed in obeying her recall. He thought a little of this, and reverted with a half-smile to a legend in his family concerning a certain ancestor, one Leaf, who had harried the coasts of Northumberland before the centuries of Christ passed into two figures. This Leaf, tradition said, had loved the daughter of a contemporary Jarl of Northumbria, and, being surprised with her in a serf's hut in the forest, was there slain after a fight which gave material to the harps of minstrels for decades. The story went that as he stood up for his death-battle he sang and prophesied, foretelling things which

after came to pass; and tradition held that the blood of the Viking translated itself in the veins of his descendants into a susceptibility which was less than foreknowledge and yet more than mere suggestion. Malcolm had long thrown off his childish belief in the superstition, yet it cannot be denied that it recurred to him when, on this night of his home-coming, he fell a prey to an acute depression. But it was not the legend of Leaf which compelled his attention, which troubled him like a persistent tapping at the back of his mind. He was haunted by the last words Madesson had spoken: 'Do you expect to solve the mystery of his death? Bah! I'll back London to keep her secret.' He strove without success to turn to some pleasanter train of thought; but these words knocked persistently like unwelcome visitors at the door until Malcolm, outwearied by their importunity, admitted them.

Did he expect to solve the mystery? Had he in truth set any such purpose before himself as a part of the design of his manhood? To this he could answer both yes and no. Years ago, boy-like, he was filled with the ambition of revenging his father when he should be old enough. Afterwards, the hurrying interests of his life had thrust both the tragedy and the desire behind them. But to-day the remembrance sprang forth again and challenged him.

After all, what did he even now know of the circumstances of Sir Malcolm's death? Little enough. The question followed, how was it that he knew so little? His mind began to cast backwards. Had his stepmother ever spoken of it? With a shock, Malcolm realised that she never had—not one word. Why? Perhaps her silence was hardly surprising; it was natural that she should avoid so painful a subject. He would dismiss it himself for to-night at any rate.

He took up the poker and stirred the fire, for the weather had changed since morning, and a gale howled at the windows. But, try as he might, he could not force his thoughts in any other direction but that of the one compelling question.

During the many years from his early childhood until now, had his stepmother ever talked with him of his father? Never! And yet he had from time to time asked her about him. He could recall a score of occasions when he had put questions, and how meagrely and haltingly she had answered them. From whom, then, had he gained his knowledge of, his pride in, his love for, his father's memory? From Wat Miller, the old keeper in Northumberland, who had told him of the straight barrels Sir Malcolm held; from Simon Blackhouse, the boatman; from Ian MacNish, the stalker; from Mrs Yorke, the old housekeeper, who had been his father's nurse. Malcolm found, with a shock, that his knowledge of his father was built entirely on these foundations, and that during sixteen years Lady Cahusac had hardly mentioned her dead husband. And again the inquisitor within his own brain asked, why—why?

Yet he knew by some instinct that, notwithstanding her silence, Lady Cahusac had adored her husband, that the whole emotion of her nature had been expended in that love. This might account for her reserve in his childish days; but with his manhood the story and the circumstances of his father's death had become as much his heritage as his name or the old north-country estate. Madesson's exact words recurred to him with a new meaning: 'solve the mystery!' Was there any mystery beyond the fact that the murderer had never been discovered? Suddenly he knew that this was the suspicion that he had been fighting off all the evening. Lady Cahusac's reticence suggested the idea, and he shrank from it. He sat a while frowning into the dying fire; when he rose and began to dress he had come to a decision. He could not postpone the subject; this very night Lady Cahusac must tell him what there was to tell. Before he slept he must be able to shake off the indefinable dread that overshadowed him. Of course everything could be explained! Why not?

(To be continued.)

THE TRANSFORMATION OF CENTRAL SOUTH AMERICA.

By JOHN D. LECKIE.

DURING the last few years special attention has been drawn to South America and the great progress made in that part of the world, especially in the three countries of Brazil, Argentina, and Chili, and there is reason to believe that the next few decades will see a great transformation of the central portion of the continent.

The construction of new railways, from several directions, which will soon penetrate into the very heart of South America, is bound to give a great impetus to settlement and trade. Regions formerly very inaccessible will be placed within sixteen to twenty days' steam communication from London. Every day sees greater facilities and greater comfort offered to the traveller, while distances are shortened. Even in the early days, when railways, steamers, and telegraphs were unknown, there were regions in the heart of South America that had attained a high degree of prosperity; though in those days a voyage to regions such as Paraguay and Matto Grosso was an undertaking which occupied much time, and was attended by great hardship, risk,

and discomfort—almost, if not quite, as much as does a journey to-day to the unexplored regions of Central Africa. The decay of such districts as Matto Grosso and Goyaz (in the interior of Brazil) is due in great measure to the exhaustion of the gold and diamond mines to which they once owed their prosperity.

There was a time when Paraguay was a richer and more prosperous country than the neighbouring Argentina. On the outbreak of the disastrous war which Paraguay waged against the combined forces of Argentina, Brazil, and Uruguay, the population of Paraguay was nearly equal to that of Argentina—one million three hundred thousand. The former country possessed a line of railway when such a means of locomotion was unknown in the Argentine, with the exception of a short suburban line in Buenos Ayres. She had a large and well-appointed arsenal, and dockyards in which ships of war were built. These and other public works had been constructed with native capital, without having recourse to foreign loans. The close of the war left her completely prostrate, with her resources annihilated and the country almost depopulated.

The area of the three districts named—Paraguay, Matto Grosso, and Goyaz—is approximately a million square miles; their combined population is certainly less than a million, though no exact or reliable figures are available. The area that will be tapped by the new railways, however, is much greater than this, for it includes large tracts in Bolivia and northern Argentina. The Brazilian state of Matto Grosso is an empire in itself. With an area of more than half a million square miles—nearly four and a half times that of the British Isles—it has a population of less than one hundred thousand. Yet it is rich in natural resources, and has on the whole a fine and healthy climate and a rich soil; in fact, it contains all the elements necessary for progress. Its backwardness so far has simply been due to its comparative inaccessibility. A railway is now being made from Santos which will place Corumbá (Matto Grosso) within eighteen or twenty days from London, instead of at least forty days by the present circuitous route *vid* Buenos Ayres. There is every reason to believe that the opening of the railway will be followed by a rush of settlers to these new fields, and a consequent development of industry and trade. Nor is this the only good result that the railway will bring in its train. Owing to its remoteness from the federal capital (Rio Janeiro), Matto Grosso has always been one of the most lawless and disturbed provinces of Brazil. Once the line is completed, troops can be speedily despatched and disturbances readily quelled; the railway, therefore, will be to a certain extent a guarantee of peace.

Another important railway now in process of construction is that which will place Asuncion, the capital of Paraguay, in communication with the Brazilian port of São Francisco. At present São Francisco is a small town of little importance, but it possesses a fine harbour, and is already a port of call for the large German transatlantic steamers. When the back-country is developed by railways there is no doubt that it will become an important seaport. The neighbouring port of Santos owes its rapid rise to the same cause; and, in proportion to its population, it is doubtful if any port in the world does such a large trade as Santos, for it must be noted that its trade is entirely local, and not a mere transit trade which supports emporiums such as Hong-kong and Singapore. The exports of Santos are wholly of local produce, almost entirely coffee.

The line from São Francisco to Asuncion will pass through some of the finest scenery in South America. It will run close to the Iguassú Falls, the South American Niagara, one of the three great waterfalls of the world. Even now, though very inaccessible, these falls attract large numbers of travellers annually. The country traversed by the line is as yet scarcely settled, though it possesses a fine climate and fertile soil. At Villa Rica the railway will connect with the existing Paraguay Central Railway. This line is destined to effect a great revolution from a commercial standpoint. Much of the trade of Paraguay, which now passes through the ports of Buenos Ayres and Monte Video, and is included among their exports and imports, will pass through Brazil. The concession has been opposed by the Argentine Government, which has great influence in Paraguay and is a large shareholder in the Paraguay Central Railway; but as the new railway company has opened an office in Asuncion and is spending money on surveys and clearings, it is presumed that the project will be carried through. At present Villa Rica (Paraguay) is one of the remotest towns from Europe in the River Plate states; when the new railway is opened it will be nearer to Europe than any other town either in Paraguay or Argentina, and the mail-time between that town and London will be reduced from thirty days to about eighteen.

On the other side a line is being built which will place Asuncion in direct communication with Buenos Ayres. This railway is almost completed, and will probably be open for traffic before these lines appear in print. It is intended eventually to put large ferry-steamers on the rivers Parana and La Plata, which will carry entire trains across, so that the traveller will be able to step into a train at Buenos Ayres and travel without change of carriage to Asuncion.

It is noteworthy that whereas a few months ago Argentina was completely isolated, so far as railway connection is concerned, from the other countries of South America, railways have lately been completed, or are on the point of

completion, which will place her in direct communication with her neighbours on all sides—Chili, Bolivia, Paraguay, Uruguay, and Brazil. It is not, however, with the development of the Argentine lines, though this has been rapid and extensive, that the present article deals, but with the new lines to Central South America and the regions which will be developed by them. Of these, there is no country which is more interesting than Paraguay. That country has one of the most romantic histories of any in South America. During the sixteenth and seventeenth centuries it was ruled by the Jesuits, who brought it to a high degree of prosperity. At the present day one finds in districts now overgrown with dense jungle stupendous ruins which attest the former prosperity of the country. These buildings, which were constructed of solid masonry in an ambitious style of architecture, owed their origin to the Jesuits. Nowadays one never sees such fine buildings in the country districts of Paraguay.

When the Spanish Government, jealous of the intrigues and political power of the Jesuits, ordered their expulsion in 1768, the prosperity of the country declined notably. In 1811, taking advantage of the general rising of the Spanish colonies, Paraguay proclaimed her independence. This was effected with little bloodshed, as the Spanish Government was too much occupied in other quarters to send troops to such a remote district.

Three years later Dr Francia, one of the most remarkable men South America has ever produced, was appointed dictator. There has been much discussion regarding the character of Francia, some painting him as a hero, others as a tyrant. His scrupulous integrity was admitted even by his enemies. The following anecdote is characteristic. At one time Francia (then simply a lawyer) was informed that a certain person who had incurred his displeasure was engaged in a lawsuit, and was likely to lose it, although right was on his side. He called on the man, offered him his professional services, and by his skill as a lawyer gained the case for him. The man was profuse in his expressions of gratitude. 'You are in no way indebted to me,' curtly replied Francia. 'You have been and still are my enemy. But I will not see an injustice done, even to an enemy.' Some of Francia's ideas, such as the enforced isolation of the country and the restriction of foreign trade, may appear to us mistaken or narrow-minded, but there is no doubt that he had the welfare of his country at heart. In his later years he became morose and vindictive, apparently a result of the various conspiracies against his life. Before we pass judgment on Francia it is well to bear two facts in mind—firstly, that although he, as absolute dictator of the country for more than twenty years, could have amassed a large fortune, he lived and died in comparative poverty; and, secondly, that although the people of Paraguay execrate the memory of one of his successors, the second Lopez, to this day, they mention the name of Francia with a respect amounting to awe.

On the death of Francia, he was succeeded by Carlos Lopez, an enlightened ruler, who did much to develop the resources of the country. It was left to his successor, Francisco Lopez, to involve Paraguay in the disastrous war, already mentioned, against Brazil, Argentina, and Uruguay. On the outbreak of the war Paraguay was in a highly flourishing condition, having enjoyed a long period of peace and tranquillity, while the neighbouring countries were plunged in internecine strife; the close of the war left her completely ruined.

With the railways now being made, and the consequent development of the country, Paraguay may yet regain her past prosperity. The climate is fine, and well adapted to persons of weak constitution. The thermometer never falls below thirty degrees Fahrenheit, which temperature is experienced only in the early morning. The winter is changeable, some days being warm, others cold; the summer, though hot, is not too warm to allow manual labour to be performed by white men in the open air. The writer, who has lived fourteen years in the country, has seldom found the heat oppressive in the daytime. But on warm, calm nights in summer the atmosphere is too close for one to sleep indoors comfortably; sleeping outdoors, however, under such conditions is delightful and healthy. It is essentially an open-air climate, where one almost lives in the veranda or *patio*.

Visitors to Madeira or the Canary Islands complain that, although the climate is fine, prolonged residence there is apt to pall—the life is too vegetative and productive of ennui. Time is apt to hang heavily on one's hands, while there is little opening for business or the investment of capital. There is very little ground available for agriculture, and for what there is enormous prices are asked. These objections do not apply to Paraguay. Here there is plenty of scope for one who wishes to invest capital and at the same time enjoy a healthy outdoor life; here cattle-farming is both profitable and healthy. Many English immigrants, attracted by the fine climate, fertile soil, and cheapness of land and labour, embark in agriculture; but agriculture, notwithstanding these advantages, is not a profitable industry in Paraguay, though a hard-working family, with very small expenditure, can make for themselves a very comfortable home. Living is cheap, especially for one who resides in the country districts and can adapt himself to a certain extent to the ways of the country. There is plenty of game, large and small, and the rivers teem with fish of large size. At the same time, it must be remembered that there is not the same security for life and property—at least in the country districts—that

obtains in England; though Paraguay is no worse than other parts of South America in this respect.

The writer, who has travelled over a great part of Paraguay, prefers Villa Rica, the second town in the republic, as a place of residence, especially for invalids. It lies in the centre of a fertile district. The surrounding country is gently undulating, though in the background, only a few hours' ride distant, is one of the highest mountain ranges in Paraguay. The cost of living is much less than in Asuncion, the capital, and the advantages of Villa Rica will be increased when the new railway is opened, for it will then be brought nearer to England than any other town of the River Plate republics.

Of the other regions named the writer can only speak from hearsay. Matto Grosso, which has an active trade with Paraguay, is an undeveloped country, cattle-farming being the main industry; a great part of the surface consists of a plateau, with a pleasant and healthy climate. Gold is found, and was formerly worked to some extent; there are also forests of rubber. The country is only partially explored, and there is little doubt that the advent of the railway will effect a great transformation. It is sufficient to cite the case of the Canadian West, where large and prosperous cities exist in what only a few years ago was a wilderness, the change being entirely due to the railway. All the regions mentioned have a climate superior to that of Canada, and an equally fertile soil; and they are permeated by rivers permanently navigable to the sea. Railway construction is just as necessary for the development of the land in South America as in other parts of the world; without railways the wheat-fields of Argentina would be barren and uncultivated. The prosperity of Brazil is founded in a great measure on coffee; but the coffee-lands are all in the interior, and without railways they would be valueless. Even to-day one can buy fine coffee-lands cheap in the interior of São Paulo, but it is because their remoteness from a railway makes their cultivation impracticable. On the other hand, good coffee-lands close to a railway fetch very high prices.

Another good feature of the railways in South America is that they are powerful aids to the political stability of the countries they traverse. It may be taken as an axiom regarding that part of the world that 'the more railways a country has, the fewer revolutions.' Railways tend to prevent revolutions, because, in the first place, they bring in their train the European immigrants who form the peaceful part of the population; and, secondly, because by making the country more accessible they make revolutions more difficult, as these outbreaks generally originate in the remoter parts. Every mile of the railways in South America is built through productive country; every mile can be made to yield a revenue. In Australia, railways have been built through hundreds of miles of worthless country to reach some mining township, with a very doubtful future, situated in the remote interior. In South America it cannot be said that railways have been built in advance of the needs of the population.

THE BANDIT AND THE LADY.

A TALE OF THE CAMORRA.

By Frank Hird.

CHAPTER I.

'THE signore has asked for the best vintage. Behold, there it is!' and, stepping back, the landlord gazed with admiration upon the flask of amber-coloured wine he had placed before George Tredare. 'And not only the best in the *osteria*, but in the whole province! One vineyard in all Calabria alone produces that wine; and, behold, that vineyard is mine! Ah, I see,' he cried joyfully, as Tredare, with the discrimination of a connoisseur, smelt the wine, 'the signore has a knowledge. Not one in a thousand cares for the bouquet of a wine. But the signore understands! Is it not a king amongst wines?'

'It is so good,' Tredare answered, putting down his glass, 'that it would be an insult to the wine to drink it alone. You must honour your vineyard by sitting down and sharing the flask with me.'

The man and his whole-souled enthusiasm for his wine interested Tredare. Past the middle age, as he was, a growing corpulency had not yet robbed him of his strength and muscle. In his youth he must have been singularly handsome; and although his aquiline face was now heavily lined and wrinkled out of all comeliness, his black eyes were as brilliant and as flashing as ever they could have been in his youth. Both in manner and speech, as well as in appearance, the man was utterly unlike the usual type of landlords in Italian country inns.

With a courteous bow, the landlord seated himself, and taking the glass Tredare had filled for him, held it up, saying, 'To your health, signore!'

'And to yours!' rejoined Tredare.

The two men clinked glasses. There was a pause as they each revelled in the exquisite flavour.

'*Ma che*,' said the landlord, 'but what a wine! It seems a sin to swallow it.'

Tredare laughed. 'It is certainly worth a visit to Ferentola,' he said.

'What is the signore doing in such an out-of-the-way place as Ferentola?' asked the landlord, with the eager curiosity exhibited by all classes of Italians in the doings of strangers.

'There is a wonderful painting of the Madonna in the church, they tell me,' answered Tredare. 'I have come to see it.'

'The signore is a foreigner?'

'Yes; English.'

'And you have come all the way from England to see our Madonna at Ferentola?'

Tredare laughed again. 'Not exactly from England. I have come here from Naples.'

'From Naples? But foreigners never come to Ferentola!' The landlord's amiability had suddenly vanished; his expression was suspicious, almost menacing. 'You have come here from Naples?' he repeated, his heavy, black eyebrows meeting in an ugly frown.

'Yes,' replied Tredare, sipping the cherished wine; 'and a most tiresome journey it is. Here you are not two hundred miles from Naples as the crow flies, yet it has taken me four days to get here. Five miles away the diligence broke down; so I walked.'

'You have travelled for four days, you have walked for five miles through the dust and the heat, simply to see the Madonna in our church!' The landlord made no attempt to disguise his incredulity. 'Do you think I am the son of a sheep?' he asked fiercely. 'Do you think I will believe such a story?'

Tredare stared at the man in amazement. 'It is indifferent to me whether you believe me or not,' he said haughtily. Rising, he threw a silver coin upon the table. 'I have no doubt I shall find as good an inn and a landlord with better manners in Ferentola. Which is the way to the town?'

The man had risen also. 'Which is the way to the town?' he repeated. 'The signore knows that as well as I do, seeing he must have passed through the town to get here.'

Tredare looked at the man keenly. Was he mad? Why should he question every statement in this curious way. 'The diligence broke down at Lesino,' he replied coldly; 'the driver showed me a path over the mountains, which he said was a short cut to Ferentola. I followed the path. It brought me through a ravine; at the end I found myself opposite to your door.'

The landlord looked at Tredare doubtfully. 'That is true,' he said; 'I had forgotten the mountain-path.'

'I must stay two, perhaps three, days at Ferentola in order to study the Madonna,' Tredare went on. 'The conductor recommended your inn as better and cleaner than those in the town. But he did not tell me that its *padrone* doubted the word of his guests.'

'Nor does he, signore.' The landlord hesitated, muttering, 'But to come all the way from Naples to Ferentola to see a dirty old picture! To come from Naples where *they* are, to Ferentola where *I* am! It is very strange. You look honest, signore,' he said at length to Tredare.

'Thank you,' retorted the latter. 'Perhaps now you have assured yourself as to the honesty of my looks, you will tell me your reason for doubting my word?'

The landlord eyed him narrowly, then asked slowly, lowering his voice, 'Has the signore ever heard of the Camorra?'

'Of course I have,' Tredare replied impatiently. 'Nobody can be in Naples for a week without hearing of the society and its doings.'

'Is there a Camorra in England?'

Tredare laughed outright. 'No, my friend; there is no Camorra in England, nor any secret society like it. We don't hire people in England to stab our enemies and rob people we have a grudge against.'

For answer, the man held his hands straight in front of him with the two forefingers crossed one over the other; then clenching his hands, he placed the right fist upon the left; then he slowly stroked his left ear with his right forefinger, all the while watching Tredare intently.

Tredare's face was eloquent with wonder.

'Ah!' the landlord cried, throwing his arms wide with a gesture of unspeakable relief, 'I see the signore is not of the Camorra. If he had been, his vows would have compelled him to answer the signs I have given, even though he had been sent to murder me.'

'Do you mean to say you thought I was a member of the Camorra?' Tredare shouted.

'I suspected.'

'How dare you? Suspect me of being a member of a gang of thieves, murderers, and blackmailers! I, an Englishman! In Heaven's name, why?'

'Because the signore came from Naples to Ferentola.'

A sudden thought came to Tredare. 'Then you have reason to fear the Camorra?' he asked.

'Most assuredly, else I should not have suspected the signore.'

'Humph!' said Tredare, looking at the landlord with contempt. 'A case of a guilty conscience.'

There was something pathetic in the expression of the man's eyes, something that touched Tredare as he looked round the *loggia*, with its red-tiled floor and its whitewashed columns of brick that, rising from a low wall, supported a *pergola*, over which a vine grew luxuriantly, its leaves casting dappled shadows below. Oleanders, a blaze of rose-pink blossom, stood in green tubs between the columns, and the low wall was smothered by the riotous crimson of a hedge of geraniums whose roots were in the terrace many feet below.

The wall of the inn formed the back of the *loggia*, and was covered with a trellis over which roses clambered until their flowers mingled with the vine-leaves above.

The inn was built upon a spur of land rising high above a ravine, across which the high-road, inches deep in white dust, was carried on a many-arched bridge. Mountains, whose lower slopes were covered with thick woods, but whose summits were gauntly yellow and gray, shut in the view on all sides. The scene was desolate, but the warmth and glow of a Calabrian May gave it a peculiar beauty. On either side of the ravine the land was cut into terraces, and each terrace was a band of vivid green, the exquisite green of young corn and vine-leaves.

Here and there lofty cypresses stood out inkily black against the radiant blue of the sky, bees were droning amongst the roses, from a pond near by came the croaking of frogs, and over all was the sunshine, so vivid, so clear, and intense that it seemed to be a vital, living essence, the sunshine of Southern Italy in the spring-time.

'I have passed three happy years here, in the house where I was born,' the landlord said. 'But the Camorra never forget. And a stranger from Naples—it made me suspect'—— He paused, then bowed. 'I crave a thousand pardons, signore.'

'Then you are assured I do not want to cut your throat?'

'I will take the signore's word for it. Shall we not finish the wine?'

By the time the flask of the famous Val di Ferentola was finished it was close upon midday. It was useless, therefore, the landlord said, for Tredare to trudge through the dust to the town, half a mile away. The picture of the Madonna was in the sacristy, the key of which was kept by the priest, and he, excellent man that he was, took a siesta after luncheon, and was never seen by man or beast before three o'clock on any afternoon. So the signore might remain in comfort where he was, instead of kicking his heels in the dirty town waiting for the *padre* to finish his siesta.

Tredare was tired. The journey from Naples had not only been long, but it had been supremely fatiguing. This Osteria dei Fiori, where he had undergone the unique experience of being suspected to be a Camorrist, was the first clean inn which had sheltered him since he had left Naples four days before. The landlord interested him. He was clearly a Camorrist himself, yet he was in such terror of the Camorra that the mere fact of a stranger coming to Ferentola from Naples, where the great secret society had its headquarters, filled him with alarm and suspicion.

Tredare was a man of means. The engrossing interest of his life ever since he had left Oxford had been the study of Italian painting in the Middle Ages. In the course of fourteen years, by sheer hard work and constant residence in Italy, he had become an authority on the subject, an authority whose opinion was regarded as final in the museums and picture-galleries throughout Europe. He spared himself no trouble or fatigue in the fulfilment of the secret ambition of his life, which was to leave the world a complete story of the lives of the painters who had worked in those misty days before the splendour and magnificence of the Renaissance had burst upon Italy, as well as a complete list of their works.

Whilst in Naples he had come across, in an old treatise upon painting, a reference to a painter whose works were extremely rare, and only known to himself. A Madonna from this painter's brush was spoken of in terms of high praise; it was described as being painted especially for the church at Ferentola, where it still hung. The treatise was written late in the sixteenth century; and knowing from experience that sacred pictures often remained for hundreds of years in the Italian churches in which they had been originally placed, Tredare decided to visit Ferentola, a small town in a remote part of Calabria, the exact whereabouts of which he only discovered by a diligent search upon the map of that province.

At three o'clock the sun had passed behind the mountains, leaving the dusty road, which led over the bridge across the ravine, in deep and cool shadow. Tredare set out for Ferentola, with many directions from the landlord for finding the priest's house, and with the assurance that when he returned he would find his luggage safely delivered at the Osteria dei Fiori.

Seen from a distance, Ferentola was a town of great picturesqueness. White houses with red-tiled roofs and green jalousies rose in quaintly broken terraces from a large square, one side of which was entirely filled by the church, which, with its high dome and solid walls covered with yellow stucco, had the appearance of having been built for the sole purpose of preventing the town from slipping down the steep mountain-side. But on closer acquaintance, Tredare found that Ferentola, like so many hill-towns in southern Italy, was the dwelling-place of dirt unspeakable, the houses being occupied by pigs, donkeys, fowls, and human beings, apparently on terms of socialistic equality.

He found the priest, a fat, amiable man, whose greasy cassock and general appearance showed only too plainly that he was neither a guide nor an example to his flock in cleanliness, and was duly shown the picture of the Madonna.

This story in no way concerns the Madonna of Ferentola, that wonderful picture whose discovery by Tredare on this particular May afternoon caused a sensation in art circles throughout Europe. The subsequent sale of the picture to Tredare, the plots and counterplots that were embarked upon to aid and to prevent its passage out of Italy, make a little history by themselves.

The fat, amiable, but dirty priest who showed Tredare the picture in the sacristy of San Zaccharia is of more importance in this true history of the landlord of the Osteria dei Fiori than the now world-wide famous painting of the Madonna of Ferentola.

After as close an inspection as the dim light in the sacristy permitted, Tredare, with the promise that on the morrow the picture should be taken down for nearer examination, took his leave of the priest.

'Where is the signore staying in Ferentola?' the latter asked.

'I am staying at the Osteria dei Fiori, outside the town,' Tredare replied.

The priest pursed up his lips, held his head on one side, and gently smote an unshaven cheek with a very dirty hand. '*Ma che!*' he muttered; 'the signore is staying at the *osteria* of Beppo Cavalanci?'

Tredare, remembering the landlord's suspicion that he, an Englishman, was a member of the Camorra, felt uncomfortable, but he said lightly, 'I know nothing of the Signore Cavalanci. I only arrived at Ferentola this morning, and the driver of the diligence recommended his *osteria* to me.'

The priest threw up his hands in a gesture of dismay. 'Satan himself must have kissed the lips of the driver of the diligence, else he could never have recommended the Osteria dei Fiori to the signore! Two years ago Beppo Cavalanci was a brigand, and a proscribed murderer with a price upon his head, hiding amongst the mountains here, and the terror of two whole provinces. The *carabinieri* had orders to shoot him at sight. Our *podestà* of Ferentola received a telegram from Naples after Beppo had robbed the diligence within two miles of the town: "The brigand Cavalanci is to be shot, then captured."'

Tredare shrugged his shoulders.

'It is true,' the priest protested; 'I saw it with my own eyes. That telegram meant that the *podestà*, the town authorities, and the *carabinieri* were given a free hand; it meant that they were to *kill* Cavalanci! And then what happens? Cavalanci disappears. Nothing is heard of him in Ferentola for months. Then suddenly a letter comes to the *podestà* from Naples, with a big Government seal upon the back. There is a secret meeting of the town-council, and we others are told that Beppo Cavalanci has made his submission, that he has renounced all brigandage, and that the Government have swept the *velo d'oblio* [the veil of oblivion] over his past life. The *podestà* and the town-council calmly tell us that Beppo Cavalanci has been made an honest man, and that without so much as the quiver of an eyelid! Signore, I ask you if this is justice.'

'It seems a very unusual proceeding,' Tredare remarked guardedly. He thought the priest was romancing.

'And not only is he pardoned all his crimes, but Beppo Cavalanci has the effrontery to return to Ferentola and take the inn formerly kept by his father, and in which he himself was born. Beppo has not only been made honest, but he has been made rich. Yes,' added the priest with a hissing vindictiveness; 'Beppo has been made rich, and of his riches he gives nothing to the Church.'

'Here,' thought Tredare, 'lies the cause of this amiable-looking gentleman's malice.'

'And the signore will trust himself in the house of such a man after all I have told him?' the priest asked.

'Certainly,' rejoined Tredare. 'The Osteria dei Fiori is clean; and if Cavalanci is the brigand you say he is, he will find that I am not worth either robbing or murdering. *Addio, Signor Prete!*' He was about to add, 'And may Heaven send you a kinder tongue,' when he remembered that it would be unwise to provoke the spite of the custodian of the wonderful Madonna.

(To be continued.)

SOME EPISODES IN LITERARY MYSTIFICATION.

'PRAY burn this letter, as I trust you may do with many others from me. See after the destruction of the manuscript in the printer's hands.' So wrote Dr Robert Chambers to his confidential friend Alexander Ireland, of Manchester, through whom were made all the negotiations with Savill the printer and Churchill the publisher of his anonymous *Vestiges of the Natural History of Creation*. The manuscript of the work may have been destroyed, but the letters were not, and, bound in three crown octavo volumes, they are now in the possession of the author's grandson, through whose courtesy an examination of them has been made for this article. The letters, frequently beginning, 'My dear Alexius,' are grave, gay, serious, often deal strictly with the business on hand, and not infrequently give sidelights on men and things beyond. As all the letters are more or less autobiographical, they reveal the character of the writer as not only the industrious and capable man of letters, but as the genial, warm-hearted friend, who loved a good laugh, a good story, and a good dinner, and all the cheery intercourse of daily life. No wonder James Payn dubbed Robert Chambers the 'Well-wisher,' for he took such an unselfish interest in the prosperity and well-being of his many friends.

The flames of the old controversy which raged round the *Vestiges* when published anonymously in 1844 are now extinguished, never to be rekindled, and some of the positions then maintained are the commonplaces of science. As the author reverently said in a sequel, he was only endeavouring to read another chapter of the mystic book which God has placed under the attention of His creatures. To have published a work of this nature under his own name and at that time might have injured the business with which he was connected. The secret of its authorship was known, therefore, to but five others, namely, the wife of the writer, his brother William, Mr Robert Cox (George Combe's nephew, who in the letters is called Robertus), Dr Neil Arnott, and David Page. When all who knew the facts had passed away save Alexander Ireland (1810–94), this literary go-between revealed the authorship, and in the preface to a twelfth edition (1884) gave a narrative of the circumstances under which the book was originally written and published. Of the previous eleven editions about twenty-four thousand copies were printed and sold. Darwin, in his historical introduction to the *Origin of Species*, says that the book, from its 'powerful and brilliant style,' immediately had a very wide circulation.

Alexander Ireland, business man, journalist, and man of letters, was a native of Edinburgh, who in 1843 removed to Manchester to represent a Huddersfield firm. In 1846 he succeeded Sir Edward Watkin as publisher and business manager of the *Manchester Examiner*, which later went down before the *Manchester Guardian*. Ireland prepared bibliographies of the works of Leigh Hunt and Hazlitt, and his *Book-Lover's Enchiridion* is known to all lovers of books. He also issued a memorial volume on Emerson. Besides gaining the confidence and warm friendship of Robert Chambers, he knew Carlyle and Leigh Hunt; and during Emerson's English visits he acted as cicerone and lecture-agent to the American transcendentalist, and approved himself as 'the king of all friends and helpful agents, the most active, invincible, imperturbable.' Robert Chambers wrote to him in 1846 that he would far rather see him in a purely business situation, whether connected with a newspaper or otherwise, than in anything like a literary position. 'Avoid that in all shapes, for any sake. Compared with a clever, active man of business, a slave of the press is a poor devil indeed.' The suggestion was also made that an opening might be found for him in the publishing house of W. & R. Chambers, 'taking the rigid charge which they could hardly do.' This did not come off, and Ireland in later life endured with patience and fortitude some of the slings and arrows of outrageous fortune. 'A Gilchristiad'—meaning a Pentland walk, taking Mrs Gilchrist's place of refreshment at Woodhouselee by the way—was a favourite recreation of the friends when Ireland was in Edinburgh. The meeting-place was frequently at Morningside Parish Church about 8.30 A.M., and many an exhilarating day was spent on the Pentlands by Chambers, Ireland, Dr Hodgson, Cox, and Professor Pillans. The doleful news is imparted in one of the letters that Robertus had been out at Gilchrist's, and the ham was not so good as it used to be!

Sir W. Robertson Nicoll, who has written well and appreciatively of the work of William and Robert Chambers, terms Robert a bigger man than his brother, and says few men better deserve honour intellectually and in other ways. He is wrong, however, in attributing to him a paper in the *Journal* on 'Mornings with Thomas Campbell,' for this was by his friend Robert Carruthers of Inverness. He asked once, could 'In Memoriam' have been written without Robert Chambers? The memoir of Tennyson scarcely justifies the importance of the question. We find Tennyson writing in November 1844 to his publisher, Moxon, asking him to get a book he saw advertised in the *Examiner*; 'for it seemed to contain many speculations with which he had been familiar for years, and on which he had written more than one poem. The book is called *Vestiges of the Natural History of Creation*, and published by J. Churchill, Princes Street, Soho, the price seven-and-six; but you can get it cheaper.' Tennyson's son, commenting on this, says that the sections of 'In Memoriam' about evolution had been read by his friends some years before the publication of the *Vestiges*. Romanes writes that in 'In Memoriam' Tennyson noted the fact, and a few years later Darwin supplied the explanation. Robert Chambers, however, who preceded Darwin, was a pioneer in the same line of observation. Genial and usually mild-tempered, in these letters he lets himself go in reference to some of his critics, as well as about David Page and his divulging of the secret, and about Alexander Russel of the *Scotsman* when he published a gross attack upon him (1854), the circumstances of which are now obscure and forgotten. Robert Chambers's opinion of Russel we do not quote, save this: 'Of course, what he did was the more brutal, considering that I was an occasional friendly contributor to his paper.' A friendly howff was Blackford Farm, then tenanted by Ireland's parents. 'I met Emerson last night at the governor's, and spent a very pleasant hour with him, after which we had a moonlight walk through the town. I like him very much. He is to be with us on Wednesday to meet Samuel Brown and Mrs Crowe.' Chambers was impressed by the fine, intellectual aspect of Jacob Bright, 'particularly the eyes, which are remarkable.' At another time he writes: 'We had John Bright and his sisters dining with us yesterday, and liked them very much. I had them through the Old

Town, and also the printing-office. It was a great pleasure to see such interesting persons as they, but particularly as they are your friends.' Ireland's newspaper, the *Manchester Examiner*, was identified with the views of Cobden and Bright.

Both Robert Chambers and Alexander Ireland enjoyed the remarks they heard about the anonymous book and the attempts made to fasten the authorship upon various eminent persons such as Prince Albert, Sir Charles Lyall, Professor Nichol, and others. Dr Forbes, the great medical editor, asked Dr Combe about that singular book, and said that either Combe or Diabolus had done it. Henry Greville noted in his diary (1847) that Mrs Butler gave Robert Chambers the credit of writing not only it, but also the novel *Jane Eyre*, then in the first blush of its great reputation. Walter White said, with a trifle of exaggeration, that no book had created such a sensation in London since *Waverley*. Some one wrote to the *Witness* newspaper identifying Chambers with the authorship at a time when his name had been proposed for the Lord Provostship of Edinburgh. M'Phail's ecclesiastical magazine was especially bitter; but the author secretly congratulated himself that, let them all do their worst—and many did their worst—he could not now be condemned to utter poverty. A divinity professor from St Andrews said to him (1847), 'Have you seen the horrible book?' The bustle of the moment saved him from giving a direct reply. He had kept his expectations low, and was gratified at the unequivocal success. The author 'capers in thought at the idea of Lockhart's note, considering how the serpent would speak of him at this moment as the author of all he has written besides the *opus*.' He was irritated from time to time because Churchill the publisher made no formal statement of the progress of sales, and was dilatory in connection with new editions. He was as keenly interested in hearing about the sales as George Eliot seems to have been about the sales of her various books, and bitterly disappointed when no copies were to be seen in the shop of Churchill's Edinburgh agents (Maclachlan & Stewart).

When residing for a day or two at Rossie Priory in 1850 Chambers's room was next door to that of Sir David Brewster, who was at the time writing for the *North British Review* on *Footprints of the Creator*, Hugh Miller's counterblast to the *Vestiges*. Also, he was 'exposing his sentiments on the horrible work which Mr Miller endeavours to refute. Sir David was also to make remarks on my *Ancient Sea Margins*, and a few other late geological works. He consulted me about the leading facts of my *Sea Margins*, and a few other later geological works, for which I gave him written memoranda. We had discussions at table about the *Vestiges*. I battled against his idea that the work is atheistical, but with little success. It was, however, gratifying to find that he acquitted me of all suspicion of having written that atrocious book. It was queer having such a critique in process next door to me.' It was evident that Professor Nichol had guessed the secret, for when told what Samuel Brown had said about the author being 'a residuary clergyman residing near Dundee,' he replied, 'No, but one who from other literary engagements had equally good reason to keep quiet.' In walking home with Mrs Crowe from a lecture by Nichol, Chambers asked her if she thought from the lecturer's style there was the least chance of his being considered the author of the *Vestiges*. Mrs Crowe replied, 'Oh, it is now generally given to you,' which the author turned off with a 'slight observation.' Leigh Hunt in his hearing had spoken 'moderately of the book before the company, but let himself out more warmly when we were by ourselves.'

Mrs Crosland (here we go outside the letters) mentions a dinner at Doune Terrace: 'When the fish was removed, the time when tongues are loosened, the *Vestiges* came under discussion. A quarter of lamb was set before the master of the house—for dinners *à la Russe* had not yet been introduced—and he was in the act of separating the shoulder from the ribs with the skilful dexterity of an accomplished carver, when some lady at the upper end of the table, with singular impropriety, exclaimed, "Do you know, Mr Chambers, some people say you wrote that book." Though sitting next my host, I happened to be looking towards Mrs Chambers, and I saw that she started in her chair and that a frown was on her face. She looked at her husband, but his eyes were bent on the lamb, on which he continued operating in an imperturbable manner, observing, "I wonder how people can suppose that I ever had time to write such a book." There was silence for a minute, and then I think the subject dropped. I believe I have never since seen a quarter of lamb without thinking of that dinner and Robert Chambers's evasive answer. Now that the book is acknowledged to have been his, and his wife is said to have been the copyist, I can well understand her start and her frown.'

Sir John Herschel, at a scientific meeting in London, once assailed it on astronomical grounds and then on the development theory, and spoke strongly. Dr W. B. Carpenter, who had revised the physiological sections of the book, said to Robert Chambers on coming out from the meeting, 'So the poor author of the *Vestiges* has got it in all directions to-night.' Chambers replied, 'Yes; it would be curious if he were present to hear it all.' To which Carpenter replied, nudging his elbow, 'Some people say he is not far from me at this moment,' evidently meaning Chambers, who laughed and said, 'What you say might have two meanings.' But in telling Ireland he continued: 'I have denied it out and out. All this is curious, isn't it? Strange to walk about amidst all the jumping-jacks and be pulling grand strings, causing people to wonder, and yet be

unseen, unknown, all this time, *if I be so now!*' Again: 'At Cox's, at Gorgie, Mr Maclaren (of the *Scotsman*) told Mr Combe across the table that he had heard that suspicion had now settled upon Dr Neil Arnott. One of the Adies had told Mr Maclaren; how Robert Cox and I enjoyed it!' Robert Chambers had lent money to Ireland; and besides this, when making a remittance for his trouble as literary agent, he wrote: 'It is bad enough for you to have sinned your precious soul past redemption by your concern in the fearful conspiracy without having, in addition, to incur the expenses of damnation thereanent.'

It was David Page, who had been on the literary staff of Messrs W. & R. Chambers, who made, in the *Athenæum* of 2nd December 1854, the first explicit statement regarding the authorship of the book. This, in the letters, is termed 'a shocking piece of malice;' and Robert, on consulting his brother William, decided to take no notice of the offending allegation. It may be as well here to refute a statement by the Rev. Professor Bonney, in the article on Page in the *Dictionary of National Biography*, to the effect that Page aided Robert Chambers in writing the book. The account in the letters is to the effect that he was only taken into confidence after one or two editions had been issued, and for the sake of making some necessary revision. The *Athenæum* paragraph of 1854, supplied by Page, bears that he did not see the book until after it was published. If he had had any share in the authorship he would not have here concealed his light under a bushel.

Here are a few other items ere we close. It was a tribute to the critical acumen of the conductors of *Chambers's Journal* that in 1854 they made a bid for the services of Mrs Gaskell, whose famous *Cranford* had just run its course in *Household Words*. She was approached through Ireland. 'Do you know Mrs Gaskell? If so, could you oblige us by making overtures from us for a novel from her pen to appear in successive numbers of the *Journal*? It would save us the awkwardness of addressing a lady to whom we are strangers. If not, at least you can give me her address. We are willing to give a fair sum for the privilege of even printing the work first in the *Journal*.' Nothing seems to have come of these overtures. Other interesting items are that the impression of *Chambers's Repository of Tracts* had 'reached the astounding number of one hundred and eighty thousand, which would require for itself six machines, whereas we have but five altogether. We are actually getting work done in Glasgow, besides employing two neighbour offices in Edinburgh. It is certainly our greatest hit yet.' This in 1851 is not so sanguine: '*The Papers for the People* might have been continued further if a little more successful. The sale is only thirty-three thousand, which pays but barely. This alone is a further illustration of the evil effects of the paper-duty, which shoves us out of the penny field.' And this in 1854: 'During the Russian war the increase of the price of paper was as much as seven hundred and fifty pounds a year out of our pockets, a sad contrast to our hopes of getting the duty off.' Two years later Chambers reports that their history of the Russian war was having a sale of twenty thousand. 'Now that we are quit of Orr, and are sure of getting back our money when we lay it out, we are going more freely into the publishing business than we did before.' In 1858 a *Times* article had caused an increased demand for the first two volumes of *Domestic Annals of Scotland*. 'I am doing a little now and again towards a third volume, and contemplate a similar work about England, a task of years; but nothing agrees with me so well as hard work.'

Less than ten years later came a more mournful strain: 'I have not been doing anything in a literary way at all, and probably never will again do much, for it would appear that my nervous system has been permanently taken down by over-exertion in past days. . . . Pray do you take this warning, for you are not the same thing between fifty and sixty as between thirty and forty. My great mistake was in undertaking the *Book of Days*.' A year later: 'I suppose I had spent in forty years of active literary life the nervous energy that should have been extended over sixty, and so here I am, a bankrupt in the vital forces, and nothing better than one of my own characters, "The Old Gentleman that Pops About." Nothing, however, can take from me the character of your sincere friend.' It may have been the same feeling on the part of Alexander Ireland that prevented him from destroying these voluminous notes, though urged to do so, regarding the *Vestiges* and other matters, a peep into which makes us think all the more kindly of the two friends.

THE SEVEN-STONE CHARM.

By Colonel STANLEY PATERSON.

OVER the jungle-clad Ghâts, across the hot, dry plains of Central India, through the prosperous cultivation of the United Provinces, away into the arid Punjab, heedless alike of the dark, stuffy night, the cool, gray morning haze, and the flaming heat of the midday sun, the mail-train steamed steadily northward, carrying the weekly news, good or evil, of friends in far-away England to the weary sojourners in the uttermost outposts of our Eastern Empire.

In our carriage all the windows were tightly closed; the well-soaked *tatties* were drawing freely, filling the confined space with a pungent smell of cuscus; five of the six venetians were drawn up to exclude the blinding glare, leaving but one blue glass window available for inspection of the burning world outside; while we four passengers—three old stagers (yellow and drawn) and a pink-and-white, full-blooded 'griffin' (an earnest young M.P. freshly out from London by the last boat)—lay stretched in our respective corners attired in the airiest possible clothing common decency would permit, languidly helping ourselves at intervals to the contents of the indispensable ice-box that lay handy under the seat, the 'griffin' panting and dripping in the unaccustomed heat. As it was certain he would follow the way of his kind, and on return to England pose as an authority on all matters appertaining to India, or in all probability write (from the ripe experience of a six weeks' tour along the beaten track) a book dealing with the many complicated questions of our rule in the East, the Commissioner and I, suppressing the lurking twinkle in our eyes and our fearful joy when pencil and note-book came rapidly into requisition, were relating to him many remarkable facts regarding the ways, manners, religion, &c. of the natives, our tyrannical methods of rule, and anything else that came into our heads to while away the tedium of the journey. We stopped at a station, an ordinary wayside station. How irritatingly alike all these stations are to the fagged Anglo-Indian traveller, with their crowd of sweating, chattering, quaintly robed natives struggling for places in the semi-cattle-carriages already packed to thrice their carrying capacity, into which the station officials have to shove them by sheer force through a dense array of heads and forms at every window shouting to the station water-carriers or trying hard to buy from the platform hawkers some of those sticky, unappetising sweets so dear to the native palate! All over the platform another crowd lay or squatted, patiently awaiting the arrival of a train due probably in four or five hours' time, while in a more secluded corner, apparently utterly oblivious of the bustle around him, sat an old ash-smeared fakir, begging, bowl in hand, and with a peculiar silver ornament hung by a cord round his neck.

We were just beginning to relate for the benefit of our 'griffin' some highly imaginative tales regarding these *yogis* or holy men, when we were astonished to see the Public Works official, a grave man who seldom spoke, staring intently through the window at the unconscious fakir, and then, as the train moved on, sink back in his seat, saying, 'I never heard of but one other charm like that, and it had a queer story—I don't know if it is ended yet.'

We immediately stopped our banter, and begged the yarn, settling ourselves comfortably down to listen, well knowing that any tale the P.W.O. might tell would be well worth the hearing.

'A good number of years ago,' he began—'I should not like to say how many, they do pass so quickly, somehow—my brother Sam, riding quietly home after a hard morning's pig-sticking, passed by a solitary jungle-hut, in front of which, playing with the wax-like flowers fallen from a shady *mowha* tree overhead, sat a small brown baby nature-nude except for a curious silver ornament secured by a silken cord round his fat little middle. Such an everyday sight would usually have passed unnoticed; but at the moment of passing Sam's quick eye detected a movement in the dry grass immediately in front of the babe; then suddenly a tall cobra reared its ugly head, hood expanded, in the attitude of striking. In a flash Sam had sprung from his horse, dragged the child toward him, and with a swift blow of his stout riding-whip laid the reptile dead at his feet. But too late. Quick as he had been, the cobra had been quicker; and, ere the child had reached safety, with all the strength of its tensely coiled muscles it struck.

'The screams of the terrified infant brought a very old man hobbling out of the hut. With a rapid glance he seemed to take in the situation, and without a word knelt beside Sam, who was vainly endeavouring to search the vigorously struggling child for the serpent-made wound. Great-grandpapa—for so he proved to be—spent no time in looking at the little lad's skin, but immediately inspected the ornament, which he detached and handed to my brother, saying, "It is as I thought, Huzoor—the child is unhurt; this has saved him. See, here struck the snake," he added, pointing to a tiny drop of moisture lying in a small hollow in the silver.

'The ornament was a hexagonal piece of silver about the size of a rupee. On each face of the hexagon and on the centre space was rudely embossed the figure of some god, and let into the middle of four of these figures was a peculiar small green stone; from the other three the stones were missing, a shallow cup in the silver alone marking the place where they had been. In one of these cups lay the drop of venom.

'While soothing and comforting the still-wailing babe, the old man told of the charm. It had been given to his father many years ago by a wandering *yogi*, who declared he had found it in one of the old Jain temples in the south, sealed up in a small copper casket along with an ancient writing which stated that so long as a stone remained in the charm death would, on one occasion, pass by the wearer; but that whenever a stone disappeared the charm must at once be passed on. Why the *yogi* gave the charm, or what death his father escaped, the old man knew not; but, as he said, "Sahib, my father belonged to the Kshatriya or fighting caste, and in those

days there was no lack of perils for such as he. As it was, he died in battle while I was still a boy, having some time before his death fastened the charm round my neck. There I wore it for more years than I can count; because, Huzoor, though I am a Kshatriya, I am a man of peace, and have lived by tilling the ground; therefore, perhaps, deadly danger has not come nigh to me. But two years ago came the great sickness, and amongst our villagers it struck like a murrain in cattle. I was one of the first to sicken, and when death seemed certain those of my household carried me out in the night-time and laid me in the street, because, as you know, Huzoor, on account of the Government order, we people like not that any be found dead of the plague in our houses. And in the early dawn the buffaloes and cattle driven out to the grazing passed over me; for though they snorted and edged away in fear, still in the crush one put its foot lightly upon me. And at once I felt a new life come into me, and painfully crawled back to my house, where I lay all day half-conscious. That night there was no one to carry me out again; the great sickness had taken them all, man, woman, and child, and only this babe was left to me. And from the charm a stone was missing. So I fastened the charm round the child, for I had no one else to give it to; but, now that his turn is past, to whom can I better give it than to you, Huzoor, whose kindness helped to save him?"

'Sam, though distinctly sceptical and inclined to laugh at the tale, accepted the trinket chiefly not to offend the old man, hung it on his watch-chain, pulled out a couple of rupees as an exchange-present, rode on his way, and dismissed the affair from his mind.

'Some five years later he was engaged as one of the engineers building the great railway bridge over the Indus. On his section the huge iron girders had been swung into position, and swarms of half-naked workers were busy riveting and making secure the superstructure. Walking along the foot-plank laid on the girders at a dizzy height above the river, he was supervising the work above, when a frenzied cry of warning made him instinctively spring back, nearly losing his balance in the act. Just in time. A whiz, a slight tug at his watch-chain, and a heavy sledge-hammer which had slipped from the hand of some careless workman, touching his clothes, went hurtling down into the roaring torrent beneath. It was a narrow escape, and somehow his thoughts went flying back to the almost forgotten charm. He looked; the chain was snapped, the charm still hanging on the broken link, but another stone had gone.

'By next mail the little bit of silver went home to our sister, to whom Sam was deeply attached, and for some years we in India heard nothing further of it. Then one day came a letter saying the sister in safe and prosaic England had barely escaped a peril so deadly that she refused to name it. But she was saved, another stone was missing, and the trinket had been passed on to her fiancé, a captain in a line regiment then on its way to the war which had newly broken out in South Africa. We all know what some of the fighting in that war was like, and especially have we all heard of that awful night on Spion Kop. Well, he was there, in the front line, with men dead and dying all around him; but death and wounds passed him by; only one bullet touched and apparently should have killed him, but it struck fair on the charm which he wore round his neck, and glanced harmlessly aside, carrying the sixth stone with it.

'The charm is now worn by his brother, also a soldier; but apparently death has not yet come within striking distance of him, for, so far as I know, the seventh stone still remains in its cup.

'Such is the story recalled by the sight of that old fakir, every word of which I can vouch for. It is unaccountable, I admit; though, as you know, not a few of these ascetic *yogis*, by some knowledge, power, necromancy, or devilry never vouchsafed to us white men, seem at times to get some faint grasp on the fringe of the inner order of things, producing results for which we can find no reasonable explanation.'

We old stagers were silent, feeling that we had again been permitted a rare glimpse into the practical mysticism so ever-present as to form an integral part of native life, but that seldom approaches sufficiently near even to impinge on the outskirts of our Western civilisation. So we nodded comprehendingly. But to the 'griffin' it was all rank superstition; therefore he talked long and loud of coincidence, auto-suggestion, and the like, and scoffed and refused belief. And when, one scorching night in the plains, we read the expected volume by the light of the punkah-lamps on the veranda of the commissioner's bungalow, and found that the one story that might have helped to some small insight into the back of the native's mind was carefully omitted, while the 'facts obtained from unimpeachable sources' were all duly elaborated, we grimly smiled one to another, and more than ever questioned the utility of matters Indian being dealt with in parliamentary debate.

AUTOMATIC ELECTRIC SUPPLY FOR COUNTRY HOUSES.

By W. O. HORSNAILL, A.M.I.Mech.E., A.M.I.E.E.

WE are all enamoured of the convenience and cleanliness of electric light, and nearly every householder within reach of a public supply who can afford it now uses electricity in place of paraffin or gas. Unfortunately, in the country districts no electric supplies are available; hence the advantages of electric lighting can only be obtained by making the electricity separately for each house. This has long since been done by the owners of large country mansions, but until recently no convenient apparatus has been available for the smaller householder. The difficulty hitherto has been, firstly, the amount of looking after that a private electric lighting plant demands; secondly, the large and costly battery needed in which to store the electricity ready for use. The private electric lighting plant consists of an oil-engine, which drives a dynamo, the current from the latter being used to fill up a large storage battery. In summer-time one batteryful may last a week, but during the dark evenings it will be necessary to 'charge' the battery perhaps every two days. This process involves the starting up of the engine and dynamo and running them for at least six hours, during which time a certain amount of attention is needed.

The most troublesome feature, however, is the care required by the battery, which may almost be said to want 'nursing' if good results are to be obtained; and even with the best attention deterioration is rapid, and costly renewals will be needed in a few years. Then, again, you cannot get the same amount of electricity out of a battery that you put in, some 40 per cent. being lost in this way. This loss entails a larger engine and dynamo than would be required if the lighting were done direct instead of through a battery, which means a bigger outlay to begin with and a higher annual cost for oil or petrol for the engine.

With the 'Lister' automatic electric lighting plant these drawbacks are entirely got over, and current can be made with scarcely any attention, whilst the lamps are lit direct from the dynamo, so that the big loss in the battery is avoided. There *is* a battery, certainly, but it is a very small affair, consisting of a few cells similar to those used on motor-cars for ignition. The engine and dynamo start themselves as soon as any lamps are turned on, and the battery is only used to run a few lights for a minute or two whilst the engine is getting up speed. When fairly running, the dynamo takes over the lighting and fills up the battery ready for another start. These operations are reversed when light is no longer needed, and the engine stops itself after all lamps are turned off at night. The only attention required consists in filling up the petrol tanks and oiling the bearings—say, ten minutes a day at the outside—whilst current is available for lighting at any time during the day or night.

The apparatus is really a novel combination of devices which have proved their reliability during years of practical work, so that no part is likely to go wrong; in fact, the plant was started and stopped by switching lamps on and off some thousands of times before it was placed on the market.

In addition to these advantages we have a low first cost, a great reduction in space, and a plant which requires no foundations; in fact, it is delivered practically ready for connecting up to the house wiring, hence it can be used within an hour or two of being unpacked, provided, of course, that the house is already fitted up with lamps and wiring.

BROKEN TOYS.

I AM so glad when children bring their toys
For me to mend;
When in sweet confidence they claim my aid
For some poor treasure, unafraid,
Knowing me 'friend.'
Then solemnly we set to work to see
How best the damage 'set to rights' may be.

To-day a little maiden brought her doll,
'Halt, lame, and blind,'
And told, with sobs of mingled wrath and woe,
How some wild playfellow had used it so
Rough and unkind.
'He 's always teasing me. He breaks my toys
Just for the fun of it. I *hate all* boys!'

'Twas such bad case not much my skill availed;
But I could take
The little mourner on my knees and try
With tender hands and words her tears to dry,
And strove to wake
Forgiving feelings in her wounded heart;
And soon I saw her, comforted, depart.

Then came another, with a tiny pipe
From which in vain
He strove a sound of melody to bring.
Blow as he would, 'twas but a poor dumb thing;
But when I took the pipe and showed him how
Against all laws
Of cleanliness and godliness, the dust
Into each secret part its way had thrust,
And was the cause
Why all his toil no tune thereon could play,
He was consoled, and, piping, went his way.

Then I, too, took my broken toys one night
Unto my 'Friend'—
Broken by other hands and by mine own.
'Master,' I said, ''tis Thou, and Thou alone,
These toys canst mend.'
Then on the motley heap He looked and smiled:
'Yea,' I was once *The Carpenter*, my child.'

THE CLOAKED MAN.

By the DOWAGER COUNTESS OF DUDLEY.

AMONGST the reports which in the month of February 1804 accumulated daily on the desk of Monsieur Réal, who was in charge of the Republican police, the cloaked man played an important part. He was reported to have been seen prowling about the Champs Elysées, others said they had met him during the night on the boulevard near the Church of the Madeleine, a further report stated that he was seen at the same hour in a deserted street in the vicinity of St Médard, and on one particular night he was described as having entered a café with a woman or as having dined in the company of an unfrocked monk. The unfortunate thing was that no one was able to say who this mysterious person could be.

Assuredly he must belong to the band of English adventurers who had come over to France for the purpose of murdering the First Consul. Or perhaps he was one of the Bourbon princes. But which one? The Duc d'Angoulême was in Courland; the Duc de Berri and the Comte d'Artois were in London; the Duc d'Enghein led a retired life in the Duchy of Baden; and they were all so carefully surrounded with spies that it appeared highly improbable that any one of them could have escaped without the French Government having been informed of the fact.

If Bonaparte's police were maintained at great cost, it must be confessed that they thoroughly earned their pay. At no period had espionage attained such a degree of perfection. Réal had at his disposal an immense number of men drawn from various sources: spies of the Revolutionary party left without employment, old Jacobins, ex-functionaries turned off on account of having been too zealous partisans of some one or other of the ephemeral régimes which during the last fifteen years had existed in France. Also, he could reckon on a number of deserters, amnestied Revolutionaries, and many others of the motley crew with which Paris swarmed, easily recognisable by the traditional cudgel, the beaver hat with buckle, the shaven face half-hidden in the dirty cravat, and with the butt-end of their pistols showing through the long, threadbare overcoat buttoned up to the chin.

In spite of this regiment of informers the enemies of the Government came and went, held counsel, and moved about with a facility which was truly stupefying. In those days the streets of Paris were well adapted for romantic adventures, and those who wished for concealment had not much difficulty in effecting their purpose. Therefore it happened that a considerable number of Chouans (Royalist insurgents) had passed the barriers without being questioned, had assembled in Paris, had established themselves in comfortable quarters, had ordered military uniforms from well-known tailors in the Palais Royal and frequented places of amusement. The police heard rumours of their escapades without having been able to lay hands on a single one of them.

On the 13th of February, however, it was rumoured that a Royalist who had been imprisoned for some time in the Temple had tried to hang himself with his long cravat knotted to the bars of his cell. A jailer, hearing the noise, entered the cell and cut the man down; when he was restored to consciousness he was seized with violent convulsions, and in his delirium revealed the whole plot.

The chief of the conspiracy was Georges Cadoudal, Moreau was one of the members, and the cloaked man was Pichegru. And it was Pichegru—Pichegru, the conqueror of Holland, the rival of Hoche in the Army of the Rhine; Pichegru, who had never been able to decide whether he was a Royalist or a Republican; and it was this uncertainty that was the cause of his misfortune—for, accomplished and courageous as he was, he had disappointed the hopes of all parties of the State. Wearied to death with his life since he had been exiled from France by the Executive Council, he had built his hopes upon political statecraft, of which he understood nothing, and he had allowed himself to be drawn into this equivocal adventure by men of the most implacable fanaticism like Georges, or of bitter and hesitating ambition like Moreau.

Hardly had he set his foot in France than Pichegru understood that he had been deceived; and with his frank good sense he saw at once that a struggle entered into in such conditions must assuredly fail, and that the old order and the new were irreconcilable. He, perhaps, was one of the first to foresee the mistakes and misfortunes which were to take place in France

 [*All Rights Reserved.*]

during the nineteenth century. Then, sick at heart, and caring little for his life, he had not the courage to tear himself from Paris, and preferred to take his chance in places of concealment in the city he loved rather than trust to English hospitality.

The details of the conspiracy had been carried out by sub-agents with surprising dexterity. Amongst the strange figures which came into notice in the police returns of that period, Spin is worthy of record. Spin was churchwarden of the Church of St Laurent. He was by trade a contractor. He undertook to arrange the hiding-places destined to conceal the accomplices of Georges and of Moreau until the moment arrived for decisive action. He strolled along the streets looking out for apartments to let, choosing those that looked quiet and were in the least-frequented streets, and engaging them in a false name; and then, under the pretext that certain repairs were indispensable, he shut himself in with his tools, and in a few days had arranged a good hiding-place. He then engaged a housekeeper, and told her she would have to provide for a boarder. The boarder, as may be supposed, was one of the conspirators, who lived comfortably, went out as rarely as possible, and on the slightest alarm disappeared into the hiding-place, the mechanism of which had been revealed to him by Spin, without the woman who was the supposed tenant of the apartment having the slightest idea how her lodger appeared and disappeared many times in the day.

Spin was very proud of his proficiency in these singular tactics, and especially of having succeeded in establishing in the house of a friend of his, a tailor named Michelot, in the Rue de Bussy, a hiding-place of the existence of which Michelot, who was obliged by his business to be much away from home, had not the smallest suspicion, and where were established two ruffians armed to the teeth.

When Michelot was away the two fellows stretched themselves out in his apartment, but immediately his step was heard on the stairs they returned to their retreat; and until the day when he and his lodgers were arrested by the police, the worthy Michelot, who was a fervent admirer of Bonaparte, never dreamed that he was giving hospitality to English agents.

Pichegru manifested a great dislike to these enforced retreats. He preferred allowing himself, anyway, the illusion of liberty. It is quite possible to trace almost completely his wanderings about Paris, with the exception of some nights passed at the risk of encounters, of which several were said to have cost him ten or twelve thousand francs. This was a large price, but the walls were covered with placards announcing that those who received malefactors even for twenty-four hours without denouncing them to the police were liable to imprisonment and death; therefore even the most hospitable houses were closed to all unknown persons.

Pichegru entered Paris by the Barrier St Denis in the cabriolet belonging to Georges. He passed the first night in the house of a wine merchant named Denaud, in the angle of the Rue de Bac and the Rue de Varenne. This was a great resort of the Chouans, their rallying-place, from whence they proceeded to the various localities to which they had been assigned.

He then resided for two days in the Rue Carême Prenant, in one of the houses which Spin had arranged. One next hears of him at Chaillot in a comfortable pavilion on the banks of the river, which had been hired to serve as a refuge for a prince, whose arrival was counted on by the Royalists, but who declined to cross the sea.

The pavilion at Chaillot was the headquarters of Georges, who gave up his room for a few nights to the General. It was a charming apartment, well furnished, and having two large windows opening on to a terrace. Pichegru was next lodged at the Hôtel du Cercle, Rue Richelieu. He occupied there a room, of which the upper part of the partition was glazed to give light into a corridor. The door of the room was also glazed, covered only with a light curtain; and as Pichegru was in the habit of reading in his bed late at night, any one passing along the corridor could see him as distinctly as if he were sleeping in the public square. He therefore left the Hôtel du Cercle for the Hôtel du Commerce, where he remained only three days; the ex-General Lajolais, his friend, having hired under a false name an apartment in the Rue Culture Sainte Catherine, where he was able to find a safer refuge. He also stayed for a few nights in some rooms in the Rue du Puits de l'Ermite belonging to a clerk named Verdet, who was employed in the office of the National Debt. He then introduced himself under the name of Prevost to a young milliner named Susanne Gilles, Rue des Noyers. He remained there for forty-eight hours; but Susanne, who knew who he was, became alarmed and turned him out. Meanwhile the patrols of the city police and the gendarmes held all the streets, and the troops of the garrison of Paris, with loaded carbines, were guarding the exterior boulevards. No one was allowed to leave the city at night under any pretext whatever; and as the cemeteries were situated outside the walls of the city, the officials in charge of the barriers had received orders to open all the coffins that passed, despite the lamentations of the mourners. The Parisians, disturbed in their usual habits of life, did not dare to grumble, but they sneered discreetly, convinced that the conspiracy was an invention of the police, and that Pichegru had not set foot in France for the last seven years.

In a house in the Rue Vivienne, nearly facing

the Rue Colbert, there lived at the time a freight commissioner named Treille. He had married two years previously a widow, Madame de Caux, who by her first marriage had a daughter, then sixteen years old.

Pichegru, at the time that he was General-in-Chief of the Army of the North, had been very intimate with the Caux family, and Madame Treille regarded him with great affection. She knew he was in Paris, and it was to her he came, after Mademoiselle Gilles closed her door to him. Treille, having been sounded, agreed to receive the outlaw, and on the 26th of February, at dusk, Pichegru was received by Madame Treille in the house in the Rue Vivienne, where he was installed in a room adjoining her own; and when, at the usual hour, the door of the shop was closed they sat down to supper.

Treille had as his partner and habitual guest an accountant named Leblanc, in whom he placed the most absolute confidence. They had met some years previously at a Masonic lodge, of which they were both influential members. To all appearance Leblanc led a most regular and honourable existence; he had done a little soldiering, but had never meddled in politics. He lived alone in a lodging near the Opera, situated then on the site of the present Louvois Square.

He dined on the evening in question with the Treille family and Pichegru, whose identity was not concealed from him. They sat and talked for a long while, and the night passed quietly; but the next day they agreed that the locality was not a safe one. The flat was composed of a suite of rooms piled up with merchandise, and during the day was open to all comers. The outlaw himself agreed that if he remained there any longer he would compromise his host without gaining any advantage himself. He consulted Leblanc, who with great alacrity placed his lodging at the disposal of the General, and it was arranged that he should move there when it was dark.

The day passed without incident. These people had thrown themselves into this tragedy with the most singular carelessness, never appearing to realise that they were risking their lives, and that the whole of the Republican police were on the track of this man whom they were handing on with the greatest tranquillity.

On the 27th, as he sat at the table with the Treilles, Leblanc thanked Pichegru most warmly for the honour he conferred upon him by accepting his house as a place of refuge, begging him to excuse the lack of comfort which it afforded, but assuring him of its safety as a hiding-place.

As on the previous evening, they conversed quite freely. Leblanc appeared to be pleased, or even amused, at finding himself mixed up in this adventure. It is impossible to say what was passing in the mind of this man. Nothing is known of his antecedents, nor of how he was situated as regards fortune, nor of his character; the papers which would have supplied this information have disappeared from the archives, and amongst the enormous pile of documents which have been preserved with reference to the affair of Georges Cadoudal and his accomplices, the name of Leblanc does not appear.

We are told, however, that at supper that evening his gaiety was succeeded by visible preoccupation; and, rising from table, he informed his friends that he had some urgent business to transact.

He hurried off to the residence of General Murat, who was then Governor of Paris, and asked to see him. He wished to inform him that on that night Pichegru would sleep under his roof, and to demand the sum of one hundred thousand francs as the price of his betrayal of the General. But Murat was absent, or refused to receive him, and Leblanc declined to confide his secret to any one else. He announced, therefore, that he would return later, and hurried back to Treille's house, where the party were still at table. Leblanc resumed his seat, and told his friends that his business had been successfully carried through. He recovered his spirits, and the evening passed pleasantly.

Towards nine o'clock he rose, and the whole party, in the most friendly manner, said they would accompany Pichegru to his new lodgings, the party including Treille and his wife and Mademoiselle de Caux.

The Rue Chabanais was not then, as it is at the present time, open as far as the Rue Rançeau. It began in the Rue des Petits Champs, and turned at right angles into an extremely dark and solitary square, enclosed by immense, high buildings of seven stories, with small windows. It was in one of these buildings, No. 39, that Leblanc lived. Even in summer no sun could penetrate here, and a semi-darkness always existed.

Leblanc ascended the staircase, followed by Pichegru and Treille, who wished to see the General to his room. There was only one bed in the lodging, but Leblanc cut short all discussion by saying that he could be accommodated at the house of a friend. He called his servant and told her that Pichegru was a relation of the Treilles come to Paris on business. He then wished the General good-night, the latter shaking him warmly by the hand; the door was carefully closed, and the key handed to the servant, who was lodged on the floor above, to whom orders were given that every attention should be paid to the gentleman next morning.

Leblanc went downstairs with the Treille family, and they parted in the street. Mademoiselle de Caux, with tears in her eyes, called upon God to bless Leblanc, and implored him to watch over the precious life confided to his care.

The Treilles returned to the Rue Vivienne, and Leblanc turned down the Rue des Petits Champs.

At one o'clock in the morning he left the house of the Governor of Paris, accompanied by an official named Comminges, six gendarmes, and six of the city police, under the command of Lieutenant Noireau and Cavalry-Sergeant Gillet.

On arriving at the Rue Chabanais, Leblanc knocked at the door, which was opened. He ascended the stairs noiselessly, followed by the men. He left the gendarmes on the landing outside his room, and went up to that of his servant, whom he awoke and ordered her to give him the key of his apartment. The terrified girl obeyed, and crept downstairs after her master. Comminges took the key, and listened at the door. No sound was to be heard. He tried the door; it resisted his efforts, having been barricaded with a heavy piece of furniture.

At a sign from him his men hurled themselves against it, and rushed into the room. Pichegru was not asleep. He was undressed, and lying in bed reading. At the first alarm he sprang to reach his pistols; but one of the gendarmes overturned the table on which the light stood.

In the darkness a fierce struggle ensued; the police agents threw themselves upon the unfortunate General, who defended himself valiantly; but finally he was overpowered, gagged, and bound with sheets torn from the bed—and Leblanc had earned his hundred thousand francs.

In the street a curious crowd had assembled. When the gendarmes emerged from the house there was some slight disorder, which was quickly suppressed. The police agents followed, carrying with difficulty the body of a man enveloped in linen, from which protruded two contused and bleeding feet. In this manner Pichegru, deprived of all power of movement, is carried to the Place Vendôme, to the bureau of the Chief Magistrate, and thence to the police station in the Rue des Saints Pères. He is flung, tightly bound, on the floor of Réal's office. The Chief of Police orders the sheets to be withdrawn, and the face of the unfortunate man is exposed, swollen and apoplectic, the eyes closed, and the teeth clenched in passion.

His identity being established, he was carried on a litter, escorted by twenty gendarmes, through the streets of Paris, and deposited in the Temple Prison, where, on the 1st of March 1804, he put an end to his eventful career by suicide.

In 1815, the political weathercock having turned, the memory of Pichegru was honoured as one of France's most sublime heroes, and a statue was erected to his memory at Besançon. This, however, was destroyed in 1830.

THE CAHUSAC MYSTERY.

CHAPTER II.—LADY CAHUSAC BREAKS SILENCE.

WITH night the wind had gone round to the north-east, cold nipped the bud of spring, and darkness rushed over a wintry city. The rising gusts could be heard in the dining-room, where, set in a frame of oak-panelled walls, the table gleamed white and exquisite under a soft moon of electric light.

Lady Cahusac sat almost silent opposite to her stepson. During the meal she asked him a few questions, to which he replied rather formally. He now realised for the first time how formal and restricted had been their intercourse in the past. A good deal of his life had been passed under the same roof, and yet how little he knew of her! He fingered a spray of lily of the valley, and meanwhile marked the change that a year had made in her appearance. She had not yet outlived her reputation of being one of the handsomest women in London, and the moss-green draperies and emeralds she wore enhanced the beauty that remained to her. But she had grown more fragile, painfully fragile, and the look which as a boy had always surprised him was now more pronounced, more settled in her misty eyes—a quick, hunted look, a look singularly at odds with the composure of her manner, though he recognised to-night that her calmness was not composure, but self-repression.

The servants had long before left the room, and the evening was growing late.

Lady Cahusac had moved to an arm-chair by the fire, saying, with her faint smile, 'I will stay with you to-night, Malcolm,' and straightway fell into a reverie; while Malcolm watched the firelight flicker in the decanters before him, and cast about in his mind as to how he should open the matter that engrossed him.

'Mater, you should take more care of yourself,' he said at last, 'or, now that I am here, allow me to take care of you.'

She gave him an absent look, and murmured, 'You are very kind; but I need nothing.'

Time passed slowly, with now and then a desultory word or two, until close upon eleven; then Malcolm rose and rang the bell. When the butler appeared he dismissed him for the night; he wished for no interruption during his conversation with his step-mother. He must not trouble her, yet he felt that by taking advantage of her mood he might learn all there was to learn. He sat down beside her. 'Mater,' he said simply, 'tell me about my father's death.'

She started violently, and began to tremble. 'To-night?' she repeated with agitation.

'Yes, to-night,' he answered very gently. 'Surely the time has come for me to know all that you can tell me.'

'I wonder! I wonder!' she murmured with a sudden piteousness.

'He was my father,' said Malcolm quietly.

'He is nothing to you—a shadow, a name; but to me'—— She paused.

'Trust me,' he said after a moment, and checked himself. Trust! Why?

'I meant to tell you when you came home, perhaps to-night.' Her thin hands were clenched together on her fan. 'You must swear to stand by me, Malcolm! It has worn me out, the knowledge and the long struggle. It has worn me out! You see, I have borne it quite alone!'

Malcolm set his teeth. What, in Heaven's name, was coming? The suspense was growing unendurable. 'Of course I will stand by you.' His voice seemed to carry conviction to her.

'Then you shall hear. You shall know the truth that is killing me.'

Malcolm waited in silence. Her strange emotion had worked him into a tumult of feeling. There must be some meaning in this mood of hers which was so unlike anything he could connect with his past knowledge of her. Then suddenly he became aware that she was pouring out her story.

'We had been married not quite three years when—it happened. That evening we had dined alone, and afterwards went to a ball at the Austrian Embassy. The Prince was there.' Her voice for a moment lost its strained note in the murmur of reminiscence. 'Yes, I remember! I wore the cat's-eyes and diamonds that Malcolm had given me.'

The young man knew that he was not the Malcolm of her thoughts, and kept silence, for he was aware that each impression must follow in its due order, the vital with the trivial, falling one by one into its accustomed place in the mosaic of her memory.

'I was wearing green,' she went on. 'He noticed it; he liked me to wear green. I danced a good deal, and it was nearly two o'clock when he came for me. He—never danced. It was time for us to go; he put me into the carriage. He said he would walk. A dark, windy night, but fine. He shut the door himself, and called to the coachman, "All right!"—the last words I ever heard him say—"All right!"'

The jotted sentences, like the strokes of a brush, reproduced the scene touch for touch in the young man's excited imagination.

'I was in my room, writing notes to Lord Hipsden and some others, waiting till he came—till Malcolm came. I was tired, and fell asleep. It seemed but a few minutes when I woke; the bell downstairs was ringing—ringing. It was very dark, and rain beat and spattered on the windows. They laid him on the bed in his dressing-room. He was dead!'

Young Malcolm sat rigid, waiting.

'They had laid him on his face. The wound was between the shoulders. I saw the knife. All night long the house was lit up like a lantern—like a lantern; and men in heavy boots came and went. There was a crowd outside the railings, for I heard cries to make way. A doctor came in; I had never seen him before. He said—I overheard—"Instantaneous? Oh, quite! Can't have known who struck him!" And then, "Poor lady! poor lady!"' She shook her head slightly as one might over another's misfortune. 'I think they—or he, the doctor—gave me something to make me sleep after they had questioned me. When I woke it was daylight, and I remembered that Malcolm was dead.'

For a long time she brooded, and her tone was lower when she spoke again. 'While I lay there I heard a boy crying the news in the street in a dreadful voice. Somebody went and drove him away. People came, but I would see no one. Then a detective—I was forced to see him. He talked of clues.'

'Who found my father?'

'A bricklayer out of work.'

'Ah! what of him?'

'Oh no! there was no suspicion of him!' Lady Cahusac returned sharply. 'It was not he! a poor creature who had only left his wife and children a little while to try to earn a few pence. Oh no!'

The strange certainty of her manner startled Malcolm.

'How can you—know?' he asked.

'It was not a case of robbery.'

'You do not mean—that he killed himself?' Malcolm scarcely knew what he said. Wild surmises were mounting to his brain.

She made no direct answer to this, passing it over as if the idea were nothing in comparison with the truth.

Malcolm, watching her, dropped his hand heavily on his knee. 'Do you know who murdered him?' he asked.

She flashed an anguished look upon him. 'It was not a murder.'

Malcolm leant back in his chair. Here was the explanation—there could be only one—his stepmother was mad, possessed of some outrageous idea!

'The days passed. They brought his coffin,' she resumed after a moment. 'It was night; they stepped softly, but I knew! And then I saw him for the last time. The house was dark and empty. He was gone. And through the heaviness some one carried me a letter. I read it. "Will you see me for your husband's sake?"—that was all.' Her strained whisper grated on his nerves.

'Go on,' he said hoarsely.

'From the man who wrote that letter I learned the truth. He told me that your father, my husband, had used his official position to sell national secrets to foreign Governments.'

'You believed that?' Unconsciously Malcolm gripped the arms of his chair.

'Do you think I believed it readily? It was to this man himself that the secrets were sold!' She threw out one hand with a gesture curiously unlike herself, and Malcolm divined that with such a gesture the disclosure had first been made to her. She was reacting a moment scarred upon her memory.

'He told you a lie—an impossible lie! Who was that man? Leave me to deal with him!'

She surveyed him, crouching in her chair as if with terror. 'What could you do? Would you let the world know? He had proofs, letters'——

'How did he account for my father's murder?' said Malcolm sternly.

Lady Cahusac put both her hands to her head. 'Ah, there was the proof—the strongest proof of all! Suspicion had been aroused, and the people in power—the Secret Service, I don't know who, but those who could not touch him in any other way—had arranged for his assassination!'

Malcolm's face warned her. She raised her hand. 'Don't speak! Hear the end. The question at the moment was to save your father's reputation. No matter how I did it! That man was the only human being who *knew*. Do you understand? He threatened that there would be an exposure, a scandal, my husband's name dragged down. He showed me how easy it would be if I—if only I—would help; that it could all be avoided. I knew where the papers were kept that he wanted. He swore they had been promised to him. What could I do?'

Malcolm thrust his elbow back upon the table behind him, wrecking glasses and flowers. 'What *did* you do?' he said.

'I gave them!' she cried with a nervous defiance, stringing her figure upright. 'I had to—for your father's sake.'

'Have you anything more to say? Let me hear the end of it—now!'

'I have seen the man from time to time. He forced me to tell him certain things I heard, or could find out, to buy his silence. Oh, you will never understand!'

Malcolm was on his feet. 'Who was he?'

'I cannot tell you. I swore to him.'

Malcolm did not seem to heed her reply. 'Tell me his name.'

'I will not break my oath.'

'His name!'

'You will never hear it from me. But listen, Malcolm—be patient. There is something you must hear, something far more important. At the beginning he demanded from me two letters which he had written to your father. I could not find them. I believed your father had destroyed them. But a month ago I came upon them by the merest chance. They were fixed flat against the back of the secret drawer of the cabinet in the study, caught in the woodwork. No wonder he wanted them back! They—they showed me the truth, how cruelly I had been deceived! That same day I cabled for you. It is you who must deal with those letters. Wait! He heard that I had sent for you, and he suspected at once that I had found the letters.'

'Where are they?'

'I have them still; I have kept them in spite of his threats.'

'Where are they?' Malcolm repeated harshly.

'In the same drawer just where I found them.' She fumbled at her bosom, and drew out a strange, crooked key. 'You can take them. Then, moved by a renewal of her old terrors, she would have clutched at the key again. 'Stop! stop! What will you do with them? Malcolm, Malcolm!'

But he was gone, taking the key, and had crossed the hall into the library. He had spoken no word of reproach; but his face, the eyes with which he had looked at her when she made her confession! Yet what she had done was done for the sake of the other Malcolm whom she had loved.

What was that noise? Transfixed with apprehension and weakness, she listened. Ah, what was it? A cry, a groan? Drawing herself forward foot by foot, she gained the library door. A horrible sense of helplessness oppressed her. The whole night seemed to be listening, and she felt afraid.

For a second she stood, supporting herself by the door-posts, and looked in. The electric light above the cabinet shone brilliantly. The next instant all was darkness; but in that instant, as by a flash of lightning, she had seen!

Malcolm lay on the floor, his fair hair already dabbled in blood, and over him stood a man, his body thrown forward, his hand in the drawer which hung open. A loose coat shrouded his figure, and though he turned his head at the rustle of her gown she could not see his face under the wide shadow of his hat.

With the darkness her scream came, breaking the stillness. It was a name: 'De Sarsan!'

The intruder fled, striking at her murderously with the weapon in his hand as he passed her; but the blow missed, for she lay her length upon the floor, screaming, screaming.

(To be continued.)

PLANTATION SONGS.

A PARTIALITY for music has always been a characteristic of the negro race. In their native Africa the instruments used are of the most primitive kind, the drum generally playing a prominent part. To the untutored European such music seems more remarkable for noise than melody, though under the influence of 'tom-tom' performances the negroes in the West Indies and elsewhere have been known to work themselves up to a pitch of regular frenzy.

Negro songs have always been popular among us, and deservedly so. On what does their attraction depend? As poetical products they are generally seriously defective. The negro has been aptly described as a person with the intellect of a child and the strength and passions of a full-grown man, and these characteristics are borne out by his poetry. The language of the plantation-song is often a disjointed jumble, scarcely superior to a nursery rhyme, yet it contains a pathos which strikes the deepest chords of the human heart. This is their great merit, and it is more than sufficient to counterbalance deficiencies of rhyme, metre, grammar, and composition, and to endear them not only to the coloured race but to English-speakers of all races all the world over. The phenomenally long runs made by Christy Minstrel performances in London and elsewhere bear witness to this fact.

Plantation-songs have been the delight of high and low, educated and uneducated, of all ages and of both sexes. It is doubtful if there is any kind of theatrical performance that is more universally popular; nor can it be denied that, whether they strike the sentimental chord or the lighter vein of humour, they are innocent in their nature and elevating in their tendency. Would that the same could be said of all music-hall songs! Eminent statesmen, like the late W. E. Gladstone, have been seen listening with rapt attention to these old-fashioned ballads; while the novelist Thackeray records his impressions as follows: 'I heard a humorous balladist not long since, a minstrel who performed a negro ballad that, I confess, moistened these spectacles in a most unexpected manner. I have gazed at thousands of tragedy-queens dying on the stage and expiring in appropriate blank verse, and I never wanted to wipe them; they have looked up, be it said, at many scores of clergymen without being dimmed; and, behold! a vagabond with a corked face and a banjo sings a little song, and strikes a wild note which sets the heart thrilling with happy pity.'

Mention has been made of the fondness of the negroes for music; in some cases the natural intuition or instinct is very remarkable. No better instance of this fact could be cited than the case of Black Tom, the musical prodigy. This boy, born about 1850, as a slave, in the Southern States, developed a most remarkable talent for music, although he was both blind and half-witted. Late one night, after Tom's master had retired, he heard the sound of music proceeding from the drawing-room. Some one was playing the piano with delicate touch and no ordinary skill. Dressing himself hastily, he stole downstairs, and opening the door of the drawing-room, peeped in. The sight which met his eyes almost took his breath away. The talented musician proved to be the blind black boy Tom. He played not only some of the simple songs he had already heard performed on the piano, but difficult exercises which he had heard the daughters of the house perform, exhibiting all the while an ecstasy of delight. The blind boy was playing the piano for the first time in his life! The fame of the new prodigy spread far and wide. From that time Tom was allowed free access to the piano, to his great delight, and was a source of wonder to the many visitors who flocked to hear him. Old airs which people had forgotten, and which Tom could not have heard more than once, were played with the greatest accuracy. His master was induced to make a public exhibition of the boy's talent. He performed in various cities of the Southern States (the slave-laws prevented him from touring in the North), and on the outbreak of the great Civil War he was taken to England, where he played to crowded audiences in St James's Hall.

In order thoroughly to appreciate these touching negro songs it is necessary to understand something of the condition of the people who cultivated them, principally the negroes of the Southern States. There are some who picture the Southern negro in the old slavery days as a poor, down-trodden wretch, working under the lash and treated with the greatest cruelty. There are others who will tell you that the negro in the days of slavery was as happy as the day was long, and quite contented with his lot. The real truth must be sought for between these two extremes; though, if one were to judge from the general tenor of the old plantation-songs, the latter condition is much nearer the truth than the former. The writer of these lines has lived in the Southern States, Brazil, and the West Indies, in all of which countries slavery existed within the memory of the present generation. He has conversed with many old slaves, and his opinion is that cases of cruelty to slaves were extremely rare.

The songs of the Spaniard deal almost exclusively with the subject of love; his studied compositions are marked by an excessive hyperbole of imagery which detracts from their value

as genuine outbursts of sentiment. How different is the case of these simple negro melodies! Here the sentiment of love, though not absent, takes a secondary place; his favourite songs describe the ordinary routine of plantation-life, corn-hoeing and cotton-picking, enlivened in the evenings by dance and banjo-playing. On looking over a collection of negro melodies one cannot help being struck by the frequent use of the epithet 'old:' 'The Old Folks at Home,' 'Take me Back to Old Tennessee,' 'The Old Kentucky Home,' 'On de Banks ob dat Ribber de Old Santee.' It is the same sentiment that the Scotsman expresses in the phrase 'Auld lang-syne,' quite untranslatable into classical English. In fact, 'old' is the most affectionate word in the negro vocabulary; as a phrenologist would say, he has the organ of veneration highly developed, and this forms the keynote of many of his finest melodies.

That the negroes as a whole were extremely attached to their masters and to the plantations on which they had been reared will not be denied by those qualified to express an opinion. This sentiment abounds in the old plantation-songs, as in the following:

Now massa him dead, him gone to rest;
Ob all de massas he war best?
I nebber forget de day him die.

Or again:

When de autumn leaves war falling,
When de day war cold,
'Twas hard to hear old massa calling
Cayse he was so weak and old.

Or take the converse—the affection of the master for the slave:

When old Ned die massa take it mighty bad,
De tears run down him like de rain;
Old missus turn pale, and she gets berry sad,
Cayse she nebber see old Ned again.

The above lines are commemorative of the death of a negro slave. Who will say after this that the boasted bond of sympathy which united master and servant in the old slavery days was a mere fiction?

The following lines are samples of hundreds of others which express the hold which memories of the old plantation had on the quondam slaves:

Way down upon de Swanee ribber,
Far, far away,
Dere's wha my heart is turning ebber;
Dere's wha de old folks stay.
All up and down de whole creation
Sadly I roam;
Still longing for de old plantation,
And for de old folks at home.

Another:

The sun shines bright on de old Kentucky home;
'Tis summer, de darkies are gay;
De young folks roll on de little cabin floor;
All merry, all happy, and bright.

Sometimes the only thing that seems to recommend itself in these negro melodies is a merry, catchy jingle, as in the following ('Camptown Races'):

Gwine to run all night,
Gwine to run all day;
I'll bet my money on de bobtail nag;
Somebody bet on de bay.

Perhaps the best of these songs were those written by Stephen C. Foster, who (though not a negro himself) may be described as the Burns of negro minstrelsy. He wrote more than a hundred songs, many of which are deservedly popular. Several of the verses quoted above are from his pen. There is nothing affected about these songs; they make no attempt at erudition or literary talent; they are simply the natural, spontaneous outpourings of the heart, and in this fact lies their great value. In this respect they are well worthy of comparison with the songs of Burns. Foster not only wrote the songs, but he himself composed the music to which they were set. The simple, unaffected language of songs like the following is one of their greatest merits:

Dere was an old nigger, dey called him Uncle Ned,
He's dead long ago, long ago;
He had no wool on de top ob his head,
De place wha de wool ought to grow.
His fingers were long like de cane in de brake,
He had no eyes for to see,
He had no teeth for to eat de corn cake,
So he had to let de corn cake be.

The corn cake, or 'Johnny' cake, made of maize, formed part of the plantation fare. The word is said to be a corruption of 'journey' cake; but in the writer's opinion the more probable explanation is to be found in the nickname ('Johnnies') given by the Northerners, or Federals, to the Southerners, or Confederates, during the great Civil War. While the commissariat of the Northern armies was always liberally supplied, the rations supplied to the Southern troops were poor in quantity and quality, and maize (corn is always so called in the United States) often formed the mainstay; hence the term 'Johnny cake;' hence also the humorous abbreviation 'Fed' and 'Corn-fed' applied to the Federals and Confederates respectively.

When the war was at its height the artist-correspondent of the *Illustrated London News* describes how he saw the negro slaves in the South working hard on the fortifications, and contentedly helping their masters in the attempt to rivet the chains of slavery more firmly about their necks, singing the while some ditty such as the following:

Oh, I don't like de lowland girl;
Do you know de reason why?
Cayse she comb her hair wid de herring-bone,
Which am not pleasing to my eye.
But I do love de mountain girl;
Do you know de reason why?
Cayse she comb her hair wid de tortoise-shell,
And her movements am so spry.

THE BANDIT AND THE LADY.

CHAPTER II.

WHEN Tredare returned to the Osteria dei Fiori the dusk was creeping over the mountain-tops and along the precipitous ravine; when he descended to dinner stars were shining in a sky of the deepest azure. He ate his meal at the same table on the *loggia* at which he and Beppo Cavalanci had drunk the exquisite wine of the Val di Ferentola. But there was no sign of his bandit landlord; a little serving-maid waited upon him.

Tredare had finished his dinner, and was making notes upon the Madonna in the church, when the landlord's face suddenly appeared in the circle of light cast by the single candle in its glass globe.

'Then the signore is not afraid of me?' he asked, half-seriously, half-banteringly. 'He does not believe that I shall rob and murder him?'

Tredare laughed. 'No,' he answered; 'I am not afraid of you.'

'Yet the priest told you I was a bandit?'

Tredare nodded.

'That formerly a price was set upon my head?'

Again Tredare nodded.

'And that for some mysterious reason the *velo d'oblio* had been drawn over the past, that I had been pardoned by the Government?'

'Yes,' said Tredare; 'all this he told me. But how do you know?'

'He tells every stranger the same story. Did the signore believe it?'

'Not a word of it. I saw he had a spite against you because you do not give money to the Church.'

'But, signore, it is true! Are you afraid now?'

Tredare drew a revolver from his hip-pocket and laid it on the table. 'No,' he said calmly; 'I am not afraid.'

'You will have no need of that in my house,' said the landlord reproachfully, pointing to the revolver. 'The past is past. But I knew the signore did not believe the priest's story, else he would not have returned to the Osteria dei Fiori; he would have sent for his luggage and have gone to one of the dirt-holes in the town.' He drew himself up proudly. 'I could not let the signore stay under my roof knowing he believed a story that is true to be a lie of the priest's. It would not be honourable.'

The statement expressed a point of view so entirely foreign to the accepted estimate of a bandit's character that Tredare with difficulty repressed a smile.

'If you were a proscribed man, as the priest says, why did the Government pardon you?' asked Tredare.

'I did the State a service,' Cavalanci replied with quiet dignity. 'The *podestà* and the others know why I was pardoned, but they were bidden by the Government to hold their peace. The priest is a magpie, and would have told all the world that but for me the Princess della Gravina would still be a prisoner in a desolate castle in Apulia, and that the heads of the Camorra in Naples would still be enjoying her vast fortune. There are times when the Camorra is more powerful than the Government, and it is not well that this should be known amongst the ignorant.'

Tredare leant forward eagerly. He had heard curious stories about the power of the Camorra by reason of its ramifications through every section, high and low, of the population of Naples, and he knew that the man who defied this secret organisation, with its powers of life and death, must be of high and resolute courage. 'You've helped the Government against the Camorra?' he asked, a note of admiration in his voice. 'How?'

The landlord was obviously pleased by Tredare's interest. 'It is a long story,' he began, with the air of one who wishes to be pressed to continue.

'But not too long for me to hear,' interrupted Tredare; 'and whilst you tell it we will drink another bottle of the exquisite Val di Ferentola.'

The landlord fetched the wine, and, seating himself at the table, plunged straightway into his story with all the southern Italian's delight in monologue. He made no attempt to excuse or explain his former calling, but began:

'Three years ago I was hard pressed—it was after the affair of the diligence. A ring of *carabinieri* and soldiers was set round the whole district. Old friends, who had hidden and fed me many times before, did not dare to give me either shelter or food, for they were watched. My safest hiding-places had been discovered, and gradually day by day the ring of *carabinieri* and soldiers drew closer and closer, until at last a ravine, into which they had driven me as the hunters drive a wolf to its lair, was entirely surrounded. There was no hope of escape! But Beppo Cavalanci was always a match for as many *carabinieri* as they liked to send against him. Through the bottom of the ravine ran a deep and swift river. When darkness came I crept from the cave in which I was hiding, and dropping into the black water below, was borne away like a leaf. The current was so strong that a gentle movement of the legs alone served to keep me afloat. At the end of the ravine was a bridge, and as the water whirled me towards it I heard voices and saw the glint of

steel. I drew a deep breath, and sank beneath the water. A minute later I had broken through the ring that had hemmed me in, passing underneath the feet of the men whose rifles were ready loaded to shoot me at sight. But I had lost everything, and a bandit without arms'—he smiled grimly—'well, he is no longer a bandit.

'I hid by day and walked by night, not knowing where I was going, until, starving and shivering with fever, I found myself in the neighbourhood of Naples. There was no fear of detection there, but I had no papers. No one would employ a stranger without papers. I was lean with hunger. One day I stole a loaf of bread from a basket a woman was carrying on her back. Her husband, who was walking in front, chanced to turn, and saw me take the loaf. The man and the woman fell upon me like furies, and beat me until I was nearly senseless; they beat me, Beppo Cavalanci, and I had no strength left to resist. I knelt in the dust and begged for the bread. My misery softened the woman's heart; and breaking the loaf in two, she thrust one half into my hand, saying, "I would give you all, but the children are hungry at home. My man and I can go without for one day."

'The bread comforted me, but I said to myself, "This is a dog's life; better a lifetime of prison—there at least one has a roof over one and bread to eat." The next day I gave myself up to the police at Naples. But—will the signore believe it?—they declared I was an impostor! "No man who is really a criminal ever gives himself up to the police," said the sergeant. "Then take me to the head of the police," I said. "I will prove to him that I am Beppo Cavalanci, the scourge of Calabria."

'The head of the police is a wise man. He heard me without a word. When I had ended he said, "On the left arm of Beppo Cavalanci, above the elbow, is tattooed a red heart pierced by a yellow dagger."

'"*Ecco, Eccellenza,*" said I, pulling back the ragged sleeve of my shirt, "there it is!"

'"And over the left breast," the head of the police went on, just as if I had not spoken, "is tattooed an eagle likewise in red and yellow."

'For answer, I threw open my shirt and showed him the red-and-yellow eagle. In half-an-hour I was locked in a dirty cell, lighted by a small window high up in the wall, and with only a wooden bed to lie and sit upon. I regretted what I had done, until I remembered that I had stolen the bread of the poor woman's children.

'Two days, three days passed, and still I remained in the dirty cell; but I was not hungry. On the fourth day I was taken to the head of the police.

'"Tell me," he said—he had a voice like a razor—"tell me how you broke through the cordon I placed around you. It was I who directed that the *carabinieri* and the soldiers should close in upon you and so drive you to earth. We had you tight in a ravine. I knew the exact spot in which you were hiding; but the darkness prevented our surprising you—lights would have given you the alarm. All night the ravine was surrounded by a wall of *carabinieri* and soldiers. How in the name of all that is mysterious did you escape me?"

'"Did the Eccellenza notice a bridge at the western end of the ravine?" I asked.

'"It was there that I myself kept watch with the soldiers," he replied. "It was the weakest spot in the cordon."

'"Then I had the honour to pass beneath the Eccellenza's feet," I said.

'"Under my feet! But how?"

'"In the river, Eccellenza, which flows under the bridge."

'The head of the police stared at me, his mouth wide open like a gaping chicken. "You went under the bridge in that raging torrent! *Sapristi!*" Then he leant back in his big chair and laughed so heartily that I was forced to laugh with him. But his laughter was short, and suddenly he became the stern and rasping head of the police. "So you have given yourself up?"

'I bowed.

'"Yet you know there is but one punishment for crimes such as yours?"

'"I know that I must pass many years in prison," I answered; "but that is better than starving in the streets."

'His next words turned my blood to ice. "You know you must pass many years in prison!" His voice was like a sword-cut through the air. "Many years in prison, my friend! A lifetime of prison, the *ergastolo*,* is the sentence that will be pronounced upon you!"

'He called to the warders who were waiting without, and I was taken back to my cell.

'Horror and despair fell upon me; they clutched and held me, two torturing fiends, that made each moment an agony. *Ergastolo! Ergastolo!* The words burned and pulsed before my eyes. I saw, as clearly and distinctly as if I were already condemned, the small stone cell with its window of ground-glass which filters all the sunshine into twilight; the hard bench on which I must sleep for all the rest of my life; the turntable in the wall, which would revolve three times each day, bringing me food to keep me alive in my living tomb. I saw the door of the cell close upon me! Oh Maria! Maria!'—Cavalanci half-rose from his chair, his hands tightly clasped—'I heard the bolts shoot

* Capital punishment does not exist in Italy. Criminals who in other countries would suffer the death penalty are condemned to solitary imprisonment for the rest of their lives. This is known as the *ergastolo*. After he enters his cell, the prisoner never sees or speaks to a human being, not even to the warders. His food comes to him on a turntable in the wall. He remains absolutely alone, without books or any occupation, until he dies.

into their sockets and the key grind in the lock, and I knew inside my bones that all I saw and heard with the eyes and ears of my brain would come true—that in a short while they would be realities. I had given myself up! Sweet saints and martyrs! the shooting of bolts and the grinding of a key in the lock would be my end; for there, in that stone cell, I must remain, hour after hour, day after day, year after year, seeing no human being, hearing no human voice, with nothing, nothing except the thoughts of the past, and the turntable bringing food three times in the day that was a century! The *ergastolo* is burial alive—one is severed for ever from all mankind; and one knows that at intervals, all day and all night, warders spy through secret peep-holes to see if you are gone mad—madness is always the end. I remembered all the tales I had heard from a man who had served a term of imprisonment on one of the islands where there were many poor wretches in *ergastolo*. The warders told him of the agonies these living corpses endure. I had listened as one listens to a gruesome tale, and, lo! all these agonies were to be endured by me, Beppo Cavalanci! The head of the police had said *ergastolo*, and because the head of the police had said it I knew there could be no escape from such a fate.

'I will say nothing of that night or of the following day. Signore, in those hours I looked into the mouth of hell.

'In the evening I was taken before the head of the police. At a sign, the warders left the room, and we were alone.

'The Eccellenza looked at me curiously. "Is there a looking-glass in your cell, Beppo Cavalanci?" he asked.

'"The noble Government has omitted to place one there," I replied.

'He came to me, twisted me sharply round, and pointing to a great mirror hanging on the wall, said, "Look! Who has been powdering your head with flour?"

'I looked in the mirror. I saw that my hair—which the day before had been as black and shining as a raven's wing—was strewn and streaked with white, my face was gray, and my eyes were large with fear.

'"What has happened?" the Eccellenza asked. "You are afraid?"

'I thought he was mocking me.

'"I am not afraid of death, but the thought of the *ergastolo* freezes my heart."

'"Are you a Camorrist, Beppo Cavalanci?"

'I shook my head.

'"Would you join the Camorra to escape the *ergastolo*—perhaps to gain your freedom?"

'"Of a surety, Eccellenza," I answered. "I would join twenty Camorras to escape those years of torture."

'"Even if you risked death?"

'"Death would be preferable to the *ergastolo*."

'"Beppo Cavalanci, you are a brigand; you have killed men. You have broken the laws of the State. But you are brave; you have a skilful cunning. At this moment the State has need of bravery and cunning such as yours. Would you do the State a service at the risk of your life?"

'"Most assuredly," I replied, hope sending a hot tingling through all my veins.

'"Listen," said the head of the police—"listen before you decide! Five years ago the Princess della Gravina, one of the most beautiful women in Naples, the wife of the head of the oldest family in our aristocracy, and herself a daughter of a most distinguished and noble house, suddenly disappeared. The police heard reports of the gossip that arose because of the Princess's unexplained absence from Naples. Nothing escapes the police." Then he added with a grim smile, "Except rivers at the bottom of ravines"——

'"And Beppo Cavalanci," I interrupted.

'He laughed. "Yes; rivers and Beppo Cavalanci. But in the end the rivers run into the sea, and Beppo Cavalanci has come to the police."

'"Cold comfort for both," I said; and we laughed. *Ma che!* the Eccellenza had a heart, even if his tongue was like a razor.

'The next moment he turned like a weather-cock in a high wind. "*Basta! basta!* this is no time for laughter," he cried, beating both hands upon the table. "A woman's liberty and your life depend upon this moment. As I say, reports reached us, and we made inquiries as to the Princess's disappearance. There was great mystery, and I myself waited upon the Prince della Gravina. His explanation was both simple and tragical. His beautiful wife had suddenly lost her reason, developing a homicidal mania that made it impossible for her to remain in her home. A family council was held, doctors were called in, and upon their advice the unhappy Princess was taken to a castle in Apulia. The Prince showed me the medical certificate and told me the sad story, with such evidences of deep sorrow that I left the *palazzo* with a sincere sympathy for the unfortunate husband, and convinced that the rumours as to the cause of the Princess's disappearance were baseless. Further inquiries amongst the members of the family who had been present at the family council, and of the doctors, confirmed my opinion—that the Princess was mad, and that the whispers against the Prince were cruel calumnies. Remember, this was five years ago. Three months ago a woman in rags, half-starved, and with bleeding feet, stood where you are standing now"——

'"The Princess?" I said.

'"No; the Princess's maid. She had been taken with her mistress to the castle in Apulia, and after five years' imprisonment had succeeded in escaping. She had no money, and had walked all the way to Naples."

'"Imprisonment!" I said. "But why should the maid be imprisoned because her mistress was mad?"

'"Ah, Beppo Cavalanci, I see you have a quick brain," the head of the police replied. "That is the point. The maid was imprisoned because the mistress was *not* mad. The mistress was imprisoned also."

'"*Per Bacco!*" I cried; "but why?"

'"The Camorra had so willed it," was the answer.

'"But what had the poor lady done to offend the Camorra?" I asked.

'"The lady had not offended the Camorra. She was rich; the husband was extravagant. Although she was beautiful, the Princess was wise. She would not allow the Prince to squander her fortune. Now, Beppo Cavalanci, listen! The Prince della Gravina is one of the heads of the Camorra in Naples, and so well has the secret been kept that he was never even suspected by the police. His two brothers and his uncle, who formed the family council, are Camorrists; the two doctors who signed the certificate of the Princess's madness are Camorrists. What is the answer to that?"

'"When the head commands, the members cannot refuse to obey."

'"Bravo! That is the answer. The Prince commanded, the others obeyed; and as the reward of this obedience they have received large sums of money—the poor Princess's money. Such was the maid's story. Every word of it is true."

'"And the Princess della Gravina?" I asked.

'"She is still a prisoner in the castle in Apulia, and is likely to remain there."

'"But the police"—— I began.

'The head of the police waved his hand. "The della Gravina family are so highly placed that to disclose their position in the Camorra to the public would cause not only a grave scandal, but would create trouble with the Camorra itself. The Government will not sanction the prosecution of the Prince; but at the same time"—he looked at me steadily—"the Government are anxious for the release of the Princess, so anxious that they would reward her liberator most handsomely." He turned his head, and in a lower voice added, "If a criminal effected the Princess's escape his reward would not only be money, but a sponge would be swept over his crimes. Only a Camorrist can set her free. The castle is shut in by high walls on the side of a mountain; there is only one gate, which is never opened save to those who give a password, and no man, unless he is a member of the Camorra, can find out what that password is. You grasp my meaning?"

'"One moment, Eccellenza!" I muttered. My thoughts were going so fast that I could almost hear them clicking in my head. This, then, was the alternative to the *ergastolo*. I was to join the Camorra, learn the password, and rescue the Princess. If I succeeded, liberty, money, and the *velo d'oblio* would be my reward. If I failed, it would mean death, but a speedy death; and whether I failed or succeeded, I should escape the horrors of the *ergastolo*. "Eccellenza," I cried, "I accept! I will join the Camorra; I will rescue the Princess."'

(To be continued.)

ON A SACRED MOUNTAIN OF CENTRAL CHINA.

By JOHN WYATT.

NAN YO SHAN, six thousand feet high, is one of the five sacred mountains of China. Situated in the south-eastern part of the province of Hunan, it is one hundred and thirty miles up the river from Changsha, the capital, and then inland westward twenty miles. Its sanctity dates from very early times; for if the conclusion arrived at by authorities—that the ancient inscribed stone recording the engineering feats of the Great Yü (2205 B.C.) in successfully coping with a terrible flood of the Hoang-ho was erected upon it because of its sacredness—be correct, then its sanctity reaches back to before the beginnings of Chinese history. At and near the top are some small caves which tradition and probability tell us were in ancient times the abodes of ascetics. On what is practically the summit are the monastery buildings, and a short distance away, perched upon the highest rock, is a small temple. When these buildings were erected is uncertain, for the time-resisting blocks of granite of which they are built give no intimation. The great age of the massive structure is undoubted; and, considering the extreme antiquity of the sanctity of the mountain, in all probability it was selected as a site upon which to plant a monastic community not very many years after the introduction of Buddhism into China—70 A.D.

Such was the interesting goal of our pilgrimage, and the fact that this isolated monastery has rarely been visited by Europeans added a zest to the trip. Our party consisted of the writer and his two sons, the elder of whom was the only one of us who spoke Chinese. Our first move was to apply to the *taotai* of Changsha for permission to visit Nan Yo Shan. This granted, we then visited the commandant of the military at our own town, and asked for and obtained two soldiers, not as a protection against violence, but as a restraining influence should the curiosity of the country people become too obtrusive.

Having selected and hired a junk, we at once began slowly to ascend the river. Our goal in the junk was the city of Heng Shan, seventy miles away, which we reached at 4 P.M. on the third day.

On arrival at Heng Shan we sent our cards and the permit by one of the soldiers to the magistrate, and presently an official came on board, accompanied by a soldier, into whose charge we then passed. Having made arrangements for a chair for myself and for coolies as baggage-carriers, we started next morning. Of all the woebegone, dilapidated places one can imagine, Heng Shan seemed the most miserable. It is estimated by the missionary living at Heng Shan that as many as thirty thousand pilgrims per day visit the mountain in the height of the season, of which number at least ten thousand pass through Heng Shan. Such an accession in numbers would transform the streets into crowded and busy thoroughfares. The pilgrim season begins in June and lasts four months.

The aspect of the country here was very similar to the other parts of Hunan—the same paddy-fields, the same narrow roads, and the same farmhouses embowered in shady compounds. The staple products, as usual, were rice and children. Boys and girls of seven or eight years tended flocks of ducks numbering many hundreds, guiding them, while feeding in the paddy-fields, by means of a slim bamboo twenty feet long; and children herding goats on the gently sloping hillside, or raking in twigs and coarse grass for fuel, were frequently seen. Journeying along roads five feet wide and raised about two feet above the surrounding mud and water of the paddy-fields has its drawbacks. Several times we met a man wheeling a barrow upon which lay a large pig securely bound; and as this practically occupied the whole width of the road, we stopped the barrow and my bearers gingerly engineered their way round or over the pig's head. I noticed here, for the first time, a singular custom. For warmth some of the women had fastened under their dress, sometimes before and sometimes behind, a small basket enclosing an earthenware cylinder in which had been placed some burning charcoal.

Our progress through the country caused a little sensation among the inmates of houses as we passed; but the climax came when we stopped to rest in a fair-sized village. Under the covered way in front of the tea-house were benches and stools. My white beard was the principal item of interest at the tea-houses. It was really amusing to study the faces of the men grouped round me, and to notice the soft expression that came into their eyes as they gazed intently upon my beard; one man, bolder or more devout than the others, gently touched it, at the same time speaking. 'It's all right, father,' said my son, who was near; 'he is almost worshipping your beard. He calls it silver threads.'

About noon we arrived at Nan Yo, an ecclesiastical town at the foot of the mountain. This place had the same woebegone and deserted appearance as Heng Shan. We stopped at a rather large building, a so-called hotel, intending to take up our quarters there; but the official was strenuous in his argument that we should go to one of the temples. We entered the Taoist temple, where we had some *tiffin* in comparative privacy, as only seven or eight priests stood around looking on.

The temple grounds cover an area of about six or seven acres, and are surrounded by a wall fourteen feet high. They are subdivided into three enclosures, in the principal of which stands the main temple, surrounded by avenues of trees and a granite pavement, on either side of which, instead of a grass sward, the space is given over to half-bricks, ash-heaps, potsherds, broken glass, and other indications of untidiness and neglect. Sundry pigs, dogs, and fowls roamed at will.

Round the temple enclosure were pillared cloisters in a similar state of dirt and disorder, even to the ashes and bits of charred sticks remaining from the fires made against the cloister wall by the pilgrims of the past season. The temple itself stands upon a raised foundation, and is surrounded by a colonnade. On the face of the raised foundation and on the walls of the temple are carvings of white marble in relief. Access to the temple is obtained by a double flight of granite steps, and crossing the colonnade, we enter through a small door. The interior is gloomy and cavern-like, and until the eye gets accustomed to the darkness little is seen. Opposite the main entrance is the shrine, in which is seated a massive gilded figure supported on either side by others standing. In front of the shrine is the altar, upon which is a bowl of burning incense and a lighted lamp of antique make. In front of the altar is a table upon which are carved bamboo vases and curiously carved staves, part of the stock-in-trade of the priest-soothsayers. Ranged round the walls at varying distances are other gilded figures, some gigantic and of ferocious appearance. Of the other three temples we visited but one, that containing an ancient monument. This was a representation in stone of a gigantic tortoise. On its back stood a stone pillar tapering a little towards the top. We could learn nothing about its history or meaning.

Leaving the Taoist temple grounds, we passed through a good portion of the town to the Buddhist temple. This temple had the same gloomy, cavernous interior as the Taoist temple, with a similar arrangement of gilded figures; but the seated Buddha was much larger and more artistic in design and finish than the figure in the Taoist shrine. The calm, majestic expression on its face called forth our highest admiration. I asked our priest-guide where were the praying-wheels, and was informed that the Chinese

Buddhists never used them. We were led out into the grounds behind, and were shown where the priests were cremated and the grave where the ashes were deposited. The crematorium was a small, square building whose bricked-up doorway was still warm from the last burning. The grave was in the usual Chinese style, horseshoe shape, with granite monoliths round the curve; a square stone covered the aperture which led to the vault below.

Next morning our caravan started for the ascent. For the first three miles the gradients were fairly easy, though at the steeper places the roadway, paved with granite slabs, was frequently converted into steps. The remaining distance, seven miles, was nearly all steps; rarely did we experience a bevel or slope, and then only for a short distance. Twice the way led along a real 'razor-back.' On both sides the mountain sloped precipitously, where with one stumble on the part of the bearers all interest in life would have ended. At other times the steps were so steep that there seemed a danger of the bearers falling backward. At such places I preferred to get out of my chair and walk. At various intervals were small villages whose few houses clustered about a tea-house, with benches and stools under the covered way as usual. Here we would stay a while, rest the coolies, and enjoy a pipe while being inspected by the natives.

The scenery during the earlier part of the ascent was very enjoyable. The gullies of the foothills had their rushing streams and foaming cascades, while their sides were often terraced by miniature paddy-fields. We looked down upon the city of Nan Yo, with its yellow-roofed temples, and upon the country round, with its small lakes, streams, villages, and farmhouse compounds. But soon this pleasant view was gone, for at an elevation of about two thousand feet we entered the clouds, and the earth was lost to us until our return. Emerging from this cloud-stratum, we were disappointed to find the sunshine still excluded from us by another cloud-mass at a great height, as we had not entered it on reaching the monastery. The position of the last village was peculiar. It was built on both sides of the steep roadway.

Later on we came to a small Buddhist temple, where we stayed a short time for the double purpose of resting the coolies and inspecting the interior. The altar shrine contained the usual Buddha, who was supported on either side by figures, one seated on an elephant and the other on a tiger, each with a foot on the neck of a coolie who seemed labouring under the burden. Other figures there were, one a god of agriculture, if we could judge by the offering of fruit at his feet. This figure, with uplifted hand, held up the first and second fingers, as our Christian bishops do when giving the benediction. This sign is found in the ancient Egyptian carvings. The Goddess of Mercy was here. She holds in Chinese Buddhism a position analogous to that of the Virgin Mary. She is always represented leading a little child. The usual burning incense and joss-sticks, as well as drums, bells quaintly carved, and gongs, were in evidence.

Continuing the ascent, we approached a small building, the door of which gradually filled with forms and the faces of others peering over them. They were very old Buddhist monks and nuns, and the hut was their last home during life.

Up, still up, yet no signs of the monastery. We came to another small Buddhist temple built over the entrance of some caves, the abode in very ancient times of ascetics. They are now used by the attendant monks as dormitories, and contain only Chinese plank-beds, with a piece of matting and a bamboo pillow as bedding.

At last, on reaching the top of a long and steep flight of steps, there was the open gateway of the monastery enclosure not twenty feet away. We passed at once into a quadrangle, on three sides of which were substantial earthworks about ten feet high as a breakwind, while the fourth was taken up by a low, granite-slab building, in the centre of which was the one and only entrance. There was nobody about, so our caravan marched up the steps and through the doorway into a chapel, in which was seated a monk apparently in meditation, or, what is more likely, indulging in a snooze. Our abrupt entrance gave him a start, of which we took no notice; but, headed by one of the soldiers, we went round the shrine and out into a small courtyard, crossing which, we went up some steps and along a cloister, until the soldier stopped my chair, out of which I stepped joyfully. Our advent had all the appearance of a forcible entry. By this time some monks had gathered round, astonishment being clearly depicted upon their countenances. The soldier presented our cards, and we were shown into the reception-room, and then into our cell, to which such of our belongings as we required were taken.

Our cubiculum was about ten feet square, with a damp, earthen floor. Its one window was barred with wood, and instead of glass there was oiled paper, which, if it was intended to obstruct the light, was certainly successful. The furniture consisted of three plank-bedsteads, one small table close under the window, and one stool. When the charcoal-pan fire was brought in great care was required in moving about. As we had our meals in the reception-room, the smallness of our bedroom did not cause us much inconvenience.

Presently one of the soldiers came in and told us the abbot had come to visit us. Going into the reception-room, we saw a little, burly old gentleman, who 'chin-chined' and greeted us with smiles and words of welcome. His kindly, genial face contrasted well with the ascetic-looking cowl, while the yellow robe of his order

gave him an importance not justified by his stature. I took a fancy to him at once. After the usual complimentary exchanges so dear to the Chinaman and so essential in Chinese etiquette, he invited us to partake of a little refreshment he had ordered to be brought in. There were sweetmeats of various kinds, and tea. In accordance with Chinese custom and in deference to my age (seventy), he put me at the head of the table, while as host he sat at the bottom. He was assiduous in helping me to the various confections, and some that were curious in form he parted for me. He inquired where we had come from, and as Australia was an unknown country to him, he had some difficulty in comprehending the distance. He asked how old I was, and expressed his wonder that a man of my age should come so far to visit the mountain in the middle of winter. During all this there were congregated in the room over a score of monks and coolies, who stood stolidly staring at us while we ate. The abbot gave us an invitation to dine with him, and presently left, the crowd making a lane, through which he passed, his ample yellow robe sweeping behind.

We lit our pipes, and strolled to the outside enclosure to look round. Not much was to be seen. The landscape was quite shut off from us by the clouds, only the rugged mountain-tops being visible. Overhead, the lowering aspect of heavy banks of clouds seemed to portend a coming storm.

The abbot came out and invited us to his cell. It was furnished similarly to our own, but with only one bedstead, while it had two bamboo easy-chairs. Tea was brought in, pipes were lit, and a cigar offered to the abbot was accepted with a beaming face. There was no mistaking the relish with which it was sucked—I cannot say smoked. In a little while he launched out into a dissertation on Buddhism, but he talked so rapidly, and in a dialect not Pekinese, that my son had sometimes a difficulty in following him. I told him that I had studied Buddhism, and much admired the beauty of its teaching, at which he was very pleased; but when I gave him the sacred mystic formula, '*Om Mane Padme Hum*,' he got up and made me a low bow, and repeated to me the Chinese formula, which I afterwards wrote down phonetically—thus, 'La Mo O Me Tan Fu.'

The abbot's dinner was laid in our reception-room, which earned its title by again 'receiving' about a score of monks, who gravely looked on while we dined. On the table were six or seven bowls of hot vegetable stews and a large bowl of rice. I recognised beans, bean-cake, turnip, and cabbage; other vegetables were unknown to me. Having been through an apprenticeship in the use of chop-sticks, I did fairly well; but of course it was a tame affair when compared with the ordinary good class Chinese dinner.

We next adjourned to our cell, the abbot introducing a monk, the second in command. They eagerly accepted cigars, but refused whisky. We then made some cocoa, which, though they were tasting it for the first time, was thoroughly enjoyed, and a second cup gladly accepted. We promised the abbot to send him some, which in due course we did. Some months after we had a letter of thanks, in which he asked us to tell him how to make the 'foreign tea.' Our instructions had been evidently forgotten. We made anxious inquiries relative to the whereabouts of a certain very ancient inscribed stone, to obtain a rubbing of which was one of the objects of our journey. The abbot kindly offered to send a monk as guide. Meanwhile the storm had burst, and the roaring of the gale and the pattering of the rain added to our appreciation of the snug inside.

Early next morning, to our great delight, we found the regions above quite clear. After breakfast we visited the small temple on the topmost crag. By this time the sun had risen considerably, and the panorama presented to us was both novel and fascinating. Two or three thousand feet immediately below us was an amphitheatre among the mountains, in which could just be discerned a farmhouse and some terraced paddy-fields, up the lower slopes of which crept the snow-white clouds. To the left was the lower-level continuation of Nan Yo Shan, up whose corrugated sides there seemed to surge a glistening mass like a foam-crested wave upon the seashore. To the right, where the elevations were evidently less, was an ocean of silver, whose placid expanse was only broken by protruding tops of hills which had the similitude of rocky islets. I had never before seen the sun shine *down* upon cloud-masses, and the feeling of pleasure I experienced was that of an entirely new sensation. Alas! in a short time clouds again obscured the king of day.

Turning from this entrancing scene and entering the little temple, one felt painfully the contrast. Its single door admitted just sufficient light to discover its dirty and neglected condition. The shrine of the Buddha was dilapidated and in keeping with its surroundings. The only indication of life and cleanliness was the burning incense and the tiny flame of a lamp upon the altar.

We spent the rest of the morning leisurely strolling round and taking several photographs. Once the abbot took off his cowl and placed it upon my head, his face beaming with gratification. I asked if he would let me put on his robe and have a photograph taken in it, which he did without demur.

After *tiffin* my sons, accompanied by the monk-guide and three Chinamen, started across the mountains two or three miles to take a couple of rubbings of the ancient inscribed stone. When I was left alone with the abbot, he took me by the hand and led me to his cell, where he motioned me to take an arm-chair and have a sleep, he com-

posing himself in the other. Some time after a monk brought in tea and sweetmeats, of which we partook with solemnity. Then going over to his bed, the abbot brought forth a rich silk fur-lined robe, which he placed in my hands, evidently for my approval; and when I had expressed it by dumb motion, he commenced to undress. Under the yellow robe was one of silk lined with fur, then a sheepskin coat, and he stood revealed in a quilted cotton jacket and short pants. The transformation was remarkable. From a burly, thick-set man he became a slim, little fellow, his genial face only remaining of his former self. As he re-dressed in other garments of a like nature, and finally in the yellow robe and cowl, he became a burly monk again.

Having given him a cigar and lit my pipe, I went out with him and took a general survey of the interior of the monastery.

The buildings are not extensive, and their plan is simple in the extreme. They form a quadrangle, the sides of which measure about a hundred feet. The outer walls are built of massive blocks of granite, through which access is obtained by one gateway only. Erected against the inner sides are a series of buildings, also of granite, used as living and sleeping rooms, kitchens, store-rooms, &c., bordered by a pillared cloister running round the entire enclosure. In the centre of the granite-paved courtyard stands the temple; its gloomy interior was decorated in the usual manner, figures of saints were ranged along the walls, and there were bells and drums, burning incense, and other accessories of worship.

As we strolled along the cloisters my risibility was sorely tried when I glanced at my companion, a Buddhist monk clothed in the yellow robe instituted by Gautama himself two thousand five hundred years ago, walking about smoking a cigar. The incongruity was perfect.

The temple bell tolled for a service, and I went in, the abbot finishing his cigar outside. In front of the enshrined Buddha twelve monks were kneeling in two rows of six each, while standing a little on one side were two more monks in charge of the drums, gongs, and bells, the soft, melodious tones of which made a fitting accompaniment to the singing. The chanting was in antiphon; as the one choir sang the foreheads of the other touched the ground, and *vice versâ* every alternate verse. At intervals a kind of doxology was sung by both choirs, during which one of the musicians advanced in front of the Buddha, swung a censer of burning incense aloft several times, made a low bow, and returned. Then the chant was changed. The last one, in very quick time, seemed to carry with it an idea of an imploring nature; suddenly it changed to a soft and solemn dirge which both choirs murmured with foreheads touching the ground; then one musician advanced and swung the censer, while the other softly tinkled a silver-toned bell. It forcibly reminded one of the ceremony of the elevation of the Host in a Roman Catholic church. The service was certainly impressive, the gloomy surroundings without doubt adding an element of solemnity.

We spent the evening in our cell as previously, the abbot giving us some hymns and religious exercises. Meanwhile the storm-king had again marshalled his forces. The howling wind and pelting rain suggested the possibility of an enforced stay on the morrow; but our good luck was still with us, for in the morning the sun rose in a fairly clear sky. The abbot and a number of the monks accompanied us to the outer gateway. The farewells to and from the kindly group did not take long. The abbot, adopting for the nonce the foreign fashion of salutation, grasped my extended hand within both his own and gave many blessings. Of all the many pleasant picture-memories this unique trip so often affords, none seems complete without the portraiture of the genial face of the good old abbot of Nan Yo Shan.

Our descent was as rapid as possible. In due course we entered the clouds, and upon emerging found it pleasant to look on the face of the earth again. At Nan Yo we hurried to the Buddhist temple to take a photo of the crematorium and grave. To our surprise, we found the brickwork of the opening of the crematorium had been taken down, and inside a lot of wood had been stacked for another burning. Just outside was a box on four legs like a meat-safe, which the priest-guide told us contained the body of the deceased. We went back to where some funeral meats were laid out and priests were performing a ceremony. We were informed we must not be present; neither would they allow the camera to be used. They were ignorant of the photo we had just taken of the crematorium, so it is possible that the picture is unique.

We hurried on our journey so that we might arrive at our junk before dark. Everything was in readiness, so we started at once, and reached our home at Chüchow before midnight of the following day. The trip was most enjoyable and interesting, and gave me an experience that falls to the lot of but few.

HOME MEMORIES: A SCENE IN CHINA.

THE autumn floods were high, the rivers hoarse,
Thick waters whirled past rock and palace-wall,
Dark waves were dashing on with noisy force,
The air was ringing with the kite's shrill call,
And fitful sunshine gilded tree and shrine;
Far up the height an ancient temple stood,
Deep hidden by the shade of oak and pine;
Tall deer leapt through the fiery-shrouded wood,
The long, swift rays of light began to slant,
Day slipped away in throbs of glorious pain!
And through the dark I heard the Lamas chant
With wailing, slow exactness; and again
The same weird strain. And from the fluted hill
Night drew faint music with her falling rain,
And in the sky the wandering winds were still.

SEVENTH SERIES

THE MINISTER.

By FREDERICK WATSON.

TO the making of a minister go three generations of the manse and a sound grounding in the classics. Without these a man may go far, and even pass among unsuspecting persons as a pillar of the Kirk, but in the presence of discerning people he will not conceal his imposture for a moment. With these advantages a minister advances in a steady, authoritative fashion from college to an Edinburgh assistantship, thence to a parish favoured by his ancestors, and soon he will be in an Edinburgh charge of his own. The time will come when the Moderatorship will no longer be an empty dream. People will like him because his name is so familiar and respected. Elderly ministers will have known his father, patriarchal ministers his grandfather; and such is the power of tradition in Scotland that even the repose of his great-grandfather will be comparatively unsafe. But for the poor creature whose father (possibly a well-meaning man) was a well-to-do tradesman there is little appreciation or promise. 'Ye mind his feyther's stores' will be his introduction; and he will learn in a thousand ways that he carries the atmosphere of a commercial upbringing into the sacred profundity of a critical circle.

The Rev. Andrew Douglas was a son of the manse, and as such one of the elect; but, to the righteous indignation of his intimates and fellow-students at the Divinity Hall, he never seemed greatly impressed with the advantages which a kindly Providence had showered upon him. He was not a distinguished scholar in those days, and the Professor of Hebrew even went so far as to say that he must be grand at the Greek, for every man had his aptitude for one language, and his was certainly not Hebrew. The Professor of Biblical Criticism made much the same remark, only he expressed himself from the other standpoint. But the Professor of Divinity never complained, for Andrew Douglas had an insight into the purposes of God which is given only to the few. His fault was his indifference to personal success and his contempt for technicalities of Hebrew or Greek grammar. This deprived him of distinction and applause. It made the Presbytery wag their heads and the examining board of the Divinity Hall look sorrowful. But Andrew Douglas cared not a button for that. To him the Professor of Hebrew was an insignificant little man, whose antics at the blackboard were grotesque, and whose gratification at a piece of correct parsing was a lamentable exhibition of misguided enthusiasm.

The Professor of Biblical Criticism, a tall, tragic-looking man, bewildered Andrew. The Professor of Hebrew was a child, and behaved as such; but here was a grown man, with dignity, depth of thought, somewhat impressive. But when he attempted to follow him through a network of doubtful references and quotations linked together by speculative theories of German theologians, and terminating in something akin to chaos, Andrew Douglas could only stare, abashed and perplexed that a professor could be so seduced by empty conundrums. It made him think of a man wrestling with the wind.

Andrew became president of the Theological Society, elected principally because of his social position and the great future which everybody said lay before him. He was not a notable success. The divinity student is too often a diplomat in matters of his beliefs. He guards the secrets of his conscience as the ambassador of a foreign Power conceals the scheming of his Government. He fences and learns to talk widely with catch-phrases and quotations only less subtle than those heard in the Assembly itself.

It was the debate on the Formula which covered Douglas with a cloud of disapproval, and made shrewd students steer clear of his embarrassing company in the future. To his straightforward and ingenuous mind the Formula, which the Southerner knows faintly as a parallel to signing the Thirty-nine Articles, was a statement which must either be taken literally or not at all. He dealt, in his youthful enthusiasm, with the items in which it was obligatory to confess belief. He mentioned half-a-dozen of the more outrageous, amid a forbidding silence. He even asked how those members who were in their third year were prepared to put their hand to it at the end of session. And then he resumed his seat.

The various speakers who followed expressed a profound pain at his attitude. They wondered how any one could imagine for a second that the

 [*All Rights Reserved.*]

signing of the Formula was not to be taken on a broad basis—more the spirit than the letter. They referred to great and good men who had signed it, and the applause was prolonged.

At which Douglas responded that an understanding so contrary to law or morality was unparalleled, and asked how a business man would take it if a confrère signed a contract and did not deliver half the goods. But that was regarded as beyond the point, and the subject was turned, in the dexterous manner of debating societies, into other channels.

Andrew Douglas entered the Church under a kind of protest. Sign the Formula he did, but on a specific understanding, which was hushed up and pooh-poohed, of what his beliefs really were; and from that day he was regarded as a disappointment, and even a weak vessel.

It is as an old man I wish to speak of him, for it was as such that I had the honour of his friendship. His little kirk was full even when snow lay heavy on the ground, and the sight of dark forms fighting their way down the opposite brae in winter was one to be remembered. The roadway was lined with conveyances of every description during Sunday service. From the laird's quaint barouche—which Angus MacGregor, the church-officer, swore had carried Prince Charlie—to the donkey-cart of old Mrs Scott from Glen Quayleside, from the smart motor of the Tomkinsons of Finnan Castle to the high dogcart of Dr MacAndrew, there they were in a long line, and the horses picketed under the trees.

The kirk was dark and cool, with the sweet odour of oak and old books and the honeysuckle at the open window. The pulpit stood facing the gallery, and above the heads of the folk downstairs. It was a moving spectacle to see Angus, with his Sunday blacks and white tie, walk solemnly up the pulpit-stairs and lay the Book down with a dull thud. It was a reverent thud, mark you, not an ostentatious bang; just what one of the elders called 'a decent, respectable, God-fearing independence.' But all this was as nothing to the sight of the minister entering the pulpit.

In the vestry a little ceremony was enacted every Sunday. At three minutes to eleven Angus entered the room and said, 'Shall I tak' her up the noo, sir?'

To which the minister answered, 'I'm thinking ye might, Angus,' as though such a thing had not happened every Lord's Day for the last forty years. And at that Angus grasped the Book.

Then, when the clock was counting the sixth stroke, the minister had entered the pulpit. He stood there, facing the congregation, in his black gown and cassock, and with the long white bands under his chin, his hands holding the sides of the book-board. At the last stroke of eleven his white head bent reverently. 'Let us pray.' The accents of his sweet, soft voice crept over the small, dark kirk and out at the open window. There was a sudden rustling and the creaking of seats. The service had commenced.

It was forty years since the minister had come to Abercraig. He was a young man of twenty-one then, just out of college. He had received 'calls' since that day, but had a horror of city life—the commonplace rows of houses, the social functions, the incessant round of trivial duties. He had married the doctor's sister; but she had died shortly after his daughter's birth, some twenty odd years ago.

The minister was beloved by old and young, and by all horses and dogs; also by wanderers, vagabonds, tramps—call them what you will—who sat for a while with him, and smoked his tobacco, and possibly had a slice of beef and a glass of beer, and talked all the time to the minister as to a man who understands and does not expect every out-at-elbows human creature to pocket his forks.

The minister's attire was quite unpretentious, and often soiled with excavations in the woods or by the release of Dandie the Scotch terrier from rabbit-holes. This was of constant occurrence. A series of muffled barks directed his anxious footsteps to the correct hole, and he would bend down, and then a momentary silence fell.

'Dandie dog, are ye there?' he would inquire, at which there would be a torrent of frenzied appeals for assistance.

Perhaps the minister would hesitate a moment; then, 'Dandie dog, can ye no' work yersel' nearer? Ye see I've got to prepare an address for the bairns, Dandie; and I canna speak on the Prophets, because that's for the young men, an' the Psalms is a terrible business before the morn's morn. Dandie, can ye no'?'

There would be a furious scuffle at that, and silence again.

Then the minister would shake his head sadly. 'It's no use, Dandy; ye're unco broad. If I could only get a grip o' your tail! It's no use. I'll bring the spade; and, mind, dinna move an inch, and tak' no notice what the rabbits say.' The minister had a theory that Dandie suffered insults of an intolerable kind when placed in an unfortunate position like this. Then the digging would commence—the minister with his coat off—and sometimes people who were passing would jump the dike and run to help him. It was a sight to see the minister and the laird taking orders from George Macpherson, the poacher's son, who had a crippled foot and could not dig, but who knew the make of a rabbit-hole as well as his own cottage, and had the ears of a hill-fox for the exact position of the prisoner.

'Meenister,' he would cry, 'there's nae guid grumphin' and pechin' like that when ye've turned yir back on the hole.'

'Give me the spade, Andrew,' the laird would say hotly.—'An' dinna speak, ye keelie, or I'll thraw yir neck like a muirhen's!' At which the laddie would laugh, knowing well that the laird, for all his strength, had never been known to harm man or beast, much less a crippled bairn whom he largely clothed and fed.

At last Dandie gave warning that the spade had touched his tail, and at that the minister, taking a firm hold, brought him to the daylight with a rush of flying earth. It was popularly believed in the village that his tail acquired an inch in length every year, and persons of a fanciful temperament saw the time when the minister would have no need to dig at all.

There are ways of estimating the qualities and habits of a man without ever seeing him face to face; and perhaps the surest criterion is his house, and, if he possesses one, his study. The minister's study was a large, rambling, oak-beamed room; and, as in all good libraries, the wall-paper was completely concealed by book-shelves and the carpet almost covered by books. This gave the room a somewhat sombre appearance, but such as is dear to the bookman's heart; and the homely smell of ancient bindings met one like an old friend in the passage outside. The French windows opened out upon the lawn, which is as near as heaven can come to the bookman; for when he is stiff or chilled with study he can take a favourite volume out into the sun, and mingle Scott with the scent of the roses, or *Esmond* with that of clinging honeysuckle; and with this little break of light refreshment, he returns much heartened for heavier reading.

It was evident that the minister was a sound theologian, as every minister should be, for even a casual writer could not but notice the red-coloured series of the Theological Translation Library and the blue row of exegetical works. On the writing-table, too, on a sliding shelf, were half-a-dozen new books from a library, dealing with various aspects of religious thought. But it was evident his tastes were largely literary, for, besides the *Hibbert Journal*, on the floor were scattered all manner of magazines and quarterlies—the *Spectator* and the *Athenæum*.

One could see, if one were curious, that the minister was a book-reader rather than a lover of rare copies. For the book-lover in this sense is careful and anxious regarding bindings and type and woodcuts; but the lover of books has an insatiable appetite for good literature. He will probably break the back of a volume with a sharp crack when a really telling point is reached. The greatest scholar I ever met read a book with wetted thumb, rending the uncut pages with a somewhat neglected forefinger.

The minister, like all solitary men, was not without his peculiarities; but his sweetness of disposition made his little frailties the more loved. He was a staunch Tory, and—like Scott, whom he considered the greatest of novelists—a trifle autocratic and careful of class distinctions, and a great stickler for etiquette. His manners bore the stamp of the old school, very courteous, placid, and graceful; and as he stood chatting in his study he took snuff at intervals from an old silver box which had seen service in the Forty-five.

His failing of absent-mindedness was familiar throughout all the countryside. Why, the tales were innumerable. How he once travelled to preach at a certain church in Stirling, and, having to change his train, became much flustered, and forgot his destination. Sympathetic passengers and porters, who all knew him, did what they could. They mentioned various places; they even hunted newspaper advertisements to see if he was billed to preach anywhere near. It was all of no avail. At last a clever person suggested telegraphing home for information. He wired to his daughter, 'Where am I going?' to which she replied very shrewdly, 'Look at your ticket,' to the satisfactory conclusion of his journey. Also, how he invited a young child to play with his motherless girl; and as evening drew on, and deeming departure advisable, he put the terrified stranger carefully to bed and hurried his lamenting offspring into the night.

But there was a classic centred round a certain visit of his to Edinburgh. He desired to visit the university, and, being somewhat fatigued, decided to take a tram-car. There was another man seated inside, and half-an-hour passed quite pleasantly. But at last the minister, becoming impatient, turned to his companion. 'Are we near the university?' he asked.

The man stared without comprehension for a moment; then, 'Sir,' he gasped, 'this is no' a tram-car; it's a cabman's shelter.'

Such was Andrew Douglas, who is now gone; and few remain, if any, who carry into this time of unrest and commercial upheaval so much of the rich endowments of a forgotten age. In his presence and speech he was a stranger to modern ideals and conceptions, and latterly he shrank more and more into the seclusion of his study and his garden.

It was in that garden that I saw him last, and as I said good-bye he held my hand for a moment in his own.

'Good-bye,' he said, but nothing more. Perhaps he knew it was.

But I shall always see him standing there among the flowers—white-haired, with a book in one hand, smiling to me—through all the years which are passing between us.

THE CAHUSAC MYSTERY.

CHAPTER III.—THE AFTERMATH.

IT has been said that a secret is made for the pleasure of being imparted. But there are some few secrets to which no manner of pleasure can by any means be attached, and such run an excellent chance of being kept.

Thus the secret of all that took place on the stormy April night in Park Lane was still inviolate, although close upon six years old. Lady Cahusac had carried the mystery with her to the grave. No coherent word had ever passed her lips, filled to the last with tireless laughter. On the day of which we write there were three men living who very literally shared the secret of that evening between them. Each held a partial knowledge of it, but no one knew the whole. Probably De Sarsan's information was the most complete; but even he was ignorant of what had happened after he drew the door quietly after him and walked deliberately away down the pavement—so deliberately, indeed, that he had stopped under the next lamp-post to light a cigar.

Malcolm himself was the second participator. He guessed that the blow from behind which had felled him as he opened the cabinet drawer had been dealt by the man who had blackmailed Lady Cahusac; for, later, when search came to be made, the letters had disappeared. It seemed that the thief must have entered by the front door, either by collusion with one of the household, or more likely still by means of a latchkey, for the lower stories of the house were found shuttered and barred, and showed no sign of violent entrance anywhere. So far went Malcolm's knowledge. The third individual who shared some acquaintance with the events of the night was Surgeon-Major Detching, home from the Rock on three months' leave, who chanced to stroll past 241 Park Lane at the precise moment when a posse of terrified servants rushed out. Detching attended to Malcolm, while a local doctor placed himself in charge of Lady Cahusac.

So it happened that when Malcolm opened his eyes he saw a red-brown face with a wiry, reddish moustache bending over him. 'What is the matter?' he asked vaguely. Then remembrance overtook him in a furious blast. 'My God, I know! The letters!'

Detching laid hold of his wrist. 'Keep quiet. More troubles are mended by living than dying,' he said dryly.

Malcolm's drawn features did not relax. 'The letters were in the drawer of the cabinet—I saw them—then I think I heard a noise behind me. But the letters?'

'There were no letters anywhere visible when I came in. The drawer was open, but empty. Here is the key,' said Detching, who disbelieved in the cruel mercy of breaking bad news by degrees.

Malcolm raised himself in strong agitation. 'He stole them — the man who struck me!' he whispered. 'You don't know what the loss means.'

'No, I don't know; but from what I can guess you had better get well to look after the business yourself, instead of leaving other people to ferret out more.'

'Ah! Then I have been talking'——

'Yes, some.'

'And I 'm hurt?'

'Yes,' replied Detching; 'pretty badly, in fact. If you had not moved a little when you heard that noise I don't suppose your assailant's life-preserver would have missed the vital spot.'

Cahusac opened his eyes with an effort. 'I am likely to talk—delirium?'

Detching bent down his hairy, red ear, for the wounded man's words were barely audible. 'Probably.'

'I don't know who you are, but'—Detching nodded comprehendingly in the pause—'don't let any one else hear; stay'—— and then the little doctor's patient fainted for the second time.

In this way it came to pass that Red Detching, who was well known and perhaps equally well liked over a large portion of the globe, spent his furlough in dragging Malcolm Cahusac back to life.

What confidences Cahusac was betrayed into, first in moments of delirium, and afterwards in the facile moments of bodily weakness, only Detching ever knew; but he succeeded in sending the young man back to face the world strengthened, matured, and proven, and with one purpose dominating his life. He took up his old position in society, and presently entered the Foreign Office, as his father had done before him; but, although he was always on the alert for any hint connected with the past, none reached him. On the contrary, many excellent things fell in his way, and he was placed in positions of responsibility, because, as it was made clear to him, his father's son was held worthy. During these six years Cahusac had done nothing whatever towards discovering the identity of the person who had dragged so terrible a trail of disaster across his life. He was always alert and waiting, yet no remotest hint reached him that the unspeakable truth about his unhappy step-mother's surrender of the diplomatic documents was anywhere suspected.

Not that his own intention from the beginning ever wavered. The aim which informed

his whole life from the moment he came to his full senses, and felt Detching's hand upon his wrist, was to find out the traducer, and exact from him a revenge, the completeness of which he brooded over and thought out through many a long hour of the day and night. His delay was not the delay of supineness, but the delay of calculation and foresight. The Malcolm Cahusac who took up the burden of life again four months after the attack in the library was a man with a fine balance of character, struck even by that sledgehammer blow of fate. The irresponsible ups and downs of youth, the sweet fling upwards of the scale in some exalted, ecstatic moment, or the almost equally sweet drop with enthusiasm or a dim melancholy to weight it, were gone for ever; but the poise that remained was of a rare value in its combined strength and delicacy.

The gap between boyhood and manhood is wide, and some spend many happy years in the transit; but if a man be flung desperately across the gulf the shock is apt to make or maim him for life. It was hard to tell yet what the ultimate result would be with Cahusac. To begin with, he comprehended well enough that the old proverb, 'Least said soonest mended,' applied most particularly to his own case. He put aside the impatience natural to his years, and took up his career; he entered the Foreign Office, and soon bade fair to rise to his father's eminence at an equally early age.

Cahusac felt the need of attaining a high position; he well understood that to strike strongly one must strike from above. Also, he must unravel those intricacies of diplomatic method which it had become the object of his life to master and to use for his own ends.

How far Detching's dry aphorisms and cool, high views of life helped to bring out good from the evil it is not necessary to examine; but that they had worked largely towards that development Cahusac held as a fundamental article of faith. When Detching happened to be in England the two spent a good deal of their time together, mostly in silence, which did not in the least interfere with their liking for and increasing knowledge of each other. Curiously enough, since the day they parted as doctor and patient, the subject of Park Lane was rarely mentioned between them. It may have been that Detching had counselled Cahusac's steady line of conduct in laying a sound basis of reputation for himself, while at the same time occupying a place in the very ear of rumour as far as the ultimate object of his life was concerned. It may have been that Detching was waiting for that turn in the road, that first gleam of light in the tunnel, when, if Cahusac wanted him, he had only to say so.

This attitude was consistent with the whole of Detching's life. He always described himself as a 'passenger.' 'I know where I individually want to go,' he used to say; 'but I am never skipper and never guide; I have no responsibility.' But he was a passenger always ready to lend a hand on occasion, and capable of lending it with effect. In observing Cahusac, he recognised that the man was not forgetful, not passive; he was only waiting, holding himself in reserve until the call for action came. Cahusac's silence was the wall behind which lay an entrenched resolve and slowly growing powers.

Detching, stepping out of the Dover train on a Saturday afternoon in winter, caught sight of two men on the platform, with both of whom he was acquainted in a somewhat intimate sense. Judging from this knowledge, their evidently friendly attitude towards each other surprised him considerably. After a slight hesitation he went towards them.

'Hallo, Detching, glad to see you home again!' Cahusac turned, with a grip of the hand; but Detching noticed that the old shadow dropped back over his face. 'Congratulation on the D.S.O. It should have been something better. Ah, I see you know Lanceley!'

The third man laughed. 'It is my misfortune that my friends usually know a great deal too much about me,' he said, with a glance at Detching, whose greeting was not marked by any especial warmth. 'Detching had more than he cared for to do with me at Alexandria three or four years ago.—I let you in for a lot of trouble then, but here I am to the good still, thanks to you, I dare say.—I'll tell you what 's wrong with Detching, Cahusac. He never was a boy.'

'And you 'll always be the same sort of boy,' rejoined Detching rather dryly.

But on the face of it, this seemed the best compliment that could possibly be paid to the young fellow, who, though handsome, derived his chief fascination from that essential boyishness of aspect and manner which very rarely survives the age of manhood, and still more rarely in the form of an irresistible trait, as in Lanceley's case. To those who have known some such man it will only be needful to recall to them his invincible charm and the quite exorbitant hold he gained upon the affections.

'I do not ask for anything better.'

'Yes, it pays,' said Detching indifferently.—'Are you going out of town to-day, Cahusac?'

'To Ashmills till Monday, with Lanceley. And you?'

'Oh, the old place. See you some time. Hallo! there 's a female clutching my uniform-case. Well, I 'm off.'

Half-an-hour later, as Cahusac and Lanceley alighted at a little wayside station in Sussex, the latter put a question. 'I 'm astonished at your knowing Detching. He keeps pretty close to barracks in his acquaintance.'

'My experience is that every one knows Detching,' replied Cahusac in his usual tone.

'He don't seem much in your line of country. How did you come across him?' continued the other.

'By chance. And circumstances have thrown us together more or less since.'

'Know him well?'

Cahusac looked at him absently. 'I suppose so,' he said.

Lanceley laughed. He covered a variety of emotions with his careless laugh.

'We chaps in the British F.O.
All lie so uncommonly low;
If one says to another,
"Is that man your brother?"
The reply's, "'Pon my word, I don't know!"

You're almost ideal, Cahusac!'

Cahusac still looked at him, now with a shade of amusement. 'Thanks! I have always been in search of the ideal; not this ideal, perhaps, but it's no matter. Any ideal is better than none.'

Which remark was beyond Lanceley altogether. 'What the deuce do you mean?' he asked with a hint of temper.

'Nothing, probably. We were talking of Detching, and then you threw my trade at my head. Where's the connection?' returned Cahusac. The very sight of Detching had roused the old bitter thoughts into quickened energy.

'Hang it all! how do I know? Though, I can tell you, there was some rumour about Detching the last time he went to Africa. People said he was sent to arrange more than the hospital base for the expedition,' he explained rather sulkily. 'Your political agent may be any one nowadays.'

The train disappeared round the curve of the line with the usual apparent flick of its tail as a man stepped swiftly from the waiting-room and approached the two young men, who were standing with their backs towards him. He caught the last words as he came up and permitted himself an unseen sneer at the back of Lanceley's head before he spoke.

'Politics, my dear Lanceley,' he observed, 'are forbidden outside the four-mile radius.'

Lanceley appeared almost startled as he turned. 'What in the world are you doing down here, De Sarsan?'

'At this moment I am waiting for an introduction to M. Cahusac, whom I have not had the pleasure to meet before, although by sight all the world knows him.' De Sarsan bowed as the necessary words were said. He was a rather swarthy man, with a well-trimmed dark beard and quick dark eyes. His dress and aplomb of manner proclaimed him a man of the world, and his slight accent that he had been born on the Belgian side of the French border. Behind his smiling eyes he was waiting for the first glance in Cahusac's when his own name should be pronounced. But Cahusac merely bowed coldly in return, upon which De Sarsan decided that he held the other at a disadvantage.

'I begin our acquaintance with a request, monsieur,' the Belgian went on. 'Your dogcart is waiting; may I beg for a seat as far as Lady Fettering's south lodge?'

'With pleasure; though the dogcart is not mine, but Lanceley's.' Cahusac was pointedly ceremonious; but, as De Sarsan reflected, the English have some prejudices—what would you? He on his side possessed a reputation.

'I walked over to the station this afternoon,' explained De Sarsan, 'to superintend the sending of a telegram in cipher. The amiable young woman in charge of the office here is an unconscious wit. My last message became, under her manipulation, one stupendous joke!'

Cahusac made a suitable reply, while De Sarsan idly noted that the young man had the point of a scar just showing below his hair at the back of the right ear.

'I say, De Sarsan,' called out Lanceley as the Belgian got out of the trap, 'come over to-morrow. My aunt and Alice will be glad to see you.'—'He's a very decent sort,' he remarked a little later.

'As you said yourself, Wil, your politician can be any one nowadays—or anything,' replied Cahusac.

(To be continued.)

EARTH-MOVEMENTS.

By ALEXANDER W. ROBERTS, D.Sc., Lovedale, South Africa.

THAT our solid earth should throb and pulsate like some labouring Titan seems a circumstance of no ordinary interest to the plain man who knows very little about science; while to the scientist—the geologist or the astronomer, the physicist or the mathematician—it is a fact of exceptional interest that a sphere of such solid bulk as our earth, and of a rigidity comparable with the finest steel, should be, to some degree, mobile under the stress and strain of vast forces, for it forthwith relates our planet's history and evolution to that of every star in the sky, giving us, at our very door, striking testimony to the slow formative movements which change chaotic matter into stellar systems and nebulous masses into circling worlds.

And so, when recently at many observatories where minute movements of the earth's crust are recorded, there was abundant evidence that the solid ground, valley and mountain, rose and fell

like the tides of ocean, but with an exceedingly smaller amplitude, both scientific and unscientific men were keenly interested. The unscientific man was interested because it was a new thought to him that the foundations on which his cities were built, his railways laid, were as unstable as those of the sea. Nay, here were learned men who told him that the sea was more permanent than the land; that when an ocean rolled where tradition once said an Atlantis flourished in a far-back past, it was the land that had crumbled beneath the wave; that when a new continent rose out of the sea, it was again the land that was mobile. Why, if anything seemed permanent, it was the solid land! Yet here he was gravely told that this very solid earth rose and fell, rose and fell, rose and fell in rhythmic mood to the constraining notes of nature's music. When one comes to think of it, it is surely a grave averment this, that along the outer shell of our earth minute waves play constantly, just as they do over a field of ripe corn when the south wind blows softly! We need not wonder, therefore, that the unscientific man receives all argument anent solid tides in a solid earth with incredulity. To him they are an evident impossibility; they are against the apparent nature of things.

But to the scientifically minded man the averment is by no means strange. It would have been strange had the assurance been the other way, for then he would be compelled to conclude that the stupendous natural forces which are making and moulding other worlds have no place in ours; that the stress and strain which in past ages creased the earth's crust into mountains and valleys, turned oceans into continents, and submerged beneath the deepest sea vast tracts of land, have ceased to exist; that indeed the world is to all intents and purposes dead, and that over its once pulsating surface a final *rigor mortis* has descended.

How far this is from the truth recent seismological observations in Europe, in Canada, in South Africa, and in Japan amply testify. Observations taken with the delicate instruments which now are the equipment of first-class earth-tremor observing stations abundantly prove that the ground beneath our feet is in a constant state of stress and strain, of yielding and adjusting, of timid tremor or violent earthquake, of gentle undulatory motion or sudden death-dealing agitation, of quick, pulsating vibration or irresistible, age-long movement.

We shall, however, come to a better understanding of the matter if we consider what constraining and moulding forces act upon the earth's partly plastic bulk. Some of these forces act constantly, others intermittently; some through untold ages, others fulfil themselves in a few hours. And we may say here, with as much propriety as in any other part of this article, that what is true of our earth's story is true of every star that shines in the sky; and it is this consideration that gives to the question of earth-movements its importance. We are dealing with the moulding forces of the universe. For the same forces that bring tides to our shores, that cause the apparently solid rocks to rise and fall —as measurements made at Kimberley, Ottawa, and elsewhere have demonstrated—are just those very same forces that have graven stars and systems of stars out of formless masses of matter. From rim to rim the same formative law runs. The same compulsion that moulds a stream of liquid metal falling from a great height into perfectly spherical shot, the same constraint that rounds a rain-drop, is the same force, and none other, that has moulded and rounded every star that swings in high heaven. Perhaps one of the greatest triumphs of modern science is this unification of forces so apparently diverse in their action and scope.

But to our immediate story, the movements of the earth's crust.

One of nature's most universal and far-reaching forces is gravitation; it is the moulding hand of the great Creator, never halting, never weary. It reaches out to the uttermost star, and in its inexorable, relentless grasp the mightiest orb contracts, and, contracting, puckers and folds into myriad creases. Thus from a vast and almost formless mass of tenuous, nebulous matter, matter a million times rarer than the rarest atmosphere, there comes in the process of countless ages, of ages upon ages of slow, persistent, unceasing contraction, at last a blazing star or a spherical and habitable planet. It is with our own planet we are dealing in this paper. Such was its birth, its youth, its early manhood, as already insisted on in this magazine —'Is the Earth Old or Young?' (*Chambers's Journal*, vol. xi. p. 778).

During untold ages the earth has been slowly contracting, is still slowly contracting, round its central, ever-hardening core. True, its density is four-fifths that of hammered steel; but what steel could stand the contracting force—or, in other words, the weight—of all that goes to form our globe? Now, as the earth contracted mountain masses were thrown up in ridges, and long, sinuous valleys dipped in folds. To-day the same process is still going on. Slowly certain shores are rising out of the deep, and thus towns that two thousand years ago stood by the seashore are now inland villages; slowly, but certainly—for no buttress can stay the coming calamity—other shores are disappearing beneath the waves, and thus over what was once populous land the sea rolls. There is no quarter of the world where this secular movement, this slow unrest, due to a contracting earth, is not manifest. We do not speak of those creases on the earth's surface which we call the Andes, the Himalayas, the Alps, wrinkles on the face of our good green earth, telling that it is no longer young—slowly these were thrust up in

a far-past age as the crust drew together; but we do insist that in the present day in England and in Scotland, in Norway and in Holland, in Australia and in New Zealand, by inland seas and by wide-stretching oceans, some lands are slowly upheaved one foot a century, while other lands, again, are subsiding imperceptibly but surely.

While no instruments, however sensitive, could respond to this slow folding, producing mountains, or to this age-long swinging, producing oceans and continents, of their existence we have abundant evidence. Why, much of the story of geology is a tale of vast earth-movements! Now and again the enormous pressure of a cooling and contracting globe gets too great for even the solid rocks to bear the stress and the strain of it, and snap goes a rocky stratum. Then over the wide earth the jar is felt, in every observatory the delicately poised needles vibrate to the seismic waves that radiate from the centre of disturbance; while over the spot where the earth's crust has given way—perhaps only a few inches—devastation and death, such as we witnessed recently at Messina, mark one of nature's most awesome phenomena.

We will not linger over the dread horror of such calamities, but rather let us go down into some seismic chamber where finely balanced rods are spelling out the tale of what is happening in the earth's crust. You have seen a gate badly hung. You have, perhaps to your annoyance, witnessed how it swings over to the side to which the upright (!) post inclines. There is just such a tiny steel gate in this recording chamber. It is delicately—oh, so delicately!—hung on an upright steel rod fastened to the solid rock! See how this miniature gate swings, and swings, and swings; now almost at rest, now more rapidly, now slowly, very slowly, now in angry mood; then it quietens down, while in some region near, or perhaps remote, there is the crash of buildings, the cry of men in the agony of death, the scream of souls in mortal fear. Why swings our tiny steel gate? Because the rock on which the upright rests is swinging to the waves that travel through it as if it were veritable water!

The question may naturally arise: When will the contraction cease? Our earth cannot, of course, go on contracting indefinitely. There must be a limit somewhere down the years, and that limit will naturally be determined by the rigidity of the earth and the amount of heat it still holds. Now it is contended that when the contraction of the earth, following on the steady cooling of the internal fires, has pressed the materials which go to form its substance into the density of the toughest wrought-steel, earth-movements from this cause, this secular cause, will cease.

It would be wandering far into the realms of uncertain story to endeavour to give a date for such a day of death, interesting though such an excursion would be. For we know but imperfectly the rate at which the earth cools; and it is only from profound and often very uncertain astronomical calculations that we are able to arrive at a value of the earth's rigidity. Sufficient if we allow that there must be a day in time when the earth can contract no more. An attractive field of insight is opened up if we seek to consider what will happen then; but we think it best to leave the reader to wander forth at his leisure, unaccompanied by the writer.

The circumstance we have just dealt with—the earth's cooling and contracting—is the most potent cause in producing those long-continued movements which have turned this earth of ours into a region of splendid and varied beauty, the beauty of mountain and valley, the beauty of sea and shore. But there are other and secondary circumstances which give rise to small and relatively rapid change in the level and slope of large tracts of land. There is, to mention a few that modern research and equipment have made us acquainted with, the annual gathering and melting of winter snows; the seasonal transference of heat from one hemisphere to another; the ever-changing pressure of the ocean due to tides and storms; the continual and often extensive changes in barometric pressure; the daily, fortnightly, and monthly tidal action of the moon, and the daily action of the sun, on the solid as well as the liquid portion of our globe. Most of these, and other less potent conditions, have a measurable influence on the form of the earth.

It may be reasoned, however, that such circumstances and conditions as we have mentioned can have very little effect on the rigid bulk of the earth. One can readily understand how the mobile waters of the sea rise and fall as tides draw, or rivers surcharge, or winds press; but the solid earth is another matter. Surely the outer rocks, the adamantine foundations of things terrestrial, are not so pliant as to yield to the stress of accumulated snows, of heaped-up waters, of a superincumbent atmosphere, of tidal attraction? But they do yield!

We may put the matter theoretically thus: The earth is so perfectly poised on its axis that if a rose-leaf were to drop out of space on to its spinning surface it would straightway seek to adjust itself to the added weight, and would not rest till adjustment was made. Only perfect equilibrium rules in the gyration and goings of worlds. It is, however, no theoretical matter. Fifteen years ago a chain of observing-stations was instituted right round the world by an influential German learned society in order to determine the change in the position of the earth's axis due to the ever-varying forces—stresses and strains, pulls and pushes, contractions and expansions—which are constantly being exerted, some of them exerted rhythmically, on the

earth's solid bulk. The researches of this girdle of observatories have clearly established the fact that the poles of the earth are in a state of constant movement. True, a fair-sized square of carpet would cover all the wanderings of the North Pole; but the motion is there, is measurable, and is explainable. Explainable! Why, one hundred and fifty years ago the great mathematician Euler told astronomers about this errancy of the Pole. True, it is only in these later days that we have instruments refined enough to respond to the subtle changes that he knew must be there.

Then, again, the Cape of Good Hope Observatory has made extensive observations on the level, or rather the inclination, of the rocks underlying the suburbs of Capetown, and it has found that the level varies with the amount and duration of the summer rains. So complete have been the researches in this direction that the Cape authorities can, within certain limits, foretell the alteration in the lie of the rocks under the observatory in the course of the year. Let us not suppose that this annual seesaw is a crude affair, a matter of yards, or feet, or even inches. The change would be inappreciable to the keenest eye did it watch, unaided, the level of the rocks throughout the year. But there is the sensitive tell-tale level which dips now one way and now another, as rain is succeeded by drought and heat, and the superincumbent pressure on the Cape flats caused by sodden soil and far-stretching pools is relieved by the lightness of powdery ground and dusty roads.

What is still more impressive in this same direction of discovery is the fact that at many observing-stations along the Atlantic and Pacific there is accumulating evidence that the rocks that girdle the coast respond to the tide of waters that every twelve hours rise against its confining shores. As the tide flows in the level of the lands bends toward the sea; as the tide ebbs, and the enormous pressure of millions of tons of water is lessened, the rocks slowly move back to their former slope as do steel girders from which a great strain is removed.

Again, we would point out that this resiliency is not a matter of yards; probably three or four inches of a fall every tide is the measure of the amplitude along the face of a whole continent. But the whole ocean does not rise as a single mass of waters. The tide creeps along in the form of waves, so that when it is high-water at one portion of a coast, at places not remote along the same shore it may be low-water. Now, evidence is forthcoming that as this wave moves along any shore an answering and almost synchronous wave passes along the land, so sensitive is the solid earth to pressure and strain.

We shall not be surprised, unless our minds have risen in rebellion against the facts we have related, to learn that there is also abundant evidence that the earth slowly rises and falls in the course of a single day; rising up in a gentle tide under the influence of day, and sinking down again, as it were to rest, when the chill and darkness of night come on. It may be urged that this daily movement is simply the expansion of the land directly under the sun's rays. There seems nothing unreasonable in such a view, but rather the reverse. Indeed, if observation had not proved the existence of such a tide—a tide three inches in height, according to the Kimberley observations—we should assuredly have gone forth in search of some evidence regarding it.

But the sun's heat is not the whole explanation of the diurnal solid tide. For the difficulty one encounters is this, that the heat of the sun's rays on any day does not penetrate more than ten feet below the surface of the ground, and this is not sufficient to account for the observed alterations in level. They must rather be connected with atmospheric changes due to the alternations of day and night, and also with the direct pull of the sun on the materials that form the earth. To take the first circumstance, it is matter of common knowledge that the barometer is lower during the day than it is at night, lower in summer than it is in winter. Now, a fall of one inch in the barometer—and such depressions do take place—means a withdrawal of pressure from the surface of the earth of nearly a million tons in every square mile. We need not be surprised, therefore, that a sudden change of atmospheric pressure leads our home Meteorological Office to issue warnings to all miners. A rise of one inch in the barometer may bring some unsafe working down, and this may mean desolation to many homes.

Even a heavy shower of rain or a heavy fall of dew brings to bear upon the responsive and resilient earth a pressure measured in millions of tons. Let us suppose that over Scotland there is an unusual fall of snow. In our northern, imaginative way we speak of a covering over the land 'light as eider-down.' Our whole conception is that of weightlessness. Yet, put in figures, a heavy fall of snow over Scotland means that the crust of the earth at that spot is pressed down by the weight of one thousand million tons.

We have said that the barometer is higher in winter than it is in summer. There will come into the mind the thought that in the winter of any hemisphere many things conspire to give to that portion of the earth a heavier load than it usually carries. There is, as we have noticed, the heavier atmosphere, there are the unmelted snows, there is the sodden soil, there are the flooded rivers. Thus the hemisphere over which winter reigns must be under exceptional stress, and the tendency to adjust it comes at once into play. But no sooner has the adjustment got well under way than the excess of weight is transferred to the opposite hemisphere.

Of tide-raising influences, fulfilling themselves in a definite time, none is more potent than that

exerted by the moon. This ungenerously yclept 'inconstant' companion woos the hard rocks as well as the yielding waters with an intensity and a relentlessness that will not be denied, raises a tide on land—faint and elusive, yet certain and measurable—as well as on sea.

And now we have considered, imperfectly no doubt, the principal tide-raising factors. There are other and more hidden agencies at work; but these belong to the region of theoretical investigation. They have not yet had cast over them the certain illumination of observation and measurement.

There is one problem of intense interest which is intimately related to all we have been considering—namely, the rigidity of the earth. It is evident that if the earth, its rocks and its waters, were absolutely rigid there would be no tides. It is because water is more mobile than rocks that we have a higher tide in seas than we have on land. If rocks and seas were equally mobile, then there would be no ebb and flow of ocean. Every twelve hours a tide would rise round the world, but it would be a tide in which sea and land, lake and mountain, ocean and continent, would equally participate. What an extraordinary world it would be in such circumstances!—circumstances which, of course, are known to exist in many a plastic, semi-fluid star and planet.

Since Newton's day the problem we refer to—the rigidity of the earth—has been attacked by mathematicians and astronomers. The last great soul who brought the weight of his marvellous intellect to bear upon it was Lord Kelvin. He found that the rocks which comprise the earth, supposing them to be homogeneous from circumference to centre, represent a rigidity three-fourths that of finely hammered steel. As the surface rocks, we know, do not nearly approach this rigidity, the central core of our planet must have a rigidity utterly beyond anything we can produce in our laboratories.

Probably to many scientific men the interest of these curious earth-movements lies in this, that they relate our earth to the other orbs in space. Darwin, Poincaré, and other mathematicians have indubitably proved that, given a mass of nebulous matter, however unformed, certain forces will in the lapse of long, long ages, out of this unformed, rarefied matter, carve worlds—habitable worlds, and systems of worlds—habitable systems; and that these very forces are those which cause our earth to pulsate and throb, which bring tides into our harbours, and which have covered it with sweetness and beauty and brightness as with a garment.

If matter can be said to have life—and there are a few who aver in these later days that it has, of a very low order; at least it has existence—then earth tremors and throbbings, earth waves and pulsations, are a manifestation of that life. When they cease the end is not far off. We shall then be a dead world.

Thus the tale of much that concerns our own earth is, in dim outline, the life-story of other worlds. It is because of the universe-wide meaning of much that we have related that we bring the subject of earth-movements before readers of this magazine.

THE BANDIT AND THE LADY.

CHAPTER III.

'HOW I became a member of the Camorra I cannot tell the signore,' Cavalanci replied in answer to an eager question from Tredare. 'There are some secrets that cannot be told. But I became a member, and a trusted member.' He smiled grimly. 'They did not know me as Beppo Cavalanci, the Scourge of Calabria; but it was easy to gain a reputation for reckless bravery under another name, and at the end of three months I was employed in the Prince della Gravina's palace apparently as a porter, but actually as one of the Prince's *bravi*. When a prince descends to doing dirty work he needs not only protection, but other hands to do the actual work. Myself and three other supposed servants took turns in watching the great door of the palace, lest any of the Prince's enemies should enter. And the Prince della Gravina had many enemies. We had other duties besides, work for the Camorra, directed by the Prince, but in which his hand could not appear.'

'Was it not rash of the Prince to trust an unknown man?' Tredare asked, the incredulity aroused by this last statement creeping into his voice.

'The Prince had no reason to trust. He knew I was bound to obedience and silence by my entrance vow. The Camorrists dare not break their vows; death is the penalty. Few men have the courage of Beppo Cavalanci; and even I should not have dared to face the vengeance of the Camorra save for what the signore already knows. Does the signore recollect the sensation caused in Naples three years ago by the child of Baron Paolucci being kidnapped in broad daylight?' Cavalanci continued.

'Yes, I remember it perfectly,' answered Tredare; 'I was in Naples at the time. The child was returned to its parents after some days, but it was said they had had to pay a heavy price, and that the kidnapping was the work of the Camorra.'

'For once gossip was true. The kidnapping was the work of the Camorra, and Baron

Paolucci was forced to pay one hundred thousand lire [four thousand pounds] before the child was given up. The Prince della Gravina arranged the kidnapping; it was I who took the child from its perambulator, and the Prince received the money. The child was hidden for nearly a week in the Della Gravina palace.'

'So that was one of your duties—kidnapping children?'

'Not a noble occupation, I admit, signore; but I had learnt the password that would open the doors of the castle in Apulia. This kidnapping gave me the opportunity of leaving Naples. If I had absented myself from the *palazzo* without cause, suspicion might have been aroused. But here was a golden chance! The Prince had arranged that after taking the child from its perambulator I should rush to a waiting carriage, which would instantly drive away. In a particular street, the carriage was to drive into the courtyard of a certain house; there I was to hand the child over to a woman who would be waiting for it, and she was to leave the house by an entrance in another street. All this was carried out with the utmost precision. But that night I caused word to be sent to the Prince that I feared I had been recognised, for I was already being shadowed by the police. His spies found that the police were watching the house in which I had taken a lodging, and I received an order from the Prince to leave Naples for a month.'

Cavalanci's white teeth showed in a broad grin. 'The Prince, clever as he was, little thought that the police were watching my lodging because I myself had asked them to do so. The Camorra wants facts, not statements, from its members. I produced the police themselves! The next morning found me already on my way to Apulia.

'The Prince could not have found a more solitary or desolate prison for his wife if he had sought all Italy over. A huge castle, built of gray stone, surrounded by a high wall like an ancient city, it stood on a tongue of land round which rolled a swift and wide torrent. The castle thus stood on a peninsula, two sides of which were securely guarded by the rushing water. On the third side, a tower rose in the centre of the wall, and below was a gateway with two enormous doors, all studded and clamped with iron. The only means of escape from the castle was through these doors. I had formed no plan for the Princess's rescue, although by questioning the maid—who, poor wretch! was kept in prison lest the Prince should discover that she was in Naples, and have her killed—the head of the police had done his utmost to get me some information as to the interior of the castle and the number of people the Prince kept there to guard his wife. But the maid could give no help. All that she knew was that she and her mistress had been shut up in a large suite of rooms on the first-floor of the castle, all the doors of which were locked except one, which opened on a stone staircase that led into a high-walled garden. The maid said that the unhappy lady had made it a paradise of flowers, and the garden alone had saved her reason. They saw no one except a man who brought their food and waited upon the Princess at table, and a woman who cleaned the rooms. But neither the man nor the woman ever spoke, only shaking their heads when addressed.

'Once every three months a doctor came from Naples to examine the Princess and report upon the state of her health to her family and the authorities. This doctor was one of those who had signed the certificate stating that she was mad. He was the only human being with whom the Princess had speech besides her maid. Because he was a Camorrist, the doctor had to continue the first lie, and make a false certificate as to the Princess's madness every three months; but although the poor lady was shut away from the world because of the certificate he himself had signed, the man seemed to have some compassion for her, bringing seeds and plants for her garden, and wools and silks for her needlework. Nor was the maid's escape from the castle any guide towards making a plan for the rescue of her mistress. The simplest things are the most incredible, signore. There was a well in the Princess's garden which dried up in the summer-time. By the doctor's orders, when the well failed a large cistern in the garden was filled with water by a peasant woman, who with a large barrel strapped upon her shoulders made repeated journeys until the cistern was full. She entered the garden through a small door in the wall which was never unlocked save when the woman brought the water that was to save the Princess's flowers from dying, and on these days the Princess and her maid were prisoners in the rooms on the first-floor, the door opening upon the stone staircase being securely fastened. But one day, whilst the cistern was being filled, the maid, chancing to look from a window into the garden, saw the peasant woman lying prone upon her back amongst the flowers, and thinking the woman had fainted, she instinctively ran to the door to go to her assistance. To the maid's intense surprise the door was not locked, and running down the staircase, she speedily reached the senseless peasant. In vain the maid dashed water into the woman's face and beat her hands. She remained in blank unconsciousness. The maid was about to call for help, when, looking up, she saw that the door in the garden wall was open, and that immediately in front of it, and only a few paces distant, was the outer gate, one of its great doors pushed back against the wall. At a short distance outside the gate a stream of water trickled down the mountain-side, and where it fell into a big stone basin the maid saw

a barrel similar to the one which lay beside the unconscious woman. It was clear that she left one barrel to be filled while she brought the other to the garden. In a flash the maid saw an opportunity to escape. She went hastily to her mistress, and after a few hurried words of explanation returned to the peasant woman. Dragging her behind a tangle of rose-trees that hid all possible view from the castle windows, she stripped her of her clothes, and undressing herself, donned the unconscious woman's garments. The maid had some difficulty in strapping the heavy barrel on her shoulders, and its weight nearly bore her to the ground as she crossed the small space between the garden and the outer gate. But not a soul was stirring. A man wearing the cap of the Prince's livery was lying fast asleep on a stone bench in the gateway, but he did not stir as she passed him. When she got outside the gate the maid went straight to the basin, and, slipping the barrel from her shoulders, looked about her carefully. All view of the castle was shut out by a high wall and the tower. A rough road ran along the base of the mountain, disappearing after a short distance round a curve. She had quick eyes that maid, and saw that the road ended at the castle gateway. It was, therefore, the way that led to the outer world. She walked quietly to the curve in the road, then ran like a hare.

'One point in her story was of the utmost service to me. After the visit of the doctor, the necessaries he had ordered were sent from Naples, and were brought to the castle by mules. The police, therefore, provided me with a bundle of the various things which the maid said were generally sent to the Princess by the doctor, so that I could more easily enter the castle as a messenger from the Prince; for, although I was armed with the password, I should have been obliged to invent some reason for my going to the castle. The head of the police himself gave me a letter to the commandant of the *carabinieri*, who were stationed at a little hill-town some five miles from the castle, asking that all help I needed should be given me; and it was to this little town that I first made my way from the railway, with my two mules, one carrying myself and the other the important bundle.

'The commandant received me with civility, and that night I was lodged and entertained in the barracks of the *carabinieri*—I, Beppo Cavalanci, whom the *carabinieri* have so often cursed as the cause of long marches and weary watching! On the following morning I set out on foot, and after carefully inspecting the outside of the castle and the country round about it, I saw that even if I succeeded in getting the Princess through the gate, further escape was impossible. The track that led over the mountains to the town was strewn with boulders and broken with deep ruts; sometimes it was perilously steep. A lady like the Princess could not have walked a kilometre along it. The only chance of our reaching the town would be by means of the mules; and as we could only move slowly because of the roughness of the track, they would be useless in case we were pursued.

'"*Per Bacco*, Beppo Cavalanci!" I said to myself, "the head of the police has given you a truly hard nut to crack."

'I returned to the town, and late in the afternoon presented myself at the castle gateway with my mules. The great doors were closed, and I had hammered upon them with a stone for nearly ten minutes before any sign of life was vouchsafed to me.

'"What do you want?" said a voice above my head. Looking up, I saw a man leaning out of an opening in the tower above the gateway. He wore a blue-peaked cap, on the front of which was embroidered a Prince's coronet in silver—the Della Gravina livery. Above the edge of the opening peeped the muzzle of a carbine.

'"I am a friend," I answered; and I gave him not only the password, but also one of the signs of the Camorra. His look of suspicion instantly changed, and, with a friendly greeting, he disappeared. A few seconds later the great doors swung open, and I and my mules entered the courtyard. The castle, I found, stood at right angles to the gateway, and from one end of it jutted high walls enclosing an oblong space that occupied most of the vast area enclosed by the still higher outer walls. A low door in the inner wall, directly opposite to the entrance-gates, led me to the right conclusion that this space was the Princess's garden, and that it was through the low door the maid had escaped.

'The guard was filled with delight and friendliness. "*Per Bacco!*" he said, unstrapping the bundle from the mule's back, "we are in luck's way. Two comrades within a week! They must be giving the Princess a double allowance this time."

'I pricked up my ears, and feigning ignorance, I asked the man if the bundle was for the Princess.

'"Of a verity," he answered. "Such a bundle comes from Naples every three months. But one was brought by Alessandro Minelli a week ago. He left us only yesterday. It is strange they should send again so quickly."

'That was a narrow shave for me, signore! Alessandro Minelli was the head-porter at the Della Gravina palace. If we had met at the castle or on the road—well, the Prince would have been speedily informed of my whereabouts, and then——

'"Perhaps they have forgotten something," I said.

'"Perhaps; but what matter? It has brought

some company into this dog's hole of dullness. What a life! But my time is nearly up, and then for *bella Napoli.*"

'When one has been'—Cavalanci hesitated—'well, what I used to be, signore, one's wits become very sharp, and in a flash I saw that the arrival of a second bundle of necessaries for the Princess within a week of the other might arouse suspicion. I therefore took a grave risk for the future. I made a sign which showed that I was one of the Della Gravina household.

'If the man had any doubt or suspicion it instantly vanished, for he embraced me as if I were a long-lost friend, and stabling the mules, led me to a long, low room on the ground-floor of the castle, where four other men in the Della Gravina livery were eating their evening meal. They were delighted to welcome a fellow-servant, and in a few minutes we were laughing and talking as if we had known one another all our lives. That night, signore, I learnt all that I wanted to know.

'The castle was guarded by five of the Prince's men, four of whom spent six months there and six months at the Della Gravina palace in Naples, where they passed as porters. The fifth man remained always in Apulia. He was the steward, and had charge of the castle and the Princess, and it was from him that I gained my knowledge. Discontent and a nagging wife, signore, set the tongue wagging more freely than even bank-notes will.

'After the meal was over the steward took me to his own room, which was also on the ground-floor, and there, over a glass of wine, he told me all his troubles. He was married, but the Prince would allow no one to live in the castle save the four guards, himself, and the man and woman who waited upon the Princess and her maid, and cooked their food.

'"The Princess has a maid with her?" I asked in surprise. I could have bitten my tongue through with rage the moment after.

'The steward looked at me with sharp suspicion. "Why do you ask that?"

'"Only because I heard at the palace that the Princess was so violent that the doctors had been obliged to take her maid away."

'"When did you hear that?" His voice was still suspicious.

'"Oh, shortly after I entered the Prince's service," I answered indifferently.

'"Then you believe that the Princess is mad?"

'"So they all said," I answered innocently.

'"They say many things at the Della Gravina palace that are not true. The Princess has a maid."

'It was only afterwards, signore, that I discovered that the steward, the guards, and the man and woman who waited on the Princess had all kept the maid's escape a secret from the Prince. They dreaded his vengeance for their negligence. The doctor was easily silenced, because they threatened to denounce him secretly to the police for some other shady business which was well known to them, being, as they all were, members of the Camorra.

'That is an interruption,' said Cavalanci. 'Let us return to the steward. His wife, he said, lived in the small town five miles away, and made his life a burden by her ceaseless complaints of the dullness of the place, and because she saw him so seldom. He, too, was sick and weary of the long exile from Naples. "What is the use of high wages," he asked bitterly, "when there is nothing to spend them on? I have asked the Prince many times to let us go back to Naples; but he always refuses, and says he can trust no one else."

'"That is very flattering," I said.

'"But flattery won't stop my wife's tongue or prevent the children from growing up savages in that dog's hole of a town. You will see yourself when you come here that it is as bad as being buried alive."

'"When I come here?" I asked in surprise.

'"Yes; and you will be coming shortly. Didn't you know that every six months the porters at the palace come here, and the four men who are here take their place? You others, at any rate, have six months of Naples every year; but as for me, I might as well be dead."

'I learnt that the only duties of the four men were to guard the gate, which was supposed to be watched both by day and night. At first, it appeared, the rule had been strictly carried out, as if the men had been sentinels in an army; but gradually the watchfulness had relaxed.

'"What is the use of guarding day and night a door to which nobody ever comes except the doctor and a messenger once every three months?" said the steward. "It is a foolish waste of time."

'By skilful questioning I found that one man was always on guard throughout the day, each of the four taking it in turn, which meant that the castle was guarded by only one man, for the three others off duty spent their leisure in the town. One rule, however, was unbroken; the four men slept at the castle in a long room close to the gate. The steward was rarely absent by day, but he confessed to me that often towards nightfall he rode over the mountains to see his grumbling wife and savage children in the town, returning the next morning. And in answer to further questioning he told me that neither he nor any of the other men had ever seen the Princess. He had never been into the Princess's rooms, which occupied the whole of the first-floor of the castle, or into the garden. Locked doors prevented the unhappy lady from leaving either one or the other. The man and woman who attended upon her

were a married couple, and old servants of the Prince. They lived on the floor above the Princess, and had no communication with the steward outside domestic matters; the steward bought the food and other necessaries. He spoke of the couple with hatred, and added spitefully, "If the Prince wanted to get rid of his wife, he would have no difficulty with those two death's-heads so ready to do his bidding."

'I was given a bed in the long room near the gateway which served as a dormitory for the guards; and before falling asleep I learned another useful fact—the messengers from Naples generally stayed three or four days, sometimes a week, before returning. I had time, therefore, to make my plans.

'The following morning the steward took me over the castle. It was a vast building, with a great staircase in the centre. On the first-floor a big double doorway had been bricked up. The steward pointed to it significantly.

'"The Princess's apartments," he said. My heart sank, for this brickwork prevented all rescue of the Princess from the interior of the castle.

'On the second-floor the steward knocked at a double doorway exactly like the one bricked up below. It was opened by a woman, the most evil-looking woman I have ever seen in my life, signore. She was fat, and had little, pig's eyes.

'"Who is that?" she asked, looking at me suspiciously.

'"The comrade from Naples who brought the bundle yesterday," answered the steward.

'I made both the sign of the Camorra and the sign of the Della Gravina household, but I saw that she suspected me.

'"There is something strange about that box," she said. Her voice was hoarse and cracked. "There are many things in it that were not asked for, and things which were needed are not there. Why should it come within a week of the regular box, which contained everything on the list?"

'I laughed and shrugged my shoulders, saying as indifferently as I could, for I saw danger in the woman's suspicion, "How can I tell, signora? I obeyed orders."

'"Whose orders?"

'I was neatly trapped. Alessandro Minelli, the head-porter, gave the Prince's directions for their secret missions to the four *bravi*. But he himself had brought the regular box, and only a few days before! It was useless, therefore, to give his name.

'I took a bold step. "The orders of his Excellency the Prince to one of his servants are not often questioned by another servant," I said angrily. The woman gasped. "Not if the other servant is wise," I added.

'She blinked her pig's eyes at me, and, muttering something to the steward, stepped back into the room; he followed her, and she shut the door in my face. They were not happy, those few minutes I passed upon the big staircase, and when the door opened and the steward appeared, I looked anxiously at his face to see if the woman had made him as suspicious as herself.

'"What a polecat!" he said as we went down the staircase. "Just because there isn't a list in the box you brought, and because it came so soon after the other, she swears something is wrong, and wants me to telegraph to the Prince. I should like to see the Prince's face if I telegraphed questioning one of his orders. I told her to telegraph herself; but she can't write, and her husband is in a raging fever—which is a pity, as they might have got themselves into serious trouble, and I shouldn't be sorry for that. Those people are the bane of my life."

'"Obey! Ask no questions! were my directions when I joined the Prince's household," I said.

'"Yes; and you ask questions at your peril," he answered.

'The Fates were indeed fighting for the poor Princess and for Beppo Cavalanci. But for the husband's illness and the steward's hatred and jealousy of both the man and the woman, I should surely have been discovered.

'"They are never satisfied with anything," the steward went on. "It is grumble, grumble every morning. To-day it is quinine that must be fetched from the town, and the cistern must be filled in the Princess's garden. It is always *must!* These people have the authority. It is they who give the orders that I, the steward, if you please, must obey."

'Signore, did I not tell you the steward had a nagging wife? Those words showed me her tongue had made a wound in her husband's pride. I set my wits to work to inflame the wound.

'"Then you have to fetch the quinine and fill the cistern?" I said mockingly.

'His face grew crimson. "Well may you ask that!" he cried. "I am become the servant of servants! I do not fetch the quinine; I do not fill the cistern; but whenever it is filled, I, the steward, the representative of the Prince, must guard the gate—and by the order of these creatures! Was there ever such indignity?"

'"But why do you do it?" I asked with an air of surprise.

'"Well, ever since"—— he began, then stopped; adding hurriedly, "Whilst the cistern is being filled the outer gate and the gate of the Princess's garden both remain open. Extra care is, therefore, needed, and it is I who must give it."

'"Phew!" I said contemptuously; "when you have four men at your orders?"

'"That is what my wife says. But no, these people hold me personally responsible to the Prince for the gateway whilst this cistern is being filled. And to choose to-day, of all days! It is the birthday of my little girl, and we are making a *festa* for the child at my house in the town. I was going to ask you to honour us with your company. But now we cannot go. Oh, these creatures! They have done it out of spite!"

'I could have added to the steward's "Well, ever since"—— the words he just saved himself from saying; they were "the maid's escape." And from the fact that, angry and disappointed as he was because of missing the birthday-party, it did not seem to occur to him to suggest that the cistern could be filled on the following day, I judged that he did not dare to make such a proposal. There was no doubt but that the man and woman held the ill-guarded gateway on the day of the maid's escape as a perpetual menace over the steward. Their carelessness in leaving the door of the Princess's apartments unlocked could have had no consequences; the sleeping guard gave the maid her only chance of escape, and here the steward was wholly responsible. I concluded, therefore, that the couple insisted upon the steward himself guarding the gate when the cistern was being filled.'

(To be continued.)

RELICS OF THE GREAT DEPARTED.

OUTSIDE our many museums there must be thousands of priceless heirlooms and relics of the great departed in private hands. For all practical purposes these are as a sealed book to the general public, to whom they are unknown and inaccessible. A good deal of the pleasure in possessing such things is the ability to show them to others; but valuable relics in private hands can be seen by only a limited number of people. These remarks are suggested by a correspondent, Mr Cuthbert Becher Pigot, Temuka, Unthank Road, Norwich, who has been much interested in the article, 'A Memory of Olney,' by Mr Henry H. Brown, in *Chambers's Journal* for March 1911. What an excellent thing it would be, he says, if there were some sort of central bureau where the names of people possessing relics of the great departed could be registered! The difficulty, to begin with, might be to get the public to give the information. There is no doubt that such a register would be of the greatest value and interest to the world at large. The difficulty is how best to set about it. If some one with the requisite zeal, patience, and knowledge would begin to gather material which might be tabulated in volumes, as the Historical Manuscripts Commission is recording family papers, a useful register might be formed. The suggestion made by Mr Cuthbert Becher Pigot is that a scheme be set on foot for a Register of Relics in the possession of private individuals, with a central bureau known as the Relic Registry. Here a register would be kept of relics in the possession of private individuals, divided into various sections—Royalty, Parliamentary, Literary, Ecclesiastical, Army and Navy, and others.

We have an example of what may be gleaned in Mr Pigot's own family and connections, which shows what a wealth of material remains in private hands unknown to those who might be interested. Our correspondent's family in the past, on father's and mother's side, were especially rich in associations with literary people, and consequently possess many of their relics. His great-aunt, Elizabeth Bridget Pigot, and her brother were intimate with Lord Byron during his Southwell days. Moore, in his *Life of Byron*, writes of the amiable and intelligent family of the Pigots, who received the poet within their circle as one of themselves. In the Rev. John Becher, afterwards prebendary of Southwell, the poet found not only an acute critic but a sincere friend. The relics in the Pigot family include one or two locks of Byron's hair, a painted eye, and a life-size silhouette of him at the age of sixteen, the latter being interesting mementos of his features. Mr Pigot's great-aunt, Elizabeth Bridget Pigot, lived at Southwell, Notts, and it was at her house at Burgage that Byron gave his first promise of poetical genius. She encouraged his efforts and acted as his amanuensis. It is a tradition of the family that Byron offered her marriage. It is well known that she greatly admired him; perhaps it may be her admiration was too great to allow any such liking to stand in the way of the poet's career. A packet of Byron's letters was, at Miss Pigot's request, buried with her.

Than Hannah More few people in society one hundred years ago better deserve to be recalled and remembered. A friend of Garrick and Dr Johnson, she was a pioneer of Sunday schools and other philanthropic work in the Mendip district of Somersetshire; her tracts and booklets for the people sold in millions, and were the precursors of the London Religious Tract Society. She left some thirty thousand pounds of the fruits of her unwearied literary industry for the continuation of her good works. Mr E. A. Freeman, the historian, was proud to remember that she was a direct link between him and Samuel Johnson. He had been a pet of Hannah More, as she had been of Johnson. Macaulay, a fair, pretty child of four years, one day, when his parents were out, came to the door of his home to meet Hannah More, and precociously said if she

would come in he would give her a glass of old spirits! W. E. Gladstone was taken when a child to her residence, Barley Wood, Wrington, Somerset. The authoress took the future statesman aside and presented him with her *Sacred Dramas*, with his name inscribed on the book, and made a pretty speech, of which Mr Gladstone only remembered the beginning: 'As you have just come into the world, and I am going out of it,' &c.

Mr Pigot tells us that both his grandfather, Arthur Roberts, rector of Woodrising, Norfolk, and his great-grandfather, William Roberts, barrister-at-law, edited works on Hannah More. These were her *Memoirs; Mendip Annals, or, A Narrative of the Charitable Labours of Hannah More and Martha More in their Neighbourhood;* and *Letters of Hannah More to Zachary Macaulay*, father of the future historian. His great-aunts, the Misses Roberts, were intimate friends of this good lady, and doubtless it was through this friendship that various relics belonging to her came into the possession of his mother's family. Perhaps the most interesting of these is a collection of letters addressed to her from various celebrities of the day, with many of her own. In addition, the following relics are in the family: six silver dessert-spoons bearing her monogram; a lock of her hair; a large bronze tea-urn; engraved portrait of Hannah More, by H. W. Worthington (after Pickersgill, A.R.A.), with her autograph, 'Hannah More, 5th May 1824;' picture of her home at Barley Wood, underneath which is written, 'The place of my earthly abode for 23 years. Sept. 24th, 1824. Remember me.—Hannah More.' Also, a picture of the interior of her library there; and a memorandum-book, inscribed, 'Presented to my very dear Miss Roberts.—Hannah More.' Other relics are a seal and a charming miniature of her at about the age of seventy, said to have been done by Sir Joshua Reynolds.

Mr Pigot's aunt, Mrs Neville White, of Kirkley, near Lowestoft, who married a nephew of Henry Kirke White, has various books containing autograph letters and an oil portrait of the poet.

Further, an aunt of our correspondent has part of a skein of wool wound by the poet Cowper, and also impressions of the poet's three seals, showing his tame hares Puss, Tiney, and Bess. In addition to these, she has a letter of the poet, bearing neither date nor address, but apparently written at a time when he was suffering from the extreme melancholy and morbidity that finally ended in his death. Scribbled over the back of the letter are scraps of his translation of Homer. These were given to her father by Mrs Johnson, wife of Cowper's friend and kinsman, old Dr Johnson, known as 'Johnnie of Norfolk,' a relative of the poet, and much beloved by him. The present rector of Yaxham, the Rev. Cowper Johnson, is a grandson of Dr Johnson. Another relic of the poet is the stuffed dog Beau, which figures in 'Beau and the Water-Lily;' this belonged to the Rev. Arthur Roberts of Woodrising. It was a little brown-and-white spaniel in a glass case, with a water-lily in its mouth, and beginning to be moth-eaten. This was sold in 1886 on the death of Mr Roberts, and Mr Pigot is ignorant of its present possessor.

These are but a few examples in illustration of our subject, and indicate how great a field is open to any one with sufficient interest and leisure to follow up this fascinating pursuit.

A TRIP TO DICKENSTOWN.

In Dickenstown we find them, folk of Dickens' magic pen,
The Mutual Friends he gave us ere he passed beyond our ken;
We'll travel by the stage-coach just to spend a cheerful hour
At Todger's, or the Maypole, or perchance at Boffin's Bower.

In crowds they come to greet us and to drink a loyal toast:
Old Scrooge and Mr Pickwick, Trotty Veck and Marley's Ghost,
Agnes and 'child-wife' Dora, Mrs Gamp 'dispoged' for tea,
And Samivel still doubtful if he spells it with a 'we'!

Wot larx! here's Joe the blacksmith, and Micawber turns up too,
And Dolly Varden hand-in-hand with Dot so good and true;
In prunes and prism fashion Mrs General curtsies low,
While Mrs Jarley asks us to her famous Waxwork Show.

Then troops of children, grave or gay, around us weave their spell:
Sweet Floy and Little Em'ly, Jenny Wren and patient Nell;
Poor Jo the crossing-sweeper, and the boy who asked for more,
And Paul, and Tiny Tim without the crutch he used of yore.

Stand by! here's Captain Cuttle, and here's honest Cobbs the Boots,
And though, of course, no consequence, we welcome Mr Toots;
Here's Barkis willin' as of old, and Smike and Edwin Drood,
And Traddles with his 'dearest girl,' and Mark in jolly mood.

But now it's time we parted, so with jovial Dick we'll say,
'May friendship's wing ne'er moult a single feather in decay;'
And may we keep HIS memory green with love and fair renown
Who left us, for our heart's delight, those friends in Dickenstown!

THE MILITARY ESTABLISHMENT OF HIS HOLINESS THE POPE.

By G. PIGNATORRE.

THE most singular and striking body of trained soldiers serving under any potentate is that which garrisons the Pope's palace in Rome. From the silver-casqued Noble Guards, the Swiss Halberdiers in doublet and ruff, down to the Palatine Guards in shako and the Pontifical Gendarmes in bearskin, they form a distinctive feature of the Papal Court and a befitting setting to a medieval picture. Their gorgeous or quaint uniforms, glancing helms, flashing arms, glittering breastplates—like the black-velvet doublets, ruffs, and rapiers of the gentlemen-in-waiting—are in perfect artistic harmony with their surroundings, from which they receive and on which they bestow that correlative fitness which we instinctively feel on entering the precincts of the Vatican, although the presence of these troopers and foreign mercenaries, morally speaking, is an anomaly and an anachronism.

This singular little army of a spiritual potentate consists of noble Roman volunteers, burgher civic guards, and Italian or foreign mercenaries, and comprises four companies, differently armed, uniformed, and officered, and each possessing a distinct history of its own and a separate organisation.

First in dignity and antiquity come the Noble Guards, in their scarlet tunics, golden epaulets, and silver helmets. Raised in 1485 under the name of Light Horsemen, they were formed into two squadrons; and many years later, in 1555, their strength was increased by the addition of one hundred free-lances chosen exclusively from the scions of noble houses who could show a sufficient number of quarterings. The two corps were reorganised and united into one by Pope Pius the Seventh in 1801, when, after the stress and storm of the great French Revolution, he had righted the ship of St Peter. These noble guardsmen mount guard in the antechamber of his Holiness's private apartment, surround the *sedia gestatoria* on solemn fêtes, and escort the Pope when he drives out. They now number sixty-nine all told, under the command of a lieutenant-general.

The Swiss Guards, who rank next in precedence, were first enrolled by the fighting Pope Julius the Second; and subsequently, during the seventeenth and eighteenth centuries, three companies were added to the original one. After many vicissitudes, they were finally reduced to one company, which musters one hundred and twenty-two men of all ranks, commanded by a captain ranking as colonel. Of these, one hundred are privates or halberdiers. The officers and men on state occasions don their morions, breastplates, and pauldrons, the officers armed with partisans, the men with pole-axes; but when on guard and in undress the men are armed with ordinary modern rifles, though they still wear their medieval garb. The duties of these Switzers, who now play at soldiering, consist in standing on guard at the Grand Portal of the Vatican, and escorting the pontiff when he is borne, like some Eastern potentate, in his *sedia gestatoria* to celebrate High Mass, on which occasion, surrounded by his bodyguard, he is preceded by six halberdiers told off for this especial service, and armed with the formidable two-handed sword of their predecessors mentioned in Scott's *Anne of Geierstein*.

The other two corps of household troops—namely, the Palatine or Palace Guards and Pontifical Gendarmes—are far more modern, and do not possess the same stirring traditions. The first is merely an offshoot and a survival of the old Urban Militia or City Guard. They received their present formation and appellation in 1850, and are, as heretofore, recruited mainly from the burgher class of Rome. They are clad in a very becoming blue uniform, and wear shakos when in full dress, which, according to Lieutenant-General Tyrrel, is very similar to that of the French Republican Guard. The duties of the Palace Guards are very light. They are chiefly employed in Church ceremonies, conjointly with the gendarmes, to maintain order among the crowds who throng St Peter's on such occasions; and they are called out about once a month to drill or to mount guard. They number one hundred and seventy men of all ranks, and are all volunteers, providing their own uniform and receiving a small annual allowance for incidental expenses.

The Pontifical Gendarmerie—though last in precedence, by no means the least in appearance of the four pontifical corps—were raised in 1816

 [*All Rights Reserved.*]

to replace the French military police instituted by Napoleon the First, and, like the Irish military constabulary, were charged with the protection of persons and property throughout the whole Papal States. Reduced in numbers and duties, they now muster but ninety-six men and officers, and perform police duties within the Vatican at state ceremonies, as on the occasion of the present Pope's Jubilee, and act in conjunction with the Palatine Guards in keeping order within St Peter's. These gendarmes are all tall and strong men, every one being over six feet; and, in their bearskins and blue uniform trimmed profusely with silver lace, they are second only to the Noble Guards in splendour of equipment, and certainly foremost of all in their superb physique and perhaps in training, for many are old soldiers who have served their full term of service in the crack corps of the Italian army, the Royal Carbineers.

To the above-mentioned troops, who form the actual garrison of the Vatican, may be added the corps of firemen, who are organised on a military footing, wear helmets, and are dressed in a dark-blue uniform.

The grand total of all ranks aggregates about four hundred and sixty men, exclusive of the fire-brigade; and, as far as equipment, bearing, and drill go, they are unexcelled by any corps in any service to which they correspond. Nor have the two more ancient corps failed to show that, if holiday soldiers at present, they were once a hard-fighting force. The Noble Guards were slain almost to a man in the defence of Rome against the motley army of the Constable of Bourbon; and the Swiss Guards, who shared their fate, stood by their master again in 1849 against the insurgent mob of Rome as bravely as their forefathers had stood by Louis the Sixteenth in 1792, and only retired when they were commanded to do so by the Pope himself.

The presence of these superb household troops in the vast pile—the greatest in Christendom—also points a moral and tells a tale. They are skeletons of pre-existing corps, shadows, so to speak, of their former selves, like the temporal power of which they are the emblems—temporal power which, had it sprung from pure sources, had it even been wisely exercised in a worldly sense, could not but jar at times with the spiritual mission of the dual potentate, and finally become incompatible with the true national aspirations of the Italian nation. But how much more jarring, how much more incompatible, how impossible at last, had the co-existence of the two powers become when the clarion-call to freedom resounded throughout Italy, and sounded the knell of papal misrule and intolerance! Instances of this baneful influence of secular misgovernment are too numerous to quote; but the results afford positive proof that nowhere had the decline in population and wealth been more marked than in the environs of Rome and in Romagna, and that in few regions of Italy was public security more utterly neglected. Lastly, in no portion of Italy, outside the Calabrias, Sicily, and Basilicata, is illiteracy still so prevalent even after forty years of free schools.

Thus, on the first count of the indictment, we may quote as an example Ferrara, whose population, which during the sixteenth century amounted to one hundred thousand souls, had, according to Gregorovius, declined to less than thirty-five thousand since its annexation to the papal dominions in 1598. Crimes of violence were committed by high-born criminals with impunity, and by the low-born with little risk of punishment from the law if they took to the bush, becoming *uccelli di bosco* and swelling the ranks of the brigand bands who dwelt under the greenwood tree. Illiteracy, too, went hand in hand with crime; squalor completing the sorry picture which the so-called patrimony of St Peter presented for centuries.

Although the material advance within the last forty years has been very great, and population, manufactures, and industries of all kinds have increased, and many modern comforts been introduced, and, finally, organised brigandage has been suppressed, the moral decadence of a people brutalised and corrupted by the unceasing tyranny and misgovernment of many centuries has not been succeeded by a corresponding moral revival and educational development. Crimes of violence are almost as frequent as heretofore, the slight decrease in the long tale of assassinations being probably due to the extirpation of the banditti; while, according to the native press, fraudulent practices have actually increased. Illiteracy is still so prevalent among the Romans that nearly 50 per cent. of the population are unable to read or write. These discomforting statistics—which appeared in the returns of the census taken in 1901—continue to be substantially unchanged, and in their ominous figures indicate the durable and profound nature of the degradation wrought mainly by papal misgovernment.

I will conclude these brief remarks with the observation that, while æsthetically the gorgeous and picturesque appearance of the little garrison which keeps watch and ward at the Vatican is appropriate, the presence of these now purely holiday troops has never aroused in me that feeling of reverence or pity for the representatives of a lost cause which the Jacobite confederates or Napoleonic veterans have awakened. I have never felt anything but pleasure in contemplating these living pictures moving over the gloomy and stately background of the Vatican halls and courts; but without being in any way moved by the sight of their reduced numbers as contrasted with the myriads of armed men who marched under the banner of the Cross at the bidding of an Urban or Gregory, who, in his character of spiritual chief of Christendom, with sincere,

if at times mistaken zeal, preached crusades against the infidel and heretic. These mailed warriors of Western Europe were not the mercenaries of a temporal sovereign whose call to arms would summon them against Christians—nay, fellow-subjects—to uphold that sovereign's greed of power.

In this article I have only aimed at a brief sketch of this splendid body of household troops which garrisons the Vatican, and would refer my readers for fuller particulars to the pamphlet on the same subject written by Lieutenant-General Tyrrel, whose graphic and exhaustive account is well worth perusing.

THE CAHUSAC MYSTERY.

CHAPTER IV.—TOUCHING HANDS IN THE MEASURE.

LANCELEY was drunk—not objectionably so, not even visibly so to the eyes of women, only rather more boyish, more impulsive, more engagingly handsome, with a fleck of brilliant colour on his cheeks and a deeper light in his blue eyes.

It was Sunday night, and Fetterings was, as usual, rather more gay than during the week. The drawing-rooms and the great hall were well supplied with guests. Lanceley had been moving about talking to one woman or another until he anchored on a low, deep lounge by the side of Lorrie Madesson, whose little court of admirers gradually thinned away as they perceived that she meant to give Lanceley an innings. They knew, of course, that Wil Lanceley was not altogether a desirable companion in his present condition; but then Lorrie Madesson could take very good care of herself, as she had proved during the five years of her widowhood.

Lanceley, flung at ease, laid his arm along the cushioned cornice behind her shoulders, and bent nearer. The last man of her former entourage had, so to speak, evaporated by this time. 'Lorrie, I love you! I'm mad for you! Why won't you give me some sort of answer? I tell you this kind of thing drives a man to the devil!'

She looked at him over her shoulder with blue, mocking eyes. 'My dear child, I imagined you were one of those persons who had already arrived—in that sense.'

'Look here, what's the good of playing with me? Tell me at once and let me shoot myself, or—— Lorrie, I haven't any money, but I've decent connections; and, O Lord, I could make you so jolly happy! When I remember poor old Madesson, too, with his long face'——

'We will not bring "poor old Madesson"—I don't suppose he was a year older than you are, by the way—into this conversation, if you please.'

'Oh, all right. But you know what I mean, don't you? Why, I'd chuck the service'——

'You are not so much of a soldier that I need ask that sacrifice,' she put in with a laugh.

'Anyhow, we'd have an awfully good time all over the place.'

'Yes; I've money enough to carry you on for a little while,' she said with the tone of offering an ordinary remark.

He laughed; and without much caution as to whether the caress were seen or not, he touched her bare white shoulder with his fingers.

'The pot can't call the kettle black! These fellows here tell me you've been plunging since you came down to Fetterings. That's a good joke indeed! Come, if I play, you play too, darling. And, by Jove, I love you all the better for your pluck!'

'Thanks! That sounds encouraging. But I happen to know when to stop.'

He tried to search her face, but her profile told him nothing, while her beauty worked him into frenzy. 'See here, Lorrie; I swear I'll chuck play if only you will marry me. Darling—oh, hang it! no one is looking at us—darling, darling, darling! I swear to you—I mean it—I'm hanged if I won't chuck play for ever if you'll marry me! Heavens, if I could tell you what I feel! Lorrie, for mercy's sake, give me some sort of hope! I'll chuck play. Come, I swear I will!' He was bending down now so as to look up into her face.

Lady Madesson, though she usually kept her feelings well under control, felt the appeal of his personality. 'You are ready to chuck away a good many things for my sake to-night,' she said carelessly; but she smiled down into his eyes.

'I'd chuck away my soul for you; before Heaven, I would!' he stammered, aflame with hope. 'Lorrie'——

There was a little, deft movement on the woman's part, and a sound of jarred strings. Every one looked round.

'You have dropped my banjo, you stupid boy!' Lady Madesson was saying; and Lanceley found himself picking up something, he scarcely knew what; while a bewildered sense that but a moment before he had been alone with her surged through his mazed brain, mixed up with wonder as to where all the people he now saw staring at him had come from.

'Mr Lanceley is going to sing,' announced Lady Madesson.

This struck home to the young man's perceptions and to his mood. He would sing as he had never sung before. He supposed he was drunk,

he reflected light-headedly; but then he always sang best when he was drunk. That was one good thing. He would make her know now what it meant to be mad for love of a woman as he was for her. He would show all those laughing fools how to love. He would send them mad —mad as he was himself. He had done it before.

The lovely tenor swept through the rooms, wild, passionate, pathetic, pleading, maddening. People drew in from the other rooms to hear it.

'It makes me shake all over. I knew he sang; but this!' whispered a woman at the curtained arch to the man behind her.

'He's very drunk, and that's a fact,' replied the man with a low laugh.

In the farther drawing-room behind them were two people who kept their places. Both sat silent, and the rushing love-song sounded faint and sweet, more like some faintly stirring memory than any present reality. Cahusac, his hands clasped behind his head, listened, with his eyes on Alice Lanceley's face. Her physical likeness to her brother struck him afresh, though for the moment he chose to linger rather on the differences existing between them. Her head was bent a little, and, under the soft brown curls that fringed brow and ear and neck in some sweet old-fashioned style now once more in vogue, her features looked pale and set. The burden of life Wil dropped from his shoulders seemed to have fallen upon hers.

'He's very drunk, and that's a fact!' The gibing words floated to them across the quiet room.

She raised her eyes and met Cahusac's. She tried to smile, but he could see the tears. 'The world is badly arranged!' She spoke below her breath. 'The strong can meet misfortune—and—and temptation. But the weak and the gentle, who are easily influenced, should all have been born women. It would have been so much easier.'

'Have women no temptations?' Cahusac altered his position to hear her.

She caught the sudden dark look on his face. She had never seen it—at any rate, never more than the shadow of it—in all the years she had known him, and she faltered in her reply, 'We are sheltered.'

'More or less perhaps; but when the great moment comes, is not a woman the more unprepared? The weaker she is the more desperate will be the thing she does when driven into a corner. She may wreck a world, but naturally she does not stop to think of that!'

He spoke like a man with a bitter reason for his speech. She knew what every one else knew of his history, and the world added that he was of a cold and calculating nature. Society regarded him distinctively as a man of the world, engrossed by his ambitions; it credited him with a virile cleverness, and believed his air of indifference to be in some way a sign and guarantee of latent power.

Alice, who had been thrown with him frequently in her childhood, had never been persuaded of his callousness. 'I always used to think he felt things, and I am sure of it now,' she said to herself pityingly. She was very tender-hearted; apt to love those about her, she seemed to have been born with Wilford's share of the softer feelings as well as her own.

'A woman driven hard might do a desperate thing, but it would always be for those she loved, not against them! She could not ruin any one she loved.'

Cahusac's smile perplexed her. 'Most of all she will ruin those she loves if she lacks one supreme quality—staunchness. It is the rarest quality in the world, because it omits self in its calculations.' He caught a slight bewilderment in her face. 'But I shouldn't croak to you, Alice. The least we older folks can do is to leave you young ones to find out the creases in this poor old world for yourselves.'

She shook her head. 'You are not so much older than I am, Malcolm. You were at school with Wil; and as for him, I feel quite as old as he. Women are always much older than men, you know,' she said with her air of simple wisdom. It was never the matter of her speeches but the manner which told.

'Live for a smile,
And die for a kiss!
Glory to die at your feet for a kiss!'

Wil's passionate voice rang softly through the room.

Cahusac was reproaching himself. He had alluded to the past, which up to to-day he had held at arm's-length, never touching remotely upon it in speech, although it was the subject which most occupied his mind. His own words uttered in his own voice had the effect of a shock. He looked at his companion with a half-consciousness of having betrayed himself.

Alice was sitting with her chin resting on her hand; she was apparently full of some troubling reflection. In an instant his thoughts leaped from himself to her. 'Glory to die at your feet for a kiss!' It may have been the psychological moment. The common little refrain took upon it a transformed volume of meaning. The felicitous intensity of the rendering, the richness and passion of the voice which gave it a right of way to the world's heart, touched Cahusac too. With the song vibrating in his ears, he seemed to have gained a new sense of vision. As he looked at Alice a quick glow of interest, almost excitement, stirred him.

He was still watching her, noting the little chin, the pensive droop of her red lips, and even the turn of each soft curl upon her neck and brow, when she raised her long lashes slowly.

'I do not include you,' she began, evidently continuing their former conversation. 'I don't include you. You are older than Wil. I think you are older, because you have always been so sad.' Her eyes were large and blue—a clear turquoise blue, the very colour of truth.

Cahusac was silent from sheer astonishment. He sincerely hoped that he did not unconsciously pose before the world as an unhappy man! His face grew dark. 'I have never been accused of anything so sentimental before,' he said with a trace of derision in his tone.

'I—I beg your pardon,' she stammered in surprise. Her little speech had contained much more of sympathy than met the ear. How, then, had it offended him?

'Who has been telling you such an interesting fable about me?' he asked.

'No one; and it is not a fable. I have known it—a long time.'

'My dear Alice, some one has certainly been imposing upon your kindness of heart. Your pity makes an impostor of me.'

'No one ever told me you were sad,' she replied simply; 'but I have felt—not when you were a boy, but lately—that something very sad is always in your thoughts.'

'If that is the case,' he said with a slight smile, 'I am afraid you will very often be worried by other people's troubles which may, after all, you know, be as imaginary as mine.'

She looked distressed. 'I am sorry you are vexed,' she said after a pause for consideration. 'I will never speak of it again.'

Her adherence to her opinion in spite of his disclaimer, and her instinctive reading of him, disturbed him curiously. The cadence of the refrain reached them again, and translated itself into a living meaning. The girl flushed suddenly, while to Cahusac came a vivid and startling consciousness of her nearness.

Alice seemed to stand out in that moment from the crowd of people who had passed him during the last five years as dream-figures pass and fade, leaving no trace behind, no colour in the nooks of memory. Self-absorbed in the single purpose of his life, he had gazed, as one who sees dimly, upon those who came and went across his path, futile forms and unreal, far removed from the one point about which the dominant incentive of his life had drawn together and focussed the whole of active feeling. Practically dead outside that one idea, the unexpected contact of Alice Lanceley's words thrilled him. He awoke, as it were, and saw her.

Clearly defined against a massed background of shadows he saw her, not her physical perfections only, but the clear soul of the girl, young, untried, and simple. She was sweet and pure, with quick womanly sympathies — thank God there are many such!—but to Cahusac, seen in the light that never was on sea or land, she seemed far, far more. He did not forecast what was coming, nor how near was the day of action and storm and broken sunshine; but always, in looking back, Alice, with that delicate flush mounting in her cheeks, personified the dawn to him—the dawn of a troubled day, but, after all, *the* day of his life.

(To be continued.)

THE TEMPORARY HOUSES OF PARLIAMENT.

IN the volume of this *Journal* for 1910 there was an interesting article on the burning of the old Houses of Parliament in 1834; and as it was not until many years afterwards that the new Houses, as we have them now, were ready for occupation by the Lords and Commons, the question arose in the minds of many readers as to where these Lords and Commons sat and conducted their deliberations and made their laws in the meantime. And having asked themselves the question, they did in some cases make efforts to get the answer, and consulted various histories and works of reference, but with no satisfactory result; and it came about that in the end they wrote here to Edinburgh to tell of their trouble and their failure, and to solicit help in the satisfaction of their justifiable curiosity.

They were quite right. It was eleven years before the Lords took occupation of the new House that was built for them, whilst the Commons did not establish themselves in their new quarters until five years later; and really the long period of twenty-four years elapsed after that terrible conflagration before it could be said of the new Palace of Westminster that, with its decorations, towers, and everything, it was properly finished, and there was no more to do except keep it clean and nice.

But Parliament had to sit, even if it had only an old oak-tree to sit under, as in the earliest times of village gatherings in Britain. Temporary Houses were made for it to sit in, and they were necessarily made in a great hurry, but much money was spent on them; and if they were inconvenient, incommodious, and poor things at their best, when you consider the requirements and the claims of British legislators, they were nevertheless good makeshifts, and as a subject of occasional interest in these later times they were all the better for being what they were. But it is the fact that if you consult histories, books of description, and the like, you will find some fine descriptions of the great fire, and, following them, some good accounts of the new buildings which we now have, and which were not ready until many years had elapsed, but

little or nothing—and generally it is absolutely nothing—about the home of the great Mother of Parliaments during this intervening period. In his attempt to give satisfaction to those who are curious in the matter, and to write a small but important chapter in the history of the fabric of Westminster, the present writer has had to go back to the contemporary records and get the facts from them. The results, especially in the matter of the resurrection of some old discussions and controversies, have been interesting, as shall be briefly shown.

First, however, I would like to supplement the very interesting paper already referred to by adding a comment and a few quotations. The writer refers to the inquiry that was instituted by the Privy Council into the statement made by the man Cooper that news of the fire reached the Bush Inn at Dudley, more than a hundred miles from London, within three hours of the breaking out of the conflagration. Cooper said it was being talked about in the inn, at which he was himself staying, and his statement caused the gravest perturbation until, after he had been closely cross-examined by the Lord Chancellor and others, it was realised that he must have been mistaken. The point, of course, was that, as there were no railways and telegraphs in those days, it was impossible for the news to have got there in the ordinary way so soon after the outbreak; and if the fire really was talked about at Dudley at the hour mentioned by Cooper, then somebody there must have known about it beforehand, in which case the fire must have been not the result of an accident, but of a plot of incendiaries. The simple comment I wish to make—an obvious one, but still better not left unmade—is upon the difficulty that most people at the present time will have in bringing their imagination to the point of realising this fact, that it was absolutely impossible for the terrible news to have travelled a hundred miles in three hours, absolutely impossible, and that the people at that distance must therefore have been ignorant of the fire. This revival of an old episode is made simultaneously with the most amazing achievements of wireless telegraphy, by which it is made to appear that for the future, when necessary, anybody in the world, whether on sea or land, may know of the happening of something at practically the time of its occurrence. News is simultaneous all over the world. Think, then, of 1834, and ponder!

The quotations referred to have reference simply to the observations of some bystanders watching the Houses of Parliament being burned to the ground, as they were reported at the time. One old gentleman hired a chaise and drove down to Westminster to see the great blaze, and on arrival there he asked the cabman if he had any information as to the cause of the sad disaster. 'Why, yes, sir,' was the answer. 'Some says as it has been done by the builders to make a job for themselves; and I did hear, too, as how it was Mr Hume as set 'em on, 'cause, you see, sir, the members would not build a new House, though Mr Hume has asked 'em so many times to do that, and told 'em how very uncomfortable it was in the old un.' Then a coalheaver in a garrulous mood attempted to pass the soldiers standing at the end of Abingdon Street in order to get into the Old Palace Yard. Of course he was stopped; and after some disputation he said, 'Vell then, my fine lobster, so you really means for to say as you won't by no manner of means let me go and see my own property burning?' The soldier made some sarcastic remark about the man's claim to possession of the burning Houses; whereupon the fellow added, 'Yes, Mr Impurrence, my own property; and if you knowed anything vatsomedever about the liberty of the subject, there 'd be no call for me ever to tell you as they 'll lay a tax upon me for to help to build it up again; but you are nothing but a soldier, and don't pay no taxes.' And so he walked away. Finally, in the way of these preliminaries, the reports of the fire in two of the chief newspapers of the period, the *Times* and the *Morning Post*, bore only one single headline to them, and even that was in type no larger than that at the top of this page. Yes, indeed, *tempora mutantur!*

The very first place that was seriously mentioned and considered as a temporary home for Parliament was—Buckingham Palace! The circumstances were not a little curious, and the remembrance of them now, in view of the criticism that has lately been cast upon that national edifice, is entertaining. Our present King George had no sooner succeeded to the throne than what might be called an agitation was got up and very vigorously prosecuted in favour of demolishing this London residence of royalty, and building in its stead something rather more beautiful and imposing, something more worthy of the nation, and better fitted for the ruler of the greatest empire the world has known; or, if total demolition were considered too much, then a fairly full reconstruction, an improvement of the front, and a general heightening. The palace was very vigorously decried for its architectural imperfections both inside and out; and in the end it was determined to do something to it, and to spend a fair amount of money in doing it, but it was not considered practicable to pull the palace down entirely.

Now in those later pre-Victorian days they evidently thought a great deal of this palace; and we must give some special credit to William the Fourth that, in his artistic enlightenment, he evidently did not, and so to a considerable extent was in advance of his time. This being the situation, what happened was quite funny. No sooner had King William come by the news that the Houses of Parliament were destroyed

than it flashed through his mind that here was a way of getting rid of Buckingham Palace; and as soon as it was decent he made haste to offer it for the purpose of being made Parliament's temporary home. In the name of the people the Press thanked him exceedingly; said it was really too kind of him, but they could not think of depriving him of the palace; and for their part thought that, if it were all the same to His Majesty, St James's, which was much smaller, would do quite as well. Then the king said he could not give them St James's, as he required it for his own use, but really must insist that Parliament should take Buckingham Palace—it would be pleasing to him if they did; and then the answer had to be given to him that they would not take the palace, and were sorry to realise that His Majesty evidently thought so little of that beautiful place. To be exact, when the king made the first offer, the *Times*, in gently discountenancing it, observed that His Majesty was always liberal and considerate towards the country, and then went on to say that the old palace of St James's contained apartments fitted for the reception of a large number of persons, but did not afford suitable house-room for the various departments of the royal family, and suggested, therefore, that His Majesty should still apply to his own use the palace of Buckingham House and turn over the old pile of St James's to the now unhoused legislature. Failing this, the journal mentioned that Somerset House and Westminster Hall were possible alternatives. It even hinted that a club-house with some sufficient sitting-room might answer the wants of the House of Commons. Had such a suggestion been adopted, one supposes that when the Whigs were in power they would have insisted on Parliament meeting at a Whig club-house, while when the Tories were in office naturally a Tory club would be favoured. It was a startling idea.

When, in consequence of the persistence of the king in his endeavour to get Parliament to take possession of the palace, the *Times* found it necessary to put its foot down, it stated its views in a leading article thus: 'His Majesty has the best possible right to refuse St James's Palace for the emergency which has arisen, with whatever earnestness it may have been solicited by his Ministers; but, on the other hand, the country has an equal right to say, "We have need of Buckingham Palace for the town residence of the monarch; and, sincerely and cordially as every honest man must wish to see the life of our respected sovereign prolonged, it would be foolish to forget that he will in the course of nature have successors to whom Buckingham Palace may prove less distasteful than to his present Majesty, *if it be* the fact that *King William* really dislikes the place, which *is such a costly* record of the munificence of *England and* of her desire to accommodate and even indulge the Crown."' This was distinctly nasty.

However, the matter was very quickly determined. As a temporary home for Parliament had to be found, and very likely would have to serve for some years, it was decided to make as good a one as possible, and to spend some money on it. Parliament had to meet once soon after it became homeless in order to get itself further prorogued, and the Library of the House of Lords was fitted up for the ceremony, with a temporary throne, woolsack, and other important details, while the Commons met in an adjacent committee-room.

There, cramped for space, huddled up, suffering many inconveniences despite the thirty thousand pounds that had been spent, the two Houses sat for many years—far longer than they had ever dreamt of doing; and there must often have been times when some of the legislators remembered a little regretfully that they might have had Buckingham Palace if they had so desired.

The Speaker's chair was similar to the one in the old House, and was designed by Sir Christopher Wren, but by a strange anachronism this chair was represented in the celebrated picture of Oliver Cromwell commanding the 'bauble' to be removed. In the new home of the Commons, as in the Lords, there was a gallery behind the chair, a part of which was allotted to the Press. There were eight or nine rows of seats on each side of the House, and cross benches at the end of it, the two back rows being set apart for the use of peers and peers' sons, while there were also a few seats near the Speaker's chair for the use of privileged persons. There was accommodation for five hundred members, and at the back of each seat was a little bronze clip to which the member who had secured the seat might fix his card instead of fastening it with a wafer, as he had been in the habit of doing in the old House. The House was heated by a steam apparatus, the heat ascending through a large grating in the middle of the floor. The Library closely resembled the old one, and was situated over what had constituted the Long Gallery. The chief fault of the whole arrangement was the great deficiency of offices and committee-rooms. There were very few of these within the precincts of the House, with the result that the staff were scattered all over Westminster in offices and private houses that were taken for their accommodation, committee-rooms being also fixed up in these premises. Such houses and offices were taken in Great George Street, Parliament Street, Abingdon Street, and elsewhere, and so the human works of Parliament were spread over a large area and were wide apart from each other. It was a very inconvenient arrangement, but nothing better could be done.

A few words concerning the building of the new permanent Houses of Parliament as we have them now will round off the story. At first there

was an idea that it would be well to include in the new scheme as much as possible of what was left of the old Houses; but the conclusion was ultimately arrived at that this would make a patchwork affair, and would not prove satisfactory. A select committee was appointed to consider what was best to be done, and it reported that the design for the new Houses should be a matter of open competition, that the Government should appoint five commissioners to examine the plans that were sent in, that not less than three or more than five should be selected, that four premiums of five hundred pounds should be paid to the architects of the four most favoured, and that the architect receiving the first premium should be employed unless there were some very strong reason for not taking this course, in which case he should be given a premium of one thousand pounds. No fewer than ninety-seven architects sent in their plans, the only restriction that had been placed upon them being that the character of the design should be either Gothic or Elizabethan.

Four months after they were sent in it was announced that the plans of Mr Charles Barry, who had designed the Travellers' Club, the Reform Club, and some other notable buildings, had been accepted; but the architect was requested to agree to a condition that from time to time, as the work developed, he would submit his schemes and drawings to competent judges of their effect, 'lest through over-confidence, negligence, or inattention in the execution of the work we fail to obtain that result to which our just expectations have been raised.' Mr Barry accepted the conditions, being naturally much elated at his success; but his brother-architects blamed him for doing so. He had a very unhappy time afterwards; and, if the building of the Houses of Parliament brought him great and lasting distinction, it gave him no pleasure, but considerably embittered the rest of his life. All the disappointed architects were jealous, and at a meeting that was held after the competitive designs had been exhibited in Westminster Hall it was decided to petition Parliament to set aside the award on the ground that in the accepted design considerations of expense and the conditions of the competition had been disregarded. Sir Robert Peel, however, pointed out grave reasons why nothing of the kind should be done, and a little while later twelve of the disappointed competitors made a joint protest against the attacks that were made upon Mr Barry, and so they soon ceased.

It took nearly three years to make the river-wall and construct sound foundations, and towards the end of April 1840 the first stone was laid, with nothing in the way of ceremony and only passing public notice. Thereafter Barry was very considerably hampered by the interference of Parliament and officials whom it appointed. Naturally the architect resented such interference, but still it has to be remembered that the work was a gigantic one and of enormous importance. First a doctor was appointed to superintend the ventilating and warming arrangements; and then, after Barry had changed his plans without authority in order to gain more accommodation, a commission was appointed to superintend the completion of the work. As already stated, the Lords were able to take possession of their new House in 1847; and five years later Queen Victoria made her first public entrance into the new buildings, and Barry received the honour of knighthood. He died eight years later, and was buried in Westminster Abbey.

There was another rather unseemly wrangle as to whether the architect should be paid a lump sum for his work, as the Government wished to do, or whether he should receive a commission on the outlay, as he demanded, in accordance with professional custom. The cost was vastly more than the original estimate of seven hundred and seven thousand one hundred and four pounds. In 1850, when much still remained to be done, a parliamentary paper was issued which showed that up to then no less a sum than one million nine hundred and ninety-seven thousand two hundred and forty-six pounds had been spent on the work, and that at least another half-million would be needed for its completion. It must be remembered, however, that considerable additions had of necessity to be made to the original design, and that these were forced on the architect. Again, the cost of the furniture, fittings, and decorations, which was not provided for in the original estimate, came to about half a million. For all this some censure was laid on the architect. It might be added that hard magnesian limestone which was quarried at Anston in Yorkshire was employed for the exterior of the buildings, and Caen stone for the inside. One of the architects who was called in to assist Barry in his work was Augustus Welby Pugin, who was a great authority on Gothic architecture, and some time after both he and Barry had been dead it was asserted on his behalf that he was the real architect of the Houses of Parliament. But at this time of day we need not concern ourselves with the details of the controversy. Barry's original design was departed from in some important features, and he had certain schemes for additions to it which were never fulfilled.

THE BANDIT AND THE LADY.

CHAPTER IV.

'HE was a good-natured fellow this steward, for at the midday meal he told the guard who was on duty for the day that he would take his place at the gate, and that he could join the other three, who were all going to the child's birthday *festa*. The man accepted gratefully. "You will have plenty of company into the town," the steward said to me.

'"But I thought you and I were to go together at sundown," I answered. This plan did not please me at all.

'"There will be much fun at the *festa*," he answered. "Why should you miss it by staying in this dull hole? No; go with our friends here, and enjoy yourself!"

'I thought quickly. Was it good-nature, or a suspicion planted by the ugly woman on the upper floor, that prompted the desire that I should be absent at the *festa* whilst the door of the Princess's garden was open? It was wiser to take it as good-nature. Therefore I made the steward many compliments, protesting that I was like a frog in a jeweller's shop at all *feste*, and should much prefer to spend the afternoon in his company.

'He was flattered, but still protested. "If I go this afternoon I shall see nothing of the signora," I said, remembering that the lady had a tongue. "She will be so busy with her guests. I can go with you to-morrow."

'The steward's eyes opened wide. "I had forgotten that, and Maria would never forgive me if she missed a good gossip with a comrade in the household who has just come from Naples," he answered.

'I think it was the knowledge of the use to which his Maria would put her tongue if she missed a good gossip in her dull life that determined the steward.

'When that afternoon was over, signore, how I rejoiced in my heart that the steward was jealous of the man and woman who waited on the Princess, and that he had a nagging wife! But for these two facts the Princess della Gravina would still be a prisoner in the castle and I should be in prison.

'When the four men had gone the steward and I went to the gateway. A peasant woman was sitting upon the stone bench with what looked like harness upon her shoulders. The steward greeted her, and unlocking the great doors, set one of them back to the wall. I then saw the rivulet coming down the mountain-side opposite the castle-gate and falling into a stone basin, as described by the maid. Two high wooden stoups stood upon the edge of the basin, and one placed immediately beneath the rivulet was overflowing with water. The peasant woman crossed to the basin, and with a deft movement raised the full stoup and fixed it into two loops in the harness on her back, placing the empty stoup beneath the rivulet. Then supporting the bottom of the stoup upon her crossed hands, she walked with a steady, gliding motion through the gateway and across the short space of court-yard to the door in the high wall of the garden.

'"Oh, but you are very quick in beginning to-day!" cried the steward. "Wait a moment whilst I unlock the door."

'In the wall just above his head was a small wooden cupboard, which he opened. Within I saw a row of keys, some small, some big, each hanging on a separate nail; but I could not see the position of the key which the steward took out. I noticed, however, that although the cupboard had a lock, it had no key. He went to the gate in the wall, thrust the key into the lock, turned it, and then pulled at the door. But it remained fixed.

'"Ah, that woman! that woman!" cried the steward in a fury. "She has done this to spite me! There are two locks on this door, one upon the outside, and one upon the inside. She has the key of the inside lock, and has not taken the trouble to come down and unfasten it. No; it is I who must mount all those stairs to say the water-carrier is here, and will she, in her graciousness, descend and unlock the door upon her side? *Per Bacco*, it is enough to try the patience of a leaden saint!" And muttering curses and angry oaths, the steward ran towards the castle.

'The key was in the lock. There was nothing about the handle to distinguish it from any other key. I looked at the peasant woman. She seemed stupid; but I made a pretence of trying to turn the key. Then I pulled it out. It was long and thin, with curiously shaped wards—a key that I should recognise immediately if by any good fortune I could get at that cupboard. Presently I heard sounds on the other side of the door, and thinking it advisable that the woman should not see me, I slipped round the angle of the wall; and when the steward returned, hot and panting, I was in the dormitory close to the gatehouse.

'Presently I joined him on the stone bench in the gateway. He was fuming with rage, muttering and grumbling. I paid little attention, however, to what he was saying, as I was wondering, with a sinking heart, how I could possibly reach the Princess. The second lock upon the garden side of the door made the easiness with which I could get possession of the key of the outer lock a bitter mockery. I was in despair.

'From where we sat one could see a mass of flowers through the little door.

'"It must be a beautiful garden," I said. "Look at all those flowers."

'"Beautiful or not," answered the steward, "that is all I have ever seen of it."

'I pretended amazement. "You, the steward! You, who have charge of the whole castle, have never been in the garden! But it sounds incredible!"

'It only needed these words to set him raging. Yes, it was incredible, he declared; but there were orders, and they must be obeyed.

'Suddenly the steward struck his hands sharply together. "*Corpo di Bacco!*" he cried, "now I come to think of it, the order never came from the Prince. It was given me by the doctor."

'"His Excellency always gives his orders direct," I said meaningly. "Is the doctor of higher authority than the steward?"

'My only hope was to get inside the garden. There was the open door before me, and by my side a discontented, jealous man; therefore I added, "Perhaps the doctor also has to obey those two people. It may be that in obeying him by never entering the garden you are only obeying them."

'"Do you think that is possible?" he asked eagerly.

'"I judge only from what you yourself have told me of the way this man and woman treat you. They may have some reason for not wishing you to go into the garden. Even they would scarcely have the impudence to order the steward, who is responsible to the Prince for the whole castle, never to enter one particular part of it; so you get the order from the doctor."

'"They can make the doctor do anything they wish," he muttered.

'"Ah! that is the explanation." Then for a little while I kept silence, letting my words work in the steward's mind.

'"The door is open," I said at length. "You are the steward; why don't you assert your authority over that man and woman, and go into the garden?"

'He looked at me doubtfully, half-rose from the seat, then sat down again.

'Again I pretended amazement. "Is it possible," I asked, opening my eyes as wide as they would stretch—"is it possible that a fine fellow like you is afraid? No wonder these people treat you so scurvily!"

'Signore, in an instant the man was on his feet. "I am the steward!" he hissed. "I will go into the garden!"

'"Bravo! bravo!" I answered back. "Show them who has the real authority."

'"And you will come with me to show those two children of the Evil One that not only do I go into the garden, but that I take with me whom I choose."

'My heart was beating with excitement, but I deemed it wise to show no eagerness, rather to hang back. Men so easily persuaded as the steward are apt to be suspicious. It was, therefore, as an unwilling visitor that I followed him through the little door.

'The garden was truly beautiful, but my eyes saw nothing beyond the stone staircase at the end, which I knew was the only entrance to the Princess's apartments, and as I looked I could have leapt for joy. The upper part of the door that opened upon the staircase was of glass! We walked all over the garden, the steward growing more and more pleased with himself because of this show of authority; but for fear of exciting his suspicions I paid little attention to the row of jalousied windows on the first and second floors of the castle, and I asked no questions.

'The garden was a bower of flowers; there was not a weed anywhere. It was an oasis of beauty in that dull and dreary place.

'"Whenever the cistern is filled I shall come here," said the steward, sniffing at the heavily scented air. "It will be pleasanter to watch the water-carrier from this garden than from the hard stone seat in the gateway. *Supristi!* What is the matter with the woman?"

'The water-carrier was standing in the doorway beckoning to us.

'We hurried to the door, and there found the cause of her beckoning. A small boy, all rags and tatters, was standing in the gateway. He gave a letter to the steward. The man frowned and bit his lip as he read it; then he turned to me.

'"It is from my wife," he said; "she is heart-broken because I am missing the child's *festa*. Listen to what she says: 'It is a slight put upon me before all the town and by those two fiends. They knew it was the child's *festa;* that is why the cistern is being filled to-day. But if you are a man you will not let this slight be put upon me. I hear that one of the porters from Naples is at the castle. Why should not he keep the gate, and you be here in your proper place with your wife and children? If you don't come you will be the laughing-stock of the whole town, oh steward of the castle who must watch a gate by order of a madwoman's keepers!'"

'The steward trembled with fury. "Every word she says is true!" he cried. "They mock me already in the town, but it is because of her clattering tongue."

'"You had better go now," I urged, "or your wife's tongue will do you more harm still. I will gladly watch the gate."

'His protests were only half-hearted, and in a little while he was ready to start, spick-and-span in his best clothes. My duties were simple. The water-carrier would tell me when

the cistern was filled; I was then to lock the garden-door and hang the key on an empty nail which the steward showed me in the little cupboard in the gateway. Then I was to close the great outer doors, lock the three big spring-locks which fastened them, and put up two iron bars. Truly not a hard afternoon's work.

'The steward waved his hand in farewell as his mule turned the corner of the curve, and I was left in charge of the castle and the Princess.

'I sat for some time on the stone bench, thinking, thinking, the water-carrier passing to and fro as regularly as the pendulum of a clock, and as I thought my plan came to me in a flash.'

'What was it?' Tredare asked eagerly.

'The signore shall have the story as it goes,' Cavalanci answered.

'I remembered the maid had said that the Princess watered her flowers herself. Now, standing by the side of the cistern I had seen a small watering-pot such as ladies use. I had come prepared with many things that might help me in rescuing the Princess, but pencil and paper were not among them. However, these were quickly found in the steward's room. I wrote: "Most Illustrious Lady, there is one here to set you free. Be ready to-morrow at midnight, and wait until two o'clock. If I come not to-morrow, be ready the next night. If I come not then, you will know that I have failed. It will help your servitor if you will wait at the door leading to the garden-stair. Place a stone in this envelope and throw it over the wall by the garden-door. Your servitor will know by this that you will be prepared."

'It was risking being seen by the woman to enter that garden again, but there was no help for it, and taking the moment when the water-carrier was on her way to the basin, I slipped through the door. The cistern was hidden by a hedge of tall flowers, and, crouching behind them, I slipped my letter under the watering-can, then returned swiftly to the stone seat in the gateway.

'It still wanted an hour to sundown when the water-carrier told me that the cistern was filled. I have told the signore that the garden-door opened towards the gateway. It opened so far back, indeed, that any one attending to the lock on the inner side could not be seen either from the castle or the garden. Signore, directly the peasant had gone I attended to that lock. I destroyed the wards in such a manner that the key would turn but the hasp would not move. There is a drawback,' he added, with a smile, 'in having two locks on opposite sides of a door; you can never tell which of them is keeping the door fast. I likewise thoroughly oiled the lock upon the outer side of the door. Then I performed the duties allotted to me, locking the door upon my side and hanging the key in the cupboard, afterwards closing the great doors with a clang and a rattle that must have been heard all over the castle.

'But the creaking and noise made by the keys of the spring-locks disturbed me. The sound of one of them being turned would be enough to wake the four men sleeping in the dormitory near by, and there were three locks! *Ma che!* but I had a busy time oiling them, and trying to see how noiselessly I could turn them. I had just found that by gripping the keys in a certain way the locks rolled back with scarcely a sound, when I heard a soft thud on the cobble-stones of the courtyard. I turned, and, lo! close to the garden-door lay something white—my envelope, signore. There was no writing upon it, but besides the stone it contained some flowers. I was filled with joy—the Princess had got my letter, and this was her answer.

'The steward and the guards returned late, all of them tired and sleepy from the effects of the wine they had drunk at the *festa*. But the steward was not too sleepy to express his gratitude to me, and say that his wife insisted on my paying a visit to her the next day so that she might thank me herself.

'The next morning, accordingly, the steward and I set off for the town. He was filled with delight because of the double snubbing he had given "those people."

'"It has done good already," he said. "I told the wolf-cat this morning that I had walked in the garden, and that I had set you to guard the gate yesterday. And I told her that in future she must remember I am master here. She was as humble as dirt. I shall have no more trouble there, I fancy." The steward stuck out his chest and squared his shoulders. No man was ever more pleased with himself.

'His wife was what I expected to find, a complaining, discontented shrew, and it was her bad temper that decided the night of my attempt.

'There was to be a *festa* at the house of the mayor the following night, to which the steward and his wife had been bidden. During the midday meal the steward said he should not go to this party; the mayor gave himself airs, and he for one was not going to be patronised by the fellow. Instantly there arose a clamour and a clatter enough to make the roof fall in. Oh, that woman's tongue! She stormed, she shouted, she nagged, until for the sake of quiet the steward said he would go. For myself I welcomed the woman's ill-temper, since it meant that the steward would be away from the castle during the next night.

'On the pretence of making arrangements for my return journey to Naples, I got a little time to myself, which I used in a secret visit to the commandant of the *carabinieri*. He gladly promised that four mounted men with two

spare horses should be in waiting the next night near the castle, and he also procured for me some stiff paper, a small bottle of paste, and a glass-cutter such as plumbers use.

'I slept most of the following day, so that I might be fresh and prepared for the work of the night. The steward went off to his *festa* early in the evening, and seizing a moment when I was alone in the dormitory, I changed the key from the inside of the door to the outside. Shortly before ten o'clock I complained of being tired and went to bed, but I did not undress, only taking my boots off. One by one the four guards followed me, and by eleven o'clock snores and heavy breathing told me that they were fast asleep. *Ma che!* that hour of waiting! It seemed as long as a whole day.

'At last midnight struck on the great clock of the castle. I crept from the dormitory, my boots in my hand. The key grated loudly in the lock as I turned it. In the intense stillness it seemed as loud as the report of a pistol. I listened anxiously, but nothing stirred outside. To take the key of the garden-door from the cupboard and steal quietly across the courtyard was the work of a few minutes. The door opened without a sound—my work on the wards of the inner lock had been most successful; but as I was creeping up the path that led to the staircase the moon burst from behind a cloud and shone full down on the castle and garden. There was not a particle of shade anywhere. I hesitated for a moment, wondering whether it would not be better to retreat and wait for the clouds to hide the moon; but I reflected that if any one were watching the garden I must have been seen, and that at any rate the Princess must have seen me. Therefore I hurried swiftly forward and up the stone staircase to the door, my stockinged feet making no noise.

'There was no shutter—which I had feared I should find—behind the glass that filled the upper part of the door. I peered through it, but all was darkness within. I tapped softly, and out of the blackness on the other side appeared a finger, which was pressed upon the glass, and gradually I made out a shrouded figure standing at the right of the door.'

(To be continued.)

LIFE AS A WIRELESS TELEGRAPHIST.

TEN or twelve years ago the only wireless telegraphists in existence were a few scientific experts and their assistants; but when wireless telegraphy came into practical operation for commercial and other purposes the wireless telegraphist, as a natural result, came into existence, and many like myself who were preparing for service in some of the big cable companies elected to try their fortunes as wireless telegraphists, for whom a very considerable demand had arisen.

My first experience as a wireless operator was on board a liner. I had gone through a short period of training in wireless work, which, together with my previously acquired knowledge of ordinary telegraphy, was supposed to render me thoroughly competent for any duties; but this, I fear, was only a supposition. A great deal of practical experience in wireless work is required before one becomes a really efficient operator. The fact is, a wireless telegraphist is always to a certain extent, even now, working in the dark. He is in control of an apparatus that behaves from time to time in the most eccentric fashion, sadly puzzling even to scientific experts, and simply bewildering to an operator. In cable-work, when anything goes wrong with a receiver or transmitter, an operator who has been properly trained in his duties can readily enough ascertain the cause of the trouble and put it right. In working a wireless apparatus he has often simply to guess at the cause when trouble arises; sometimes he guesses right, and sometimes he does not. I remember the first night I was on duty the captain of the liner wanted to signal another vessel which he knew ought then to be within about fifty miles of him, bound for Southampton. In accordance with his orders, I signalled her, but our receiver did not record a reply, which showed that (presuming that the liner was where we expected her to be, which she very likely was) either her apparatus or ours was faulty. I could not, however, be certain that ours was all right without testing it in various ways; and whilst I was so employed a message suddenly began to come through. The captain was standing beside me in the operating cabin at the moment, and exclaimed, 'There they are! We have got them at last.' But we hadn't. I had got our receiver into 'tune' with the transmitter on board a steamer some miles away, which was carrying an experimental wireless apparatus, and was searching the seas for some ship to talk to; and she kept talking to us for about half-an-hour. Our receiver worked beautifully, and the tape kept running from the Morse printer without a hitch. 'We are the *Minerva*,' ran the message in Morse dots and dashes on the tape. 'We are operating experimentally. Please reply.' Then came a full stop, and then the message was repeated again. I acknowledged it, and told them who we were; but still the same message came running off the tape. After it had come through a dozen times in a few minutes, the captain of the liner got into a furious rage. 'Tell them,' he ex-

exclaimed, 'to chuck that machine overboard. Ask who let them loose. Tell them to work for Colney Hatch.' 'I can't tell them anything,' I replied. 'I think their receiver must be out of order, though they don't seem to know it; but it must be, or they would have received our reply and acknowledged it. Of course our transmitter may not be in order, but it seems to be all right.' The captain shrugged his shoulders, muttered something about 'those useless new-fangled notions,' and went away; and for an hour that irritating message kept coming through from the *Minerva* until we had got beyond her operating radius, which was about fifty miles. One night, a little while after, we expected to be called up by a liner passing some thirty miles east of us. I was on duty in the operating-cabin just about the time we expected to be called, and the captain came in to ask if I had been signalled yet. Almost at the same moment the tape began to come very slowly in short jerks from the printer. 'There you are,' said the captain, 'unless we have been picked up again by some experimenting pirate; that ought to be the liner. Get your reply through quickly, for I believe she has one of our directors on board.' I looked at the dots and dashes which came out on the tape, but could not make head or tail of them. 'I don't think it is the liner,' I answered; 'it seems to me a queer sort of message—nothing but a disconnected jumble of signs and letters. However, I will answer them, anyway.'

I depressed the telegraphic key of the transmitter, a big blue spark flashed out between the polished brass knobs on the coil, and our acknowledgment of the signals went out into space in ether waves which should have instantaneously operated any wireless receiver within a hundred miles of us and in tune with our transmitter. Then I proceeded to ask, 'What ship is that? We are the —— for New York.' But no response came through our receiver—nothing but a mysterious jumble of letters that came out on the tape in jerks. 'It is just possible,' I remarked to the captain, 'that we have picked up a message in code passing between two men-of-war.' 'Or perhaps there is a monkey on a raft somewhere near us,' replied the captain, who got very irritable at this latest freak of our wireless apparatus, 'and he is sending us messages with a biscuit-tin.' By the time we reached New York our captain had lost any faith he had in the practical use of wireless telegraphy, and not, I must say, without some reason, for on that voyage we actually failed to establish proper communication with no less than five ships out of nine which we had endeavoured to signal or which had tried to signal us.

But, of course, the wireless service has been vastly improved since then. However, to return to the mysterious message just mentioned, I found out, after a most elaborate examination of our apparatus, that a big beetle was crawling about the relay of the receiver, and the dots and dashes were nothing more than a record of his wanderings in a place where he had no right to be. The liner, by the way, never succeeded in getting through to us, though she made several attempts to do so.

During the past few years, as we have said, the whole system of wireless telegraphy has been immensely improved. On many liners, from the start to the end of the voyage, a staff of operators is continuously at work receiving messages from and despatching messages to the nearest shore-station. I had a short time ago an experience on a liner which shows how very useful the wireless system may be on occasions. We had left Liverpool about an hour when an elderly gentleman came up from the cabin and asked me if I could get a message through at once to his office in London. Wireless messages from ships are sent first to the shore-station, where they are wired in the ordinary way to the persons to whom they are addressed. Sometimes, when several ships are 'talking' to the shore-station, some delay may arise in getting a message through, but in this instance I was able to send it at once. The message was to the gentleman's junior partner in the City, and was in code, so I did not understand it; but later the gentleman informed me that he had obtained from one of the passengers a very important piece of information concerning a certain firm in the City, and it was of such a nature as to make him very anxious to prevent his partner from engaging in a big transaction with the firm in question which he contemplated doing. By aid of a wireless message the senior partner, though miles out at sea, was able to warn his junior of the danger of doing business with this firm, and thus saved both himself and his partner from losing a great deal of money. On another occasion a well-known English theatrical manager who was going to America with a view to purchasing the rights in certain plays got into communication by wireless message with the playwright when we were three hundred miles from New York, and long ere we entered the harbour had secured the rights in the plays he required.

Often passengers who run short of ready cash send wireless messages to their bankers in New York or London for a remittance. The money is advised to the purser, who advances it to the passenger. But this system is not always advantageous to a passenger. I know of one gentleman who lost all his ready-money at cards in two days after we left New York. As soon as he could he got a wireless advice from his bankers for one hundred and fifty pounds, and ere the voyage was over had only a five-pound note left. He confessed to me before leaving the ship that he would never send a wireless message for money again.

The work of a wireless-operator at a shore-

station is much more monotonous than on a ship, especially when he is dumped down in some lonely spot, perhaps miles from even a little village. As a rule three operators are put in charge of a shore-station, which is, of course, connected by wire with the inland telegraphic system, and their duty chiefly consists in forwarding wireless messages received from ships and transmitting inland messages to ships. One operator must always be on duty, and under the system now generally adopted the incoming messages from ships are conveyed to him by the tappings of the Morse sounder on the receiver, which he can only hear through a telephonic headpiece connected with the receiver, and he has, therefore, continually to wear this headgear when on duty. Though it is, after a little practice, quite easy to read messages by the tappings of the Morse sounder, it is at first extremely difficult to distinguish these sounds from the queer noises that are continually coming through the receiver of a wireless apparatus, and the result is that an inexperienced operator will often reply to signals that are really nothing more than noises created by atmospheric influences on the wireless apparatus.

When I was on duty at a shore-station in the south of Ireland a little while ago I replied to an imaginary signal of this sort, and so managed to call up a man-of-war which was at the moment trying to signal another ship. After I had explained who I was, I received a shower of abuse for interfering with the signalling of His Majesty's ships, and was earnestly requested by an apparently very irritable naval officer not to play with a machine I did not understand the use of. A few days later I neglected to answer promptly a genuine signal, thinking it might be an imaginary one, and once more received a copious shower of abuse from an operator on board the man-of-war for my slowness in answering a call. However, an operator after a little practice can readily distinguish the sound of a real call from that of an imaginary one.

One of the strangest happenings I ever heard of in connection with wireless telegraphy occurred on board a man-of-war a year or so ago. I was well acquainted with the operator who was then in charge of the wireless apparatus on board the vessel, and it was he who told me the story. He was on duty at midnight when an officer came into the operating-cabin and began to ask him some questions about the apparatus, which during the day had been working most successfully, messages having been transmitted and received over a radius of one hundred and fifty miles without the least hitch. While the officer was talking he put on the telephone-gear connected with the receiver, and directly he did so he exclaimed, 'By Jove! we are receiving a message. I can hear tappings distinctly, though they are faint.' He took off the headpiece and handed it to the operator, who, however, could not hear a sound when he put it on. Then the officer put it over his ears again, and once more declared he could hear the Morse tappings, though they were still very faint. He then imitated the sound of the tappings he heard by rapping his knuckles upon the table on which the receiver stood. The operator listened attentively, and presently said, 'Well, the meaning of the message you are tapping out is, "Stranded in high-water. All in."' The officer at once exclaimed, 'Why, that is very like part of our code, though it is not quite correct.' The tappings, however, then ceased, and as nothing more came through, the officer left the cabin after a little while, agreeing with the operator that the tappings he had heard were probably imaginary. The next day, however, a message came through from another man-of-war to the effect that she had been trying to signal the *M*—— during the night at a distance of two hundred miles, but apparently could not get into communication with her. The *M*—— was working within a radius of one hundred and fifty miles, and so failed to record the message; but it was evident enough that this was the message which the officer had heard, and which had been quite inaudible to the operator, proving that the former must have possessed an almost miraculously fine power of hearing; and this turned out actually to be the case, though the officer up till that time had no idea that his hearing-powers were greater than the normal.

TOM MUSGRAVE'S MARRIAGE.

By Andrew Lang.

THAT Tom Musgrave, the Squire of Thornthwaite Hall, should marry, and the sooner the better, was the heartfelt wish of all the husbands within his sphere of influence, of all the girls, and of Tom's family.

'Marriage would steady him,' they all said; and, since they all believed that a reformed rake makes the best husband, none doubted that, as a married man, Thomas would be 'one entire and perfect chrysolite.' His age was thirty, though he looked twenty-five; he was the handsomest man, and one of the richest men, and quite the most reckless man, on the Border; the most daring rider, the best master of the small sword; and, having amused himself much abroad, he spoke French, and even Italian, like a native.

But Tom was a rake; his 'intentions' were

never 'vague,' and were never honourable. He loved his chartered libertinism more than any woman; no girl could persuade herself that Tom, for her, had ever been 'serious.'

It chanced one day that Mr Musgrave was loitering outside the Carlisle County Hotel at the moment when the 'Flying Rocket' from the south was changing horses for Gretna Green, the next stage. There were but two inside passengers —a young man of a moody and apprehensive air, but much the buck in his attire; and a very young and beautiful girl, dark as night, with flashing teeth, glorious but mischievous brown eyes, and ankles displayed as she alighted from the coach, ankles which drew Tom with magnetic virtue. He had not the least doubt that the destination of the pair was Gretna Green; they were hurrying, as their anxious glances southward down the road too clearly betrayed, to the hymeneal blacksmith.

To book a seat in the inside of the coach was to Tom the work of a moment. He then obscured his presence till the horses were actually in motion, when, with an elegant bow, he leaped into the vehicle. The young pair bounded apart. The young man glowered; the girl, on the other hand, beamed on Tom with a gracious and captivating smile, so that he had the impudence to seat himself beside her. Her lord that was to be, with a sullen glance, took his seat on the opposite side, with his back against the corner, folded his arms, and closed his eyes.

'For a runaway pair, they are of the strangest,' thought Tom. He passed the time of day with the lady, who at once opened a lively conversation on the scenery and the gentlemen's seats.

'That lovely old red house on the hill?' she asked.

'That is my own, Thornthwaite Hall. My name, at your service, is Musgrave.'

'Of the dear, famous fighting Musgraves!—Darling,' she said to her companion, 'do wake up, this is *so* interesting!'

The darling merely grunted.

'Oaf!' thought Tom.

'Monsieur,' asked the lady suddenly, without lowering her voice, but giving Tom the full benefit of eyes that were swimming in sudden tears, and a face which blushed like dawn on Skiddaw, '*vous parlez Français?*' The accent was Parisian.

'*Si, mademoiselle, assurément,*' said Tom, thinking, 'Here *is* an adventure!'

The girl went on very rapidly in French, '*Mademoiselle!* too soon to be *madame!* You see before you a most unhappy woman, in a situation the most unwonted and deplorable. I am very young. I fear that I have been very foolish. You are a gentleman; you are of an age to which a girl so young as I can appeal with safety.'

'*Already!*' thought Tom, his vanity severely wounded. He was thirty, she was seventeen. To her he must seem a patriarch.

'May I ask for your counsel, and, if necessary, for your protection?' the girl went on.

The astonished Tom could only bow, and say, 'My sword and life are at your service.'

She rewarded him with a glance which would have fired a magazine, and gave him her hand, exquisitely gloved. 'We fled together,' she went on, always in French. 'Never mind monsieur there, who pretends to sleep; he does not know the language. We fled together, at a very early hour, but the other two failed us.'

'The other two?' asked Tom, puzzled.

'Yes, Fanny Flouncey, who was going off with monsieur there; and—and a friend who was going off with *me*. Fanny was watched and caught; but he—he is a coward, *un lâche*. That the heir of a peer of England should be a coward! But I am poor, though of a good house. I had left a note for my father. I could not return—to be whipped. I went off—with monsieur.' Here she shed a few tears.

Tom was deeply moved. He squeezed her hand, also her dainty waist. 'Went off,' he asked; 'but why with monsieur?'

'He loves me, has long loved me. I refused him. He tried to console himself with Fanny. She failed him. He is here; and, if we are not caught—is that the sound of galloping horses?—no—in an hour or two I shall be Madame Batson.'

'But is there no hope? The other—— There must be some mistake, some explanation. You loved him,' said Tom, in the softest and sweetest French, looking into her glorious eyes.

'My love is turned to hate. I could eat his heart in the market-place. Oh that I were a man! Oh that my brother were in England! Our proud motto is, "Faith fears not!"'

She was, without doubt, the most beautiful girl Tom had ever seen. She had *spirit*, and spirit was what Tom adored. 'Faith fears not,' he said. 'That is the motto of my dearest friend—though, thanks to the wars, I have not seen him for years—Jack Grey of the Rifles.'

'I am his sister,' said the girl proudly.

'Then let me be your brother,' whispered Tom.

She pressed his hand, and he was about to offer a fraternal kiss, when she sprang away from him. Mr Batson opened his eyes for a moment, muttered an oath, and closed them again. 'You are like all other men, a coward!' Miss Grey hissed in French. 'I will go back—not to my father and the whip, but to my Paris convent. The Sisters are my only friends.' She then turned her back on Tom. He guessed, from her heaving shoulders, that she was weeping bitterly.

'I am a cur,' he thought, 'and she the sister of the best and bravest man I ever knew, and the most reckless. I—damme!—I can't live without her. We are well matched—birth and character. And such eyes I never saw in a woman's head! I wish I could see them again. Egad! *I'll do it.*—Mademoiselle,' he whispered in French. She glanced round. 'I crave your pardon. Is there not one way? I never saw your like. I cannot live without you. I never knew what love was before. Is not Thornthwaite Hall, with your brother's dearest friend—when you come to know your brother's dearest friend—better than a Paris convent?'

Her grave eyes read him through and through. 'You are mocking me, monsieur, in my folly and shame and fear; but here are cottages, a village. I will find some magistrate, some kind clergyman'——

'It is Gretna Green,' said Tom; and the coach stopped at the blacksmith's cottage. The priest of Hymen stood at the door to welcome them.

'Stir your shanks,' said he; 'come in wi' ye. I see four galloping horses on the braeheid.' A faint sound came down the wind.

'It is my father's view-halloo!' said Miss Grey, and fell into Tom's arms. At the same moment he was seized by the collar from behind by the infuriated and ill-used Mr Batson. Tom threw him off, Batson lugged out, Tom drew his sword, they engaged, while the stalwart blacksmith carried the lifeless Miss Grey within his cottage. When he returned it was to see Batson's sword flying high in the sunlight, while Tom, as his disarmed adversary turned to look for it, sprang into the cottage, followed by the blacksmith. In a moment they had barred and bolted the door, at which Batson beat hopelessly.

The sound of galloping hoofs drew nearer; but the blacksmith had his witnesses ready, folk of his own household, and proceeded to perform a hasty marriage rite.

One of the family supported Miss Grey, pale and tearful. It was a rapid ceremony.

'You?' asked the amateur priest.

'Thomas Musgrave.'

'Man, I wonder to see you! Take this woman'——

'Annabel Grey,' said Tom, supplying a Christian name at a venture.

'For your wedded wife?'

'I do!' said Tom.

'You, Annabel Grey, take this man for your husband?'

'Indeed I don't!' cried Miss Grey; and, with delightful musical laughter, she shook her head at Tom and fell into a chair, convulsed with mirth. 'Open the door,' she said when she could speak. 'I've won my bet!' and she executed a slight but exquisite dance-movement.

The door was opened; Mr Batson entered, all grace and smiles. 'Let me introduce you,' said Miss Grey. 'Mr Thomas Musgrave—my brother Billy.—We've won, Billy! Where are the fierce pursuers?'

'Oh, they galloped back again on my advice. They did not feel quite certain how Mr Musgrave might take the joke.'

'Which Mr Musgrave has not yet the felicity of perceiving,' said Tom very stiffly.

'And yet, Mr Musgrave, you have played not a few jests in your time,' said Miss Grey with a smile which melted his mood. 'I am Molly Grey—mad Molly Grey they are kind enough to call me. Since I came home, a month ago, from my Paris convent, I heard, Mr Musgrave, of your cruel, wicked reputation. I betted that you would make me an offer of marriage, and you *did;* and, oh,' she managed to gasp through her laughter, 'there are witnesses enough.'

'Mademoiselle,' said Tom, speaking rapidly in French, 'is not Thornthwaite Hall, with your brother's dearest friend, *when you come to know your brother's dearest friend,* worthy of'——

'We shall see,' said Miss Grey, 'when I come to know him.'

At the end of a month of learning to know her brother's best friend, that gentleman led her to the altar.

THE SITTER IN THE SUN.*

He sits there in silence dreaming,
From the call at break of day
Of the muezzin on the minaret's slim height,
Till from out the white town gleaming
All the Faithful turn to pray
At the feathery floating falling of the night.

East and west the crowds are pressing,
Yet no curious eye he bends;
Indifferent to struggle and to strife,
Deaf alike to ban and blessing,
Blind to mortal aims and ends—
What are these to him but shades that fall on life?

Do his dark eyes pierce the ages,
Dreamed delights that on him wait?
Doth he muse on Paradise and houris won?
Doth he languid turn the pages
Of the Seer's Book of Fate,
This shrouded, silent Sitter in the Sun?

Dazzling sunlight, falling, blinds him,
Touches lovingly each fold
Of his burnous sweeping widely in the dust;
And the camel's-hair that binds him
Glows alive with burnished gold;
And his simple want contents him with a crust.

Why should man for that or this fret?
It was written long ago.
Allah's Allah! Destiny awaits each one.
The great Prophet's creed of 'Kismet'
Circleth every bliss or woe
To this solitary Sitter in the Sun.

MARY M. CURCHOD ('MYRA').

ALGIERS.

* In the census papers recently taken here an Arab at Constantine described his occupation as that of 'a Sitter in the Sun.'

SERPENT-WORSHIP IN WESTERN BRITAIN.

By the Rev. D. GATH WHITLEY.

MISS GORDON CUMMING, in her delightful book entitled *In the Hebrides*, gives a most graphic description of the great serpent-mound which she visited near Oban, on the coast of Argyll. She found the mound in a lonely valley by the side of a solitary loch. This remarkable relic of primeval days consisted of a huge artificial mound forming a double curve, like a gigantic letter S, and was three hundred feet in length, while it was nearly twenty feet in height. The head lay at the western end of the mound, and projections diverged from it, giving the idea of limbs, so that the mound might rather have represented a mighty dragon than a serpent. A circle of stones rested on the head, in the centre of which were formerly traces of an altar. The spine was made of large stones to resemble the vertebræ of the reptile, and was in fact a long and narrow causeway.

The age of this extraordinary serpent-mound may be guessed from the amount and depth of the peat which was found by Miss Gordon Cumming and her friends to have accumulated all along the top of the backbone of the serpent. This extraordinary monument of prehistoric days is not the only one of its kind in the neighbourhood, for Mr Phené has found similar serpent-mounds, although of smaller size, in other lonely valleys on the western coast of Scotland.

Who constructed the great serpent-mound near Oban, and why was this wonderful monument erected? We naturally think first of the Scandinavian sea-rovers, who ravaged the coasts of Scotland for centuries, and in whose traditions the serpent and the dragon played such a prominent part. In the old Norse mythology a mighty dragon called the Nidhug lay at one of the roots of the celestial Ash-Tree, the boughs of which spread over the world; and so gigantic and so terrible was this monster that when the Norse gods met in council it formed the subject of their conversation. The Midgard serpent also dwelt in the depths of the sea as a mighty snake. Thus it was that the Scandinavian sea-pirates pictured the depths of the ocean to be the home of

> That sea-snake tremendous curled,
> Whose monstrous circle girds the world.

There are carvings of serpents on the rocks along the eastern coasts of Scotland which are justly considered to be of Scandinavian origin, and it is most natural to refer the serpent-mound near Oban to the Norsemen, whose traces are so numerous in our northern islands. Nevertheless, there are difficulties in this supposition. The age of the Oban serpent-mound seems to be much greater than the era of the Scandinavian pirates. It is associated with rude stone monuments of great antiquity; and, moreover, similar serpent-mounds are found in countries never visited by the Scandinavians. In North America, at Brush Creek in Ohio, there is a gigantic mound of earth in the form of a serpent. The body of the monster, which is stretched out in graceful curves, is seven hundred feet in length, and its jaws are wide open to swallow an egg which it holds in its mouth, and which is represented by a mound one hundred and sixty feet long and eighty feet thick. In the religion of the ancient civilised races of America the serpent played an important part. Serpents were carved on the walls of the sacred edifices in Mexico and Peru, and even upon the surface of the rocks. The Indians of North America also believed that a vast serpent dwelt in the great lakes, and that it was necessary to appease the wrath of the monster with constant offerings. In all these cases the gigantic serpent-mounds and the elaborate carvings representing these reptiles could have had nothing to do with the Scandinavians or with their mythology.

When we turn to Ireland we find strange legends describing conflicts with gigantic serpents which could never have really occurred, and which are mythological and allegorical. The Irish saints are said constantly to have destroyed mighty serpents, and their followers and converts had similar encounters. There is truth behind all these strange stories; but this truth can only be discovered by interpreting the stories in the light of modern research, and by considering them to describe figuratively the struggles between men of different races and of different religions.

We know that in ancient days the worshippers of animals frequently called their priests, and especially their chiefs, by the name of the animals they venerated. Thus the chiefs of

 [*All Rights Reserved.*]

the clans and the tribes which worshipped serpents were themselves called 'serpents,' while their settlements were similarly named. We read in the Old Testament of a king of the Ammonites who was called Nahash, a word which means a serpent; and others in the Bible bore the same name. In ancient times the islands of Rhodes and Cyprus were called Ophiusa, being the residence of the Ophites or serpent-worshippers; and Sir Emerson Tennent tells us that the ancient name of Ceylon was Naga Dipo, which signifies the island of serpents. The ancient records of the Aryans state that when they entered India they overthrew monkeys, demons, and serpents, these signifying animal and serpent worshippers, who to the Aryans—possessing a purer and loftier faith—seemed to be brutes and reptiles. In Central America, at the time of the Spanish invasion, the worshippers of the great serpent were themselves called 'serpents.' The Nahuas were among the most civilised and cultured inhabitants of Central America, and they are often called 'the men of the race of the serpent.' The empire of Xibalba, in the same region, was called the Dominion of the Serpents, and its capital city of Palenqué, the ruins of which even now excite such admiration, was known in ancient times as the Town of Serpents.

Now, according to Mr Fergusson—whose great work entitled *Tree and Serpent Worship* has for long been one of our very highest authorities on this question—most of the prominent myths in ancient history which are of the greatest antiquity are serpent-myths; many are doubtless grotesque remembrances of important events which happened ages before, and others relate the destruction of inferior tribes who worshipped serpents by powerful invaders professing a different religion. Later stories which tell how Christian saints overthrew mighty serpents may have originated in the conversion of some illustrious serpent-worshipping chief and in the destruction of his serpent-sanctuary. Thus we are told that St Philip killed a huge serpent at Hierapolis; and as that city was sacred to Æsculapius, the god of medicine, whose emblem was a serpent, the story probably originated in the conversion to the Christian faith of some celebrated priest of the serpent-divinity. Similar stories in Western Europe may be explained in the same manner, and such traditions also exist in different parts of Great Britain.

J. F. Campbell, who with such indefatigable labour collected so many of the weird traditions of the Western Highlands and the Hebrides, relates many legends which confirm these ideas. Serpents were, he found, again and again connected with customs and legends of the wilder parts of Scotland. A great white snake of monstrous size was said to infest many parts of the Highlands, just as in the present day the king of cobras in Ceylon is said to be a white snake of this species. The Druid priests in Scotland, amongst their other names, bore the title of 'serpent,' so that when we read of the Christian saints in Western Britain overthrowing mighty serpents, we may consider these stories to be dim recollections of the conversion or banishment of the serpent-worshipping priests by the preaching or the influence of the early teachers of Christianity. Like St Patrick, who drove the serpents out of Ireland, St Columba is said to have expelled all the snakes from his holy island of Iona; and as the Druids had possession of the island long before it became a Christian sanctuary (the pagan name being still attached to it), this latter story seems simply to tell how the Druid serpent-worshippers were expelled from Iona by the exertions of St Columba and his followers. Dim traditions in the wilder parts of Western Scotland speak of heroes overthrowing mighty serpents or dragons. Thus John the Fisher's son killed a dragon with nine heads in Barra, and Fraoch destroyed a mighty serpent on the grand granite mass known as the Ross of Mull. These legends most probably refer to the overthrow of renowned serpent-worshipping chiefs, who called themselves 'serpents,' and were slain by the invading Gaelic Celts. In the wilder parts of the Highlands of Western Scotland there were formerly weird stories of mighty serpents living beneath the waters of certain lochs. There must be some real foundation for such stories.

In Ireland similar traditions are still more numerous. Omitting the famous story of St Patrick driving the serpents down a steep hill in Mayo into the sea—which may be explained by the expulsion of the serpent-worshippers by the saint and his followers—we find many loughs and hills connected with the existence and overthrow of mighty monsters. Hidden beneath the waters of many Irish loughs gigantic serpents are said still to exist, and at times even to appear. The saints in Ireland, as well as their followers, were constantly overthrowing these terrible creatures. Thus, by chasing it into a lough, St Barry destroyed a huge serpent which desolated the district of Slieve Bann. St Patrick killed a great snake in a similar manner, and a multitude of Connaught men chased a huge serpent to the neighbourhood of Ballymena, where they killed it, and raised a great pile of stones upon its body to commemorate their triumph. This story possibly is a dim recollection of the hunting down of a priest or great chief of the serpent-worshippers by the ferocious Celts who might have been early converts to Christianity.

The worship of trees, rivers, and springs of water goes far back into prehistoric and pagan days, and it is remarkable that many of the holy wells in the north of England are said to have been guarded by mighty serpents and terrible dragons. Thus the holy well of Thurston

was said to have been guarded by a dragon; and a fearful serpent dwelt for a long time at the Worm Well near Lambton, in Durham, and was ultimately killed by a knight who had returned from Palestine. Even in the western regions of Devon and Cornwall such stories are related. The earliest tinners on Dartmoor fought desperate battles with gigantic serpents and mighty dragons, which are said, long ages ago, to have wandered over the great moorlands in central Devonshire. The Cornish saints in olden times gained great victories over huge serpents, and in many parts of Cornwall desperate struggles took place between dragons and heroic warriors. Such stories can be simply explained. They probably refer in their *ultimate* origin to the capture of the strongholds of pre-Celtic serpent-worshipping tribes by the Celtic invaders of Devon and Cornwall, and to the slaughter of the great chiefs of the former race, who, from the objects of their worship, were called 'serpents' and 'dragons.' All this shows the resemblance between the earliest traditions existing now in the Highlands of Western Scotland, the west of Ireland, and in Cornwall, and this is clearly owing to the inhabitants of these remote districts having preserved longer than those of other parts of Great Britain those primitive stories which relate to the conflicts of the Celts and still older aborigines.

But the honours paid in Britain in those far-distant days to serpents, and the veneration of mighty monsters which were said to inhabit lakes and landlocked arms of the sea, point to something further. The sea in primitive times was regarded with feelings of awe and terror by our oldest British ancestors; they looked upon it as a dreadful monster ready to devour the land, and to be propitiated by sacrifices. Hence they personified the dark and stormy sea as an awful divinity who ruled supreme over the winds and the waves. When the Romans subdued Britain its chief divinity was a sea-god called Nudd or Nodens, who was specially worshipped at Lydney, near the Severn, and was also venerated as Domnu, a name connected with Dumnonia, the ancient name of the peninsula of Western Britain. Professor Rhys also thinks that the Dumnonii of Scotland and the Severn took their name from this mighty ocean-god, who must have been a kind of primitive Neptune. In Cornwall, in olden days, a mighty ruler of the ocean, whose name was Bucca-boo (which was evidently a corruption of Bucca-dhu, or the Spirit of Darkness), was held in superstitious awe. To this terrible monarch of the deep sacrifices were offered on the beach in order to appease his anger. Even until comparatively recent times the Cornish fishermen were careful to do nothing that might offend the Bucca-boo.

Similar beliefs can be traced in Western Scotland and in the Hebrides. Martin, in his *Description of the Western Islands*, tells us that in his day he had seen a sacrifice offered to the ocean-god by the natives of the Hebrides on Hallowe'en. Legends have also existed in remote districts of the Scottish Highlands of maidens chained to rocks to be devoured by a monster from the sea to propitiate its wrath, and of their deliverance by a warrior who slays the sea-monster. These legends—which recall the myth of Perseus and Andromeda—clearly originated in the devoting of a maiden (often the daughter of a great chief) to be sacrificed to the sea-divinity, and her rescue by some neighbouring Gaelic champion, who slays the priest of the ocean-dragon.

It seems probable that the mighty ocean-god was personified as a gigantic serpent which dwelt in the depths of the sea, and exercised sovereign power over the winds and waters. J. F. Campbell tells us how mighty serpentine forms were held by the Western Islanders to inhabit the sea, and he thinks that the monstrous serpent of the deep had the attributes of a god, and was the same as the mighty snake of the *Edda*, which encircled the world. In the frontispiece of his fourth volume he portrays the different legendary forms of Scottish tradition, and in the middle of the picture, the most prominent form of all, is seen the mighty serpent of the sea swimming in the midst of the waves. He thinks, also, that the Scottish stories about the fairies originated in the existence of a dwarf-race in Scotland in prehistoric days, who resembled the present-day Laplanders in many respects. The Lapps in ancient times worshipped a great serpent, and had their priestesses, who professed to be able to control the winds and waves. Possibly the prehistoric Scotch fairies were of the same race and had the same worship.

The worship of the sea-dragon or serpent was in ancient times widespread. In the oldest records of ancient Babylon the ocean was considered to be the representative of everything destructive and horrible. The raging sea was personified as a mighty foaming dragon, which had its home in the depths of the ocean, and was venerated with the profoundest awe. It was called 'the huge seven-headed serpent which pounds the waves,' and the scriptures of the Old Testament contain more than one reference to 'the dragon of the sea.' The great sea-dragon of China seems to have had the same origin, for the connection between ancient Chinese literature and the primitive inhabitants of Babylonia seems now to be well established.

From Babylonia and Phœnicia the belief in a mighty ocean-divinity spread in different directions. But there are even earlier traces than this of the adoration of the awful powers of the sea. The earliest wanderers over the earth appear to have belonged to the Turanian (or Mongolian) branch of the human family, and they seem from the very dawn of history to have venerated the mighty serpent of the

ocean. Wherever this primitive race has spread, whether in Europe, Asia, or America, the great serpent or dragon of the sea has been held in superstitious awe. Possibly these gigantic serpents or dragons of the deep which were so profoundly venerated in olden times were the same as the mighty serpent which Miss Gordon Cumming describes as represented in the great curving mound in the lonely depths of Glen Feochan, near Oban.

THE CAHUSAC MYSTERY.

CHAPTER V.—WILFORD.

DE SARSAN sat in the smaller smoking-room at Fetterings, and rings of dissolving blue, drawn from a very excellent cigar, curled up in almost rhythmic succession to the ceiling. Everything was going well, very well indeed, in his own particular world. He, who had formerly been a journalist and, as occasion offered, a politician, was now a politician and, as occasion served, a journalist. He had made of his career a huge personal success. He had fought for his own hand and prospered, prospered and risen until he became the ruler of his own section of the universe. All this he had become by doing less for his fellows—except in the way of business—than is usual even with the most selfish of mankind.

His newspaper permeated France. He led public opinion to a very large extent. He was regarded as a man who had his eye perpetually open to many interests, individual and national. He had made it a very leading point to expose frauds of various kinds, little frauds whose promoters were not strong enough to turn and rend him. Thus he had shown himself to be worth bribing by richer and more powerful rascals. Experience had made him a past-master in the art of underhand bluff. His boast that he could make and unmake a Ministry by scientific wire-pulling was not altogether a vain one. His sole restraining principle was self-interest, and he took care to make the fact known to those whom it might concern. Therefore his wealth increased with the rapidity he had every right to expect.

As was natural, such a man could not be without enemies; singular to say, he had no friends. Yet this friendless man was eminently capable of getting others to serve his ends. He enunciated a system of *quid pro quos*. He was quick to see the goals towards which other men were directing their energies; thus, knowing the ultimate aim of each career, he was able to further or retard its progress as suited his own convenience and designs. To hold his entourage in leash was more than a wise precaution to De Sarsan; it was his recreation. At the present moment he was occupied with a new scheme, one which appealed not at all to his pocket, but a good deal to his head, and most of all—and this sensation, from its rarity, had a keen zest about it—to his heart.

He remembered that his first considerable step upwards had been taken by means of a woman. The documents he had procured from Lady Cahusac had transformed him from a troublesome petitioner into a *persona grata*, and given him a place of consideration with the various Continental bureaus. By means of another woman he now proposed to reach the highest scale of the ladder he had long ago set himself to climb.

He was thinking over this pleasant subject when the door opened under an impatient hand, and swung to behind Lanceley, who, with a scowling glance at De Sarsan, flung himself on the cushions of a settee and fell to studying the fire in sulky silence.

De Sarsan continued to smoke luxuriously, but his half-closed eyes took in the fact that the handsome, flushed, brooding boy opposite believed himself to be more than usually at odds with the world. It was curious how unanimous Wilford Lanceley's acquaintances were in accepting his boyhood as an established and continuous actuality.

'I say, De Sarsan, if you have a remark to make, don't be delicate about it. I prefer that to knowing you're grinning at me under your moustache!' burst out Lanceley at the end of some minutes.

The Belgian raised his eyebrows, and removed the long ash of his cigar with elaborate care before he spoke. 'My dear young friend, what is it?'

Wilford Lanceley turned his head slightly so as to look fair across at his interlocutor. 'The devil's in it!' he said savagely.

De Sarsan noted the eyes, the blazing, wonderful light-blue eyes. Wilford's beautiful sister possessed just such eyes, although De Sarsan had never seen them blaze yet; but he flattered himself that in the interesting future there were few expressions he should not have the pleasure of admiring in those same eyes.

'But, my dear Wilford, you are not explicit,' he objected. 'The devil is—so they tell me'—he shrugged his shoulders apologetically—'in most things. Now and again his head pops up into view, and we conventionally pretend to be surprised, even shocked! Pray in what direction has the devil appeared for you at this particular juncture?'

'All along the line.'

'It is so sometimes, but he passes on elsewhere, always he passes on. We are none of us

sufficiently important to usurp the whole of his valuable attention.'

'Hang it all, man, can't you see I'm not joking?' expostulated the other. The hot fit was almost over, and in the cold he craved support.

'Precisely, so I perceive; and if you had but given me time, I was about to offer you any help which it may be in my power to give. I need not repeat, Wilford, that you are one of the very few men whom I have ever desired to regard as a friend.'

'Just so,' agreed Wilford, who had preserved with his other youthful habits that of accepting all things as his due without a notion of gratitude or return. 'Look here, I'm in no end of a tight place. Debts, Jews, the deuce of a position to keep up and nothing to keep it up on. Just at this moment, too, when'—— With a curse, he thrust his forehead into his hands and stopped short in his complaint.

Then followed a long pause, no sound but the crackling of the flames about the log on the hearth.

'I can't hang on any longer,' broke out the young man again; 'and if I have to leave the service, I must leave the country. You don't know what it all means to me!'

'Ah, I see. It would naturally be easy for you to leave the country,' De Sarsan began in a measured tone, 'were it not that first it would be necessary to send in your papers. Am I not right?'

'Curse it, yes! I'm awfully dipped in the regiment.'

'But I understood that you had a friend?'

Wilford did not raise his head, and there was an alteration in his voice which might have led one to believe he was half-ashamed. 'The fact is,' he said, then paused. 'Is it strictly between ourselves, De Sarsan?'

'But certainly, my dear fellow.'

'I have a friend, as you call it, but her resources have been pretty heavily drained. And the Jews won't come up to the scratch any more!'

'That,' remarked De Sarsan, 'is awkward for you, and—pardon—for your friend.'

Wilford laughed with some embarrassment, his head still in his hands. 'You may as well know it all. Can't you guess who the friend is? I haven't so many! It is Alice, of course.'

'Ah, but how is this? She is not yet of age?'

'No, no,' irritably; 'but she gave me her written promise years ago.'

'Years ago?'

'Yes, when she was sixteen. She backed herself to pay my debts whenever she got her fortune into her own hands. I'd have gone under long ago but for that, you know.'

De Sarsan, aware that his companion was not looking at him, nodded his head at each item of information as one does who checks off known facts, and is making sure that nothing is omitted. At the end of the last speech he remained silent. Absence of comment here bore but one interpretation to Wilford's mind.

'Surely you, De Sarsan, are not one of the strait-laced lot who would blame me?' he asked bitterly. 'I knew well enough what I was doing. Alice is said to be handsome, and she is certain to marry. If she had been one of your plain sort, of course, I'd never have touched a penny. As it is, she won't feel the loss. Can't you see that?'

'*I* see perfectly that whoever had the good fortune to appear acceptable in mademoiselle's eyes could not, for so much as a second, spare a thought to anything beyond her own personal attractions.'

Wilford threw himself back. 'Exactly. I knew you'd agree with me; any sensible man would.'

'Yet there are a large number of persons whose good sense, from your point of view, would be conspicuously absent,' went on the Belgian.

'Lord! that's the least of my bothers!' Wilford laughed in renewed excitement. 'The chief trouble of my life at this moment is that I want to get married myself. Then I could provide for Alice as long as she wanted it. That's my point.'

'I perceive how you regard it; but what aspect would your conduct in relation to your sister's fortune bear in the estimation of most people?' asked De Sarsan incisively.

'I tell you, Alice is one of those women who are only happy in sacrificing themselves. She would sell herself for my sake.'

'And you would permit her?'

'Faith, I don't see why she shouldn't be happy in her own way! But drop that, De Sarsan. I tell you I could settle everything if only'——

'You could by any means secure a complaisant brother-in-law—eh, my friend?'

Wilford stared. Enveloped as he was in his own emotions, an undercurrent in De Sarsan's words struck him. 'I say, do you mean—yourself, by any chance?' he asked rather slowly.

A slight shadow crossed De Sarsan's face. 'I mean myself,' he answered very deliberately. 'Have you an objection—by any chance?'

Wilford pulled himself together. 'Lord, no; let her please herself! Only, I had some sort of notion'——

'Yes?'

'You took me by surprise, you know. I imagined your foreign folks would look blue if you, of all men, married an English girl.'

'I can endure that for mademoiselle's *beaux yeux*. But your other notion?'

'You seem to know what a fellow's thinking of, by Jove! I was going to mention that I had a sort of notion that Malcolm Cahusac and Alice might hit it off. He's a bit callous; but that may be on the outside, don't you know? On

second thoughts, I've no grounds for saying there is anything between them. Go in and win if you can; you've my good wishes.' He scowled again suddenly. 'Look here, De Sarsan; here's a bargain for you. If you'll keep Cahusac out of my way, I'm hanged if I don't keep him out of yours!'

De Sarsan was at last genuinely astonished, but he only asked for an explanation.

'It's Lorrie Madesson. I tell you here, in cool blood, I'd die next week if I could make her my wife to-day! That's how it lies with me.'

'More than one man has said as much in my hearing before now.'

'I know all about that. They said Gridley of ours and poor Tommy Sorrel, the brewer's son, went to the bad for Lorrie's sake. That's where I grow desperate when I look forward. If I failed! De Sarsan, I tell you frankly I came here to ask you to help me. People say that you can do whatever you set your mind to. You're always calling me your friend; well, let's see it act now. Lorrie's money would set me on my legs again. Not that I care a curse for that; I'd take her without a penny if I could! But as she has the needful, so much the better. Why, man, I'm dying for her! I feel as if my heart would burst sometimes!' He threw himself into his old attitude of despondency, biting at his moustache.

The colour had gone out of his face, and was succeeded by a curious pallor. De Sarsan turned a glance on him; then he considered his whole face and figure more attentively. Wilford looked haggard and drawn, and he had grown very thin of late. Either he had stronger feelings than any De Sarsan had given him credit for, or—— A faint gleam of a new and satisfactory idea strayed for a moment over the Belgian's features.

'I promise you my help in return for yours. As long as you stick to your bargain you will find me stick to mine. Be joyous! When I choose'—he sank his voice—'I can almost promise success. So!'

Wilford sprang to his feet and wrung the other man's hand. 'God bless you, De Sarsan!' he exclaimed, and walked out of the room. There were tears in his eyes.

'God bless you, De Sarsan!' echoed the Belgian sardonically. 'In the name of the devil, my friend! *Parbleu*, yes!'

(To be continued.)

THE DUELLO.

'WHAT is Tybalt? More than Prince of Cats, I can tell you! Oh he is the courageous captain of compliments! He fights as you sing prick-song; keeps time, distance, and proportion; rests me his minim rest, one, two, and the third in your bosom; the very butcher of a silk button, a duellist! a duellist! A gentleman of the very first house, of the first and second cause. Ah, the immortal *passado! the punto! reverso! the Hai!*' This is Shakespeare's picture of the approved arbiter of honour, and in the Middle Ages such a definition was generally accepted as that of a very perfect gentleman. Since then the practice of duelling has been considerably modified. In the days of D'Artagnan if a passer-by insulted a stranger by so much as a disparaging glance swords were drawn and the quarrel settled on the spot, without surgeons or timekeepers—least of all newspaper reporters. Nowadays, however, in France—which is the acknowledged home of duellists—an individual who hankers after notoriety has only to write and publish an offensive paragraph concerning an author, actor, or other more or less already well-known personage, and the whole machinery of the code of honour is at his disposal. I say advisedly a 'well-known personage,' for it is seldom indeed that the name of any private man figures in the almost daily *procés verbaux* that can be read in the Paris Press. In France the precious possession of honour appears to be confined to a few hundreds of the literary, dramatic, and political worlds, who use and abuse their capital with the greater freedom that the more it is drawn upon the stronger it grows, and there is never any fear of depreciation or other damage.

The process followed is at once solemn and simple. A deliberate provocation having been offered, two friends whose names will look well at the foot of the official report are despatched, in frock-coats and *huit reflets* hats, to demand reparation, and are at once put into communication with a couple of equally distinguished representatives of the foe. The only object of the business as a rule being self-advertisement, the *quatuor* quickly agree that nothing but blood can wipe out an insult which might well have been treated with a shrug of the shoulders. A day and hour are fixed for the meeting, and a whole *posse* sets out for the scene of action. If the weapons are to be swords, the points are carefully 'flared' in a spirit-lamp, a 'director of the combat' with a walking-stick places the two men opposite each other, the timekeeper produces a stop-watch, whilst the doctors ostentatiously prepare their dressings, and photographers and kinematograph operators focus the duellists. When all is ready the word is given, and according to the skill or impetuosity of those engaged the fight proceeds, until one of them receives a wound which 'places him at a manifest disadvantage.'

As in the modern duel the habit is to aim

always at '*les avancés*,' or at the hand, arm, or knee, this wound is usually a scratch on the wrist or forearm. It is, however, all the balm that mutilated honour demanded, and as soon as it has been applied the adversaries are separated, often only immediately to embrace each other affectionately, and congratulations are offered and accepted with delight by all concerned. If pistols are used the men are put up at twenty-five paces, and the seconds take good care that no harm shall happen. A duelling-pistol is a delicate and deadly arm if properly loaded, but with a bullet made of blacklead, or a double charge of powder to throw up the aim, it is an innocent toy. After a pistol-duel it will always be read that 'two bullets have been exchanged;' but this is a distortion of speech and fact, for only one shot has been fired by each, and though two bullets have flown, only one has been 'exchanged.' Pistol-duels are usually much less dangerous even than those fought with swords, when accidents may occasionally happen in spite of the vigilance of the director of combat in keeping the men at double swords'-length so as to obtain the necessary prick which places one of them 'at a disadvantage.' This term alone suffices to show the huge absurdity of the business. If one man has so grievously offended another that he is compelled to give the latter a chance of killing him, by what process of logic can it be argued that as soon as the offended party has obtained a slight advantage he is to forgo all further hope of satisfying his vengeance? To agree with the dictates of common-sense, a duel should only be fought if the aggrieved person believes that he is in a position seriously to damage his adversary or kill him, or if he is prepared to be killed himself rather than subsist under the affront. Consequently law and custom should provide either that the duel must be fought to a finish satisfactory to the aggrieved party, or that the man first wounded should be compelled to apologise completely, and, if he is the offender, to pay a very heavy penalty to save his life from the supposed danger he is in of losing it.

As it is practised to-day, the duel cannot by any stretch of imagination be looked upon as really constituting what it is supposed to be. The academical description of a duel is a 'reparation' by arms, and if it is not a reparation, all other considerations, equally for or against it, fall to the ground. Its advocates say that it is a school of courage, an elegant and gentlemanly way of settling a dispute; it is regulated by nice distinctions, thanks to which honour is always preserved; and it is one of the few relics of a glorious past age of chivalry that are left in France. It would be easy to answer these pleas *seriatim*, but it is unnecessary to do so, because they are all beside the mark. The duel is openly demanded and agreed to as a reparation, and it is not one unless it answers the object for which it exists. According to the ethics of duelling, a man who has fought against another who has offended his honour is supposed to have wiped off the disgrace, whatever be the result of the duel. But if I am accused of some dishonest and disgraceful act that damages my reputation, what difference can it make if I call out the offender, and even wound him severely? Supposing that he elopes with my wife or carries off my daughter, is his crime mitigated or the injury to me repaired by my inflicting or receiving a scratch on the wrist or firing a pistol in the air? Or if he accuses me of being a thief or a liar, am I the less guilty because I have pricked him in the arm?

The fact that the duel is useless and irrational, and does not fulfil its avowed purpose, is not, however, sufficient to cause it to be declared illegal, as is proposed by the draft law laid on the table of the French Chamber by the Abbé Lemire. In the first place, it is an assault; and assault and battery are illegal even if the parties consent, for the law protects individuals even against their own passionate impulses. It is likewise in direct contravention of the principle that no man has the right to take justice into his own hands. From a moral standpoint it is equally indefensible, because in nine cases out of ten it is an unequal contest, which gives the advantage to the practised swordsman or shot against the novice, to the young against the old, to the strong against the weak, the healthy against the feeble, and the possessor of physical courage against the timid. In fact, turn it about as we may, the duel stands condemned as a foolish and possibly dangerous anachronism from legal, moral, or common-sense considerations.

The draft law of Abbé Lemire suggests that duelling be made a penal offence, punishable by a small fine; his idea being that when it is merely a question of being mulcted in a trifling sum the duel will die out from ridicule. There may be some ground for this conclusion; but it seems more probable that the sort of men who fight duels to-day, when it costs nothing, will not be deterred by a five-pound note of costs. The ideal law would be one imposing enormous fines or long imprisonment, for many a man who will take an infinitesimal risk of having a hole drilled in his skin will decline altogether the same certainty for his pocket. A practical law would provide for a court of honour or damage, sentimental or material, and issue sentences to be carried out by an official *ad hoc*. For example, when A. writes a scurrilous article about B. which nobody believes, the damage done to B.'s honour or position is small. Nevertheless, feeling aggrieved, he prosecutes A., who is sentenced to receive a wound in the shoulder sufficient to keep him in hospital for a month, with the alternative of paying fifty pounds fine. The wound would be scientifically inflicted by the State doctor or else the money

would be paid. In more serious cases the court would decide even up to death-penalty, failing possibility of reparation, or else very heavy compensation or long terms of imprisonment; and to make the law more effectual, the seconds should also be severely punished in proportion to the principals by fines and imprisonment in case the code is contravened and a duel fought instead of the case being referred to the tribunal. It is too much to expect any law approaching such a model in France; but, together with legislation especially directed towards preventive punishment, there is a crying need of new laws protecting the person and his honour. Putting aside the great mass of duels that are simply brought off for self-advertisement, a certain number are fought under stress of opinion as being the only conventional way of at least partially clearing a reputation; and these arise merely because the French Code and French magistrates punish severely offences against property, but do not in any adequate degree protect the person. A trifling theft brings with it a month or two in jail; but the most abominable verbal or written insults are only deserving of a fine of a pound or two, and even to obtain this the injured party has to contemplate the endless intricacies of months of procedure, and to face the often insulting examination and pleadings of counsel. Consequently a Frenchman, if insulted in a manner which it is impossible to pass over in silence, has either to swallow the injury or have recourse to the duel, and of the two he generally chooses the latter, miserable as may be the satisfaction it affords in the best of cases. Recourse to the courts is not even thought of, because it would be considered tantamount to 'swallowing' the offence; and it will always be so considered as long as the legislature remains in its present ineffective state. If, as in Britain, offences against the person were punished by heavy pecuniary fines and imprisonment, duelling would soon end, for it has been seen that wherever personal rights are powerfully protected the duel has ceased to exist, whereas it has always defied repressive laws. With the ticklish 'sense of honour' that has grown up in France it is certain that no ordinary law like that of Britain could meet the majority of cases that give rise to the duels of to-day. For these special Courts of Honour should be formed by the Syndicates of Literature, Press, Drama, &c., such as have long been in practice in the fencing-schools. Such courts would relieve the ordinary magistrate of the difficulty of deciding where and to what degree honour was touched. As the limits of honour vary widely according to different strata of society, complicated and delicate questions would often arise. But the French judge has perpetually to deal with almost, if not quite, as difficult and delicate questions, and gradually the competent courts, with adequate laws to administer, would probably be found quite up to the standard of their work in the majority of cases. It is necessary, however, to add that sometimes circumstances arise with which no court could deal to the satisfaction of the aggrieved parties, and in which they could not themselves apply to a court without inflicting greater damage on their own feelings. In such circumstances, and in such alone, is the duel not only justifiable perhaps, but the unique solution possible.

Englishmen who find themselves placed in positions like these seldom hesitate to offer to foreigners such satisfaction as the duel affords, or to claim it from them on foreign soil, since our own laws forbid the practice. I cannot better illustrate such situations than by relating one or two cases in which personal friends of mine have been engaged, and proved that duelling may have its good sides.

In the winter of 188– I was dining at Shepheard's Hotel, Cairo, with two Austrian and Hungarian noblemen and a high Egyptian official amongst the guests. A British officer at another table indulged in silly jokes at the expense of the Pasha. When we rose the Hungarian followed the offending officer and handed him his card, which, however, was simply thrown on the floor. Crimson with rage, he sent two friends immediately to demand an apology, but was met with a blunt refusal to have anything more to say or do in the matter. In the evening he went round to the Opera, and, entering the box of the British Minister, Sir E. Malet, bowed low and begged to congratulate him on the sense of honour displayed by the British army. About midnight he was stalking up and down the famous balcony of Shepheard's Hotel reviling the British, when a young fellow employed in a bank went up to him and struck him on the face. The Baron was not only a noted duellist, but a man of herculean strength, and he at once knocked his assailant down before they could be separated. He now vowed that no man who had hit him could live until at least he had stood up to his fire; but the Englishman declared that he would fight him with fists even if he were pounded to a jelly, but would not be shot. The Baron's fixed resolve was thenceforth to shoot him at sight, and it became necessary to remove the young man from Cairo, since, had the threat been carried out, as it doubtless would have been, the Baron would only have been tried in Hungary by a jury of his peers, and either acquitted or sentenced nominally to a short term of confinement on his own estates. In the matter of the officer, a jury of honour was formed, which decided that reparation should be offered; but the consular authorities stepped in and also removed the soldier, who, I believe, was shortly afterwards cashiered, though not ostensibly or only on account of this business. I was very nearly fighting the Baron myself, although he was a good friend of mine and an excellent

fellow; and when I asked him what he would have done if his first challenge had been accepted, or if any one else had taken it up in the ordinary way, he replied that he would have fired in the air or else aimed loosely at the arm, and then have shaken hands. As it was, through the refusal of one Englishman to fight, every Britisher in Cairo was exposed for weeks to insulting remarks, and a passing stigma was inflicted upon national honour and courage. This was a case in which motives of policy and international honour imperatively pointed to the opportunity of fighting, absurd and trivial as was the original cause.

To take a very different case. An Englishman had been mortally offended in his family affections by a foreigner, who fled the country. He followed him for weeks all over Europe, and at last succeeded, with the full approval of the authorities, in bringing the culprit back as his prisoner. A duel was arranged, according to the conditions of which the two were to be put up at twenty yards distance, and on the words 'One, two, three—fire!' either could fire at will, advancing on the other. It may be prefaced that the Englishman, whom we will call X., was an extraordinary shot with a pistol, and could pick out the ace of hearts once in three times at twenty yards, whilst Z. was unused to firearms. The meeting took place in the depths of an ancient forest, a very different venue from the Grande Roue of Paris, and I was reminded of the contrast when MM. Rip and De Flers fought in February 1911, with six photographers and a kinematograph operator perched on the palings surrounding the Velodrome, and a cloud of newspaper reporters making jokes on the appearance and gestures of the principals. Here there was no laughing and no fun, but all were in deadly earnest—the Englishman cool and collected as if he were at his writing-desk, the foreigner in an ecstasy of terror. At the word 'Fire!' the latter pulled the trigger and the bullet flew wide overhead. X., after deliberate aim, raised his pistol and fired in the air. A second time the word was given, and Z.'s bullet ripped up the grass and dead leaves to the left. X. advanced to within a yard of his adversary, and again fired in the air. The tension was now painful, as all felt that the end was not far off. In reply to the seconds X. merely said, 'I have given him his life twice. He knows what he has to do if he wants to save it, for I shall not let him off again.' And the wretched man, who was by this time a mere rag, agreed to the terms he had been offered from the first. No law-court could ever have forced him to the reparation made, and the method chosen by the Englishman was the only one open to him. Here again was the utility of the duel proved.

Yet one more instance of recent date. A foreign officer had been grievously wronged by an English soldier, and considered that nothing but his death could wipe out the offence. The foreigner had already killed one opponent, if not two, in duels, and had the reputation of being an unerring shot and merciless antagonist. It was impossible for the duel to be fought on the spot, and to avoid all scandal it was arranged that the two should meet in a distant capital a month later. The Englishman did not hesitate an instant. According to his idea, it was a debt of honour that must be paid on demand, and he refused all attempts to save him from what his friends believed to be certain death. Bravely and gallantly he faced the risk, and Providence was kind, for he escaped with only a comparatively slight wound. By his action he saved many others from possibly lifelong consequences, and upheld the reputation of the Englishman for true courage and a sound and real sense of honour, which must take into consideration the opinions of others, and not invariably decline to fight on the ground that it is against the law.

From these three little stories I think it will be admitted that circumstances may occasionally force a recourse to the duel; but such cases are comparatively rare, and can scarcely be taken into account in a consideration of modern duelling as practised in the twentieth century. A typical illustration of the duelling code was the case of M. Bridge, manager of the theatre Bataclan, who recently published an article that was considered offensive by M. Arnyvelde, and received his seconds. But a short time before M. Arnyvelde, for reasons of his own, after naming seconds, had refused to fight another adversary. The result was a *procès-verbal* of *carence*, or disqualification in honour. Consequently M. Bridge cannot fight with M. Arnyvelde unless he is prepared also to fight with the former adversary and both his seconds, all of whose honour was offended without satisfaction by M. Arnyvelde's declining to go out. Rubbish of this sort daily appears in the Press merely as an advertisement of the parties concerned, about whose honour the public cares not a fig.

Perhaps the most stinging satire on duelling ever perpetrated was when the actor Dugazon (1745–1809) was called out by a monstrously fat opponent, Des Essars. Dugazon had written a bogus letter to the king in the name of Des Essars, asking for the place of the lately deceased elephant in the Jardin des Plantes. When they met Dugazon took a piece of chalk, and drawing a circle on the portly waist of his opponent, declared that 'all hits outside it should not count.' But it would take a volume to relate the ridiculous and tragic happenings connected with duelling in France. Enough has perhaps been said to allow the reader to form his own opinion, and to follow with intelligent interest the future debates in the French Chamber on Abbé Lemire's motion for making duelling a penal offence.

THE BANDIT AND THE LADY.

CHAPTER V.

'I have done many things of which I am proud, signore, but of nothing am I prouder than of the quickness with which I smeared my paper with the paste, stuck it upon the glass, and cut out the whole panel.'

'That tells of a bad experience, Beppo Cavalanci,' said Tredare.

Cavalanci shrugged his shoulders. 'Alas! it does, signore; but here I used my bad experience for a good purpose. In a few minutes,' he continued, 'the glass was cut, and there was a hole big enough for two men to get through abreast.

'"Come, Illustrissima!' I whispered, "there is not a moment to lose."

'But the shrouded figure, which I now saw more plainly, did not move.

'"Come! come!" I whispered; "we may be found at any moment. Have courage! There are horses and *carabinieri* outside the gate."

'"I am lame! You must help me!" The whisper was so low that I could scarcely hear it.

'"Then I will lift the Illustrissima," I said, stooping into the opening and holding out my arms. The black figure moved quickly towards me, so quickly that the veil slipped from her head to her shoulders, and I saw her face. It was the Princess's attendant, her evil eyes blazing with malice and fury, and a long dagger in her hand! In my surprise, I stood upright, and this saved my life, for at the same instant the woman made a downward lunge with the dagger, which must have pierced my neck through and through. She struck so furiously that, missing her aim, she overbalanced herself and fell full length upon the floor. Before she had time to stir I had leapt over the wooden partition of the door and my hands were round her throat.

'"If you make a sound I will strangle you!" I whispered. She was stunned, I think, by the fall, for she made no resistance, and of this I was glad; one does not like to hurt a woman, even such an evil creature as this. I made a gag with the black veil and secured it round her mouth; there were curtains on each side of the door, looped back with cords, and with these cords I tied her hands and feet.

'Beyond the circle of moonlight, close to the door, all was blackness. I struck a match, and found myself in a vast hall, bare of all furniture save for a long marble table against a wall, and on this table stood a candle. I lighted it. The woman moved her head furiously, trying to free herself from the gag. I bent over her, and made the fastening more secure. But, oh, the fury and hatred in those evil eyes of hers!

'There were doors on both sides of the hall, but where was the Princess? Where should I find her? Time was pressing.

'I took the door to the right and passed from room to room, each communicating with the other, and each most gorgeously furnished—the Prince had certainly made his wife's prison a bower of luxury—until I could go no farther. There was no second door in the last room, and I knew that I had reached the end of the apartments. The Princess, therefore, must be in one of the rooms on the left-hand side of the hall, and I quickly retraced my steps. The woman had rolled herself across the floor, and was rubbing her face against the wall, trying to get the gag from her mouth in that way. There was an artful wretch for you! I had come back none too soon, for one side of the fastening I had made by twisting the veil was already worn through. Cursing her for making me lose such precious minutes, I fastened the gag still more securely, and darting into the next room, seized a large piece of brocade which I had noticed thrown over a sofa. I rolled the woman over and over in this until she looked like a giant baby in swaddling-clothes, and then with more curtain-cords I bound the covering round her ankles, her waist, and her shoulders, and then tied her to one of the legs of the marble table.

'But all this had taken time, and the great clock boomed the hour of one. Frantically I opened the door on the left side of the hall, and again I passed from room to room hung with tapestries and brocade, and filled with rich furniture. In my fear and haste I forgot caution, and hurrying through each room, I opened the communicating doors without any care for sound. At last I found myself in a vast saloon. There was an open piano with music littered upon it; near by was a woman's work-table; an empty coffee-cup stood upon a console; there were books and papers littered about. This, then, was the Princess's sitting-room; her bedroom could not be far off. But there were three doors leading out of this saloon. I opened two of them, but my candle showed me empty rooms with no doors of exit. The third door, then, must be that of the Princess's bedroom. I knocked; twice, thrice, I knocked. There was no answer. I opened the door, and, oh, signore! I had found the Princess! She was lying fast asleep in a great golden bed with carved pillars and brocaded canopy, her dark hair streaming all over the pillows.

'I did not dare to enter. "Illustrissima! Illustrissima!" I said over and over again, my voice rising louder and louder; but she did not stir. Then I, Beppo Cavalanci, the proscribed, the outlaw, was forced to enter the sleeping-chamber of the Princess della Gravina. I shook her gently by the shoulders—she was a deep

sleeper, the Princess—but at last she awoke, and, seeing me, gave a muffled cry. For a second she stared at me, her beautiful eyes set wide with fear. Then a look of pride and contempt came over her face.

'"So it has come at last!' she said. "He has sent you to kill me!"

'"I do not come from the Prince, Illustrissima," I said. "I come to save you! I come from the police at Naples, because of the story told by your maid Maria. You found my letter beneath the watering-can yesterday?"

'The Princess looked puzzled. "Letter? Watering-can?" she said. "The garden-door was locked all day yesterday. I could not go out."

'"Then the Illustrissima did not throw the envelope over the wall as the signal I asked for?" I cried.

'"I know nothing of any letter or signal," she answered.

'"Then that daughter of the Evil One, the woman who attends on the Illustrissima, took that letter of yours and gave me the signal."

'"She cannot read," said the Princess.

'"But she has a husband," I answered. "He is ill with fever, but he can read."

'I saw it all as clearly as if the words had been spoken to me. The woman had seen the steward and myself go into the garden; she had watched, and had seen my visit to the cistern. She had found the letter, and had taken it to her husband to read. It was she who had given me the arranged signal; and shrouding her face in a veil, she had stood within the door to make me think the Princess was waiting for me. If her dagger had achieved her object, my dead body would have been the ruin of the steward. He would have paid dearly for his assumption of authority. The woman's humility to him that morning was now explained. She knew she had his downfall in her hands.

'All this, and the open field for escape, I explained to the Princess as quickly as my tongue would go. When I had finished she put out her hand.

'She was so beautiful, and her face was so sad, that I fell on my knees by the bedside and kissed that little hand.

'"I trust you! I trust you!" she said. "Your heart is in your voice."

'The Princess lighted two candles standing on a table close to the bed. "Wait outside the door," she said. "I will come to you as quickly as I can."

'"There is no time to be lost, Illustrissima! Put on anything and come at once; the wife of the commandant of the *carabinieri* will give you all you need;" and, saying this, I went into the saloon.

'One of the windows was open, but the jalousies were closed, and through them came a muffled sound. I listened intently, then threw the jalousies wide and leaned out. The sound came from the direction of the gateway, a confusion of cries and heavy hammering. Heavens! there could be only one cause.

'"Illustrissima," I cried, "you must come at once! The guards are breaking down the door!"

'She was brave, the Princess! In an instant she came into the saloon, with a cloak around her, and holding a pair of felt slippers in her hand. She put them on her bare feet, and we hurried through the long suite of rooms. When we reached the hall I held the candle high above my head, and we both looked at the brocade bundle tied to the leg of the marble table. Only the women's eyes showed, blazing with rage and fury.

'I lifted the Princess bodily over the wooden portion of the door, and carried her in my arms down the staircase. The cries of the guards and the heavy, dull thuds upon the door were now clear and distinct. The Princess shivered in the night air.

'"We must run for it, Illustrissima," I said, as I put her down. "The door is strong, but there are four strong men behind it!"

'She put her little hand in mine, and we ran like deer down the path to the garden-door, the cries and hammering sounding louder and louder. Scarcely had we passed through, when a piercing shriek came from the castle. The Princess stopped and gripped my hand.

'"What is that?" she gasped.

'"That fiend has got her mouth free, but she is too tightly tied to stir," I answered.

'Only the three spring-locks on the great outer doors lay between us and safety. The noise in the dormitory was that of evil spirits in torment, and as we sped past the door one of its panels splintered and crashed under a heavy blow!'

Cavalanci drew a deep breath. 'Never shall I forget that moment, signore! A second blow sent the splinters flying and made a hole in the door. One of the guards looked out and saw us. There were loud yells, more blows upon the door, and, ringing above all, the ceaseless shrieks of the woman. In the gateway it was so dark that I could not see the locks. I struck a match and turned the first key. Then that brave woman snatched the match from my hand, and held it whilst I turned the two other keys. I dragged the door open a little way, and the Princess slipped out.

'I looked at the dormitory door; the hole was larger, but still the stout old wood resisted. The Princess returned and seized my hand.

'"Come! come!" she cried. "The door will be down in an instant!"

'"Strike a match, Illustrissima," I said, giving her the box. "We can save ourselves a sharp run."

'She obeyed me instantly. In oiling the three locks I had observed that when the keys

were removed the wards were released. By the light of the flickering match, and with the cries of the men, the shrieks of the woman, and the crashing of the door making an *inferno* all about us, I drew out each of the three keys. As I drew out the last one the dormitory door burst in halves, right down the centre, and the guards rushed out. In a flash the Princess and I were outside the great door and I had pulled it violently after me. It closed with the bang and rattle of a great gun, and we heard the locks snap into their sockets; and, signore! I held the three keys in my hand! The guards were themselves prisoners!

'The rest was very simple. The *carabinieri* were waiting at a short distance from the castle, and within an hour the Princess was safely sheltered in the house of the commandant and his wife. Three days later she was in Naples.'

'What happened?' asked Tredare eagerly.

'The Prince della Gravina died very suddenly, signore,' Cavalanci said meaningly.

'By his own hand?' There was a note of horror in Tredare's voice.

Cavalanci nodded, saying, 'But it did not appear so on the death-certificate, signore. It was the only thing he could do. And that,' he added, with a sigh of profound content, thrusting out his legs, 'is how I rescued the Princess and so gained the *velo d'oblio*.'

There was a long silence. The mountains loomed purple and black through the clear Southern night; far away down the valley an owl was hooting. Tredare felt that he was in a world that had slipped back two hundred years. He was roused from the amazement and excitement of the ex-bandit's story by the sound of wine being poured into a glass.

'Let us drink to the health of the noblest and most beautiful of all ladies,' said Cavalanci, 'the Princess della Gravina! It was she who bought the inn for me.' The two men drank the toast standing.

'Tell me one thing,' said Tredare a few moments later, as Cavalanci, after lighting the candles, was leaving his bedroom. 'Tell me, why did you not escape when the police set you free to rescue the Princess?'

Cavalanci's eyes opened wide with surprise. 'How could I escape?' he said simply. 'I had given my word of honour to the head of the police.'

'Then if you had failed to rescue the Princess you would have returned to the police, although you knew the *ergastolo* could be the only end?'

'Of a surety, signore. What else could I have done?'

Tredare put out his hand. Cavalanci grasped it warmly. 'Perhaps the signore thought a robber could have no word of honour,' he said with grave simplicity.

Tredare had just got into bed when the door opened and Cavalanci's head appeared.

'Perhaps the signore would like to know what I did with the three keys of the castle gate?' he said, his flashing teeth displayed in a broad grin. 'I sent them to the steward at his house in the town early the next morning, with these words on a scrap of paper: "Those who are responsible to great princes should beware of the clatter of women's tongues!"'

THE END.

THE MONTH: SCIENCE AND ARTS.

A WATCH THAT TELLS THE TIME IN THE DARK.

A DISTINCT novelty in regard to timepieces which has recently appeared upon the market is the Bravington 'radium' watch, the peculiar feature of which is that therewith it is possible to read the time in the dark. Residents in the country, travellers in foreign climes, and even those dwelling in towns and cities, are fully cognisant of the troubles incidental to ascertaining the hour of the night in darkness, and the hunt for matches, which in itself is an exasperating difficulty, and one which is not always successful. Hitherto the only method of ascertaining the time under such conditions has been by means of a repeater, but such watches are very expensive. The new watch, however, is distinctly one for the masses, being nominal in price, and it has the distinct advantage of being a much simpler and easier means of conveying the desired information than the repeater. The watch is a neat little piece of work, two inches in diameter, and very thin and light, so that it fulfils the requirements of a small, light accessory to the pocket. The dial is illuminated, not in a general manner, but by means of round dots composed of a material which emits a phosphorescent glow in the dark, and placed above the indicators of the hour, the hands likewise being covered with this material. The twelfth hour is indicated by two dots, one above and the other below the Roman numeral, so that it is impossible to read the time erroneously. When the watch is examined, the hour-dots, one-sixteenth of an inch in diameter, stand out brilliantly, together with the hands; consequently the time can be ascertained at a glance. The illuminating material is claimed to be of a permanent character, is not affected by dampness, and retains its luminosity under all conditions. In fact, it may be stated that the watch will tell the time in the dark so long as its mechanism keeps going. If desired, the watch can be obtained fitted with an alarm, placed inside, which can be set to ring

at any time like the ordinary alarm-clock. In this case the watch is about twice as thick and heavy as the one already described. Travellers will appreciate such a watch, for it overcomes one of the greatest difficulties when they are encamped in the wilds, where maybe the search for matches has to be prosecuted in the depths of a sleeping-bag; and even when discovered, these often refuse to strike owing to dampness, as the writer can testify from experience. It is also an excellent timepiece for the bedroom. The idea might be profitably extended to larger horological works with much advantage, for it certainly supplies what has long been a felt want, and constitutes one of the most ingenious and useful developments in the watch that has been effected for several years.

THE MELOGRAF.

This is the age of the mechanical piano-player, but one great disadvantage to the universal adoption of this particular musical instrument has been its high cost. A Swedish inventor, Mr J. P. Nystrom, has recently devised an instrument of this class which he calls the melograf. This apparatus is built into the piano in the usual manner, leaving visible only the roll of paper in which the notes are cut. It is impossible to describe the design and features of the apparatus without the aid of illustrations; but its scope and operation may be readily understood. In the first place, any one can make his own notes for recording at will. The roll of paper intended for the receipt of the record is covered with a wax-like skin. Electric wires run from the keys to knives which, when keys are depressed, are brought against the paper, and cut lines similar to those produced by the stylus in making a talking-machine record, the only difference being that the lines are straight instead of being in the form of a spiral. The notes are recorded upon the paper the instant the key is depressed. Directly the record is obtained one is able to reproduce the result. The roll of paper is placed upon a shaft, while every key on the instrument carries a small projecting peg. These latter coincide with the record-line upon the waxed paper, and when the instrument is started an electric contact is established between a line and its corresponding piano-key, which is depressed. The lines on the record vary in length as well as depth, so that an absolutely correct interpretation of the piano-score is obtained. Another notable point is that if a mistake should be made during the preparation of the record, the error can be corrected as easily as a photo can be retouched. The combined machine for recording and reproducing costs fifty pounds. If reproduction only is desired, such as in the case of the ordinary piano-player, the reproducer costs twenty pounds. The cost of recording, also, is trifling, a complete opera being secured for an expenditure of fifteen shillings, while an ordinary pianoforte waltz can be obtained for about two shillings. The invention should be of great value to composers, who are thus enabled to obtain very quickly a record of any improvisation. Another attractive feature is that the record is played quite automatically throughout without any human aid whatever, so that it is really more perfect in its operation than the ordinary mechanical playing system, all expression and inflection being carried out by means of the record itself, even to the manipulation of the pedals.

FRUSTRATING THE THIEF.

The prevalence of thefts of valuables during recent years has stimulated inventors toward the evolution of some means whereby the efforts of the depredators might be effectively frustrated. Success has been achieved to a unique degree in the 'trusty' alarm-box. This little acquisition can be used for protecting cash, my lady's jewels, or other valuables either during transit, at home, or in the office, and it defies illicit removal without giving loud warning of the fact. It is made of steel, and is fitted with the well-known Chubb safety-lock. Each box is numbered by the manufacturers, who retain a register. After the box has been deposited with its valuables, say, in a railway-carriage, the alarm is set by the owner before he goes away. When the sneak-thief prowling around the departing railway-train takes up the box he instantly starts the alarm, which is so loud as to arrest the attention of those standing around; and even if he reaches the street he is unable to make good his escape, as the alarm continues to issue its warning for six or eight hours. So skilfully is the system perfected that if the box is used as a paper-weight upon the table, the removal of a sheet of paper from beneath it suffices to set the alarm in motion. The setting of the alarm is absolutely secret, and once it has been set and the box is touched the alarm will continue to emit its notice of disturbance until the owner, who alone knows the method of its setting, appears upon the scene. It is undoubtedly a novelty, and it offers the most complete protection against the theft of cash and valuables that has yet been devised. The box is made in a variety of sizes to meet different requirements, from the conveyance of diamonds to the carrying of deeds; and the fact that it is used extensively by those accustomed to the storing and transportation of valuables, such as banks and railway and steamship companies, is sufficient warranty of its efficiency.

A NEW FOUNTAIN-PEN.

The fountain-pen has entered so extensively into our complex commercial and social life as to be considered indispensable. Yet this familiar instrument suffers from various drawbacks, the

greatest of which is the necessity of carrying it in a vertical position to avoid the discharging of the contents of the reservoir into the pocket. Last year the writer had occasion to wander in the wilds of north-western Canada as the member of an exploring-party, and the object most in demand among the members of the expedition was a small Swan stylograph. This barrel of ink, which fitted flatly into the pocket, occasioned considerable interest and curiosity among the Indians, who were astonished to see such a small device capable of writing indelibly, and yet only occupying two inches of space. A fountain-pen of the ordinary type under such conditions would have been lost within the first twenty miles among the fathomless forests, as it would have been jerked out of the pocket; but this little instrument, lying flat in the pocket, defied removal. Recently the manufacturers of the Swan fountain-pen have gone one better. Instead of a stylo, they have fashioned an ordinary fountain-pen which lies horizontally in the pocket without permitting a drop of ink to escape, and this is undoubtedly the greatest boon that has been placed within reach of the traveller and explorer, who when on the trail cannot pay such close attention to essential details as the city man. To carry a fountain-pen vertically when struggling over fallen trees is certain to bring about its loss. The new fountain-pen is safe against such mishap, while the ink cannot escape for the simple reason that the cap screws into position, forming an airtight chamber. Concurrently with the perfection of this writing instrument, the manufacturers have devised a new and clean way of filling the fountain-pen. The bottle of ink is provided with a dome-shaped india-rubber cap having an orifice at the top. The point of the pen is forced into this aperture, and the ink-bottle is inverted and moved up and down about a dozen times, acting as a pump. The result is that the pen becomes charged with ink. The bottle is then restored to its original position, and not a drop of ink is to be found except upon the nib. Such a simple and clean method of refilling the pen is certainly excellent.

PREVENTING MOTOR-CAR SIDE-SLIP BY THE GYROSCOPE.

Side-slipping still remains one of the greatest dangers of motoring, and although various expedients have been devised to avoid this contingency, little success has been achieved up to the present. The gyroscope has now been pressed into service for this purpose, and it must be admitted, from the results of experiments, that it has proved the most effective and business-like means of eliminating this danger. In order to prevent side-slip, which overtakes the driver unawares, it is essential that a system should be automatic in action, effective on any kind of road surface, possessed of long life, and of such a character as to avoid wear and strain on wheels and tires. The application of the gyroscope to this peculiar problem was only to be expected owing to its capability of maintaining equilibrium on the line of travel under all conditions; but the question to be solved in regard to its adaptation to this requirement was beset with peculiar difficulties. However, one inventor, Mr A. Rutt, applied his ingenuity to the subject, and has devised a simple and ingenious apparatus which can be applied to any car. It comprises a wheel having a heavy rim, mounted in a flexible manner upon a central axle such as the shaft of a motor, so that it can be tilted in any direction at an angle to its axis. As is well known, the tendency of a gyroscope is to maintain its position at right angles to its axis, and accordingly when the axis is disturbed it will strive to restore it to its original position. No amount of effort will induce the gyroscope to deflect in the direction of the application of force. This accounts for the successful manipulation of the torpedo, the maintenance of a car upon a single rail, as in the Brennan railway, and so forth. In its application to the motor-car the gyroscope is mounted at a convenient point upon the shaft of the engine, either in front of the bonnet or inside it between the radiator and the front of the motor, according to which position is the more convenient. When the gyroscope is running and the car shows a tendency to slip, in which action the front wheels remain stationary and the back wheels describe an arc to this pivot, the gyroscope helps to keep the back wheels in the direction of travel set by the steering-wheel by counteracting their attempt to slide to the right or left about the front wheels. The gyroscope non-slipping device has been subjected to many exacting tests, but has established its capabilities to overcome skidding in a very pronounced and satisfactory degree.

THE READING CAMP ASSOCIATION.

An organisation which is deserving of support has been formed in Canada for the express purpose of improving the lot of those who toil on the uttermost limits of civilisation, either in the task of sending forward the railway, obtaining lumber for the world's needs, or in prospecting and so forth. Unless one has ventured, like the writer, into the heart of the Canadian wilds, one cannot have the remotest idea of the condition of the toilers. When they have completed their daily task time hangs heavy on their hands. Being far removed from civilisation, they are denied the enjoyments which enable most people to spend their leisure moments profitably, and the greatest dearth is in regard to reading material. The men have to devise their own ways and means of passing the tedium of idleness. When the writer was in some of these camps all the gold

in their pockets would have been given for an hour's perusal of a magazine or book. This want was realised some twelve years ago by a number of gentlemen, and accordingly they set to work to find a remedy. The Reading Camp Association, having its address at 16A Aberdeen Chambers, Toronto, is one of the many institutions for the alleviation of human disabilities deserving of encouragement. This organisation, by the distribution of magazines, books, talking-machines, and other devices of profitable amusement, works admirably for the improvement of the life of the frontiersmen who are straining to develop the resources of the Empire. It is assisted in its beneficial work by Earl Grey, who probably knows the loneliness of the wilds better than any Britisher, and is consequently warm in its support. The method of the organisation is to despatch an instructor, usually a college graduate or undergraduate, to a camp, where he works with the men during the day and amuses them during the evening, while on Sunday he fills the rôle of minister to their spiritual welfare. The association started with three instructors; to-day it has thirty clever students working at every description of camp labour—cooking, running donkey-engines, track-laying, skinning mules, building dumps, swamping, and drilling, and entertaining the men during the evenings with books, lectures, music, and so forth. These men are not missionaries in the usual sense of the word; they are in advance of these worthies, working as members of the gang during the day for a wage, and assuming control of the amusements in the evening. The healthy moral tone of the Canadian frontier camps to-day is largely due to the efforts of these enlightened toilers, and the fact that their work is commended by the leading spirits of the undertakings upon which they labour affords ample testimony to its value.

A FOOT-REST FOR HORSESHOEING.

The operation of shoeing horses is appreciably facilitated in the south-west of England by a simple rest. It comprises two flat pieces of iron about eighteen inches in length, attached to one another at right angles in the form of a cross to form a support. From the centre of this foundation—that is, the point where the two pieces are connected—extends an upright bar of iron of about twenty inches in height, surmounted by a flat, circular head. In shoeing a horse, instead of the horse's hoof being nursed between the legs of the smith, it is held on the head of the upright, the smith standing on the rest to keep the stand steady and rigid. This ingenious arrangement was first introduced by a shoesmith in Cornwall, and has a considerable vogue throughout the county, as shoeing is thereby free from the fatigue characteristic of the old method. The advanced smiths, however, often effect the first stage in shoeing—the removal of the old and fitting the new shoe—by the usual practice, and rest the hoof on the stand to complete the task. The idea has been introduced into Bristol, but in this case the support comprises a small tripod. Smiths who have been converted from the old to the new method express complete satisfaction with the mechanical rest and the lessened fatigue and effort that attend shoeing. It certainly constitutes an easier and speedier means of accomplishing the end in view.

THE AMALGALINE JOINTING SYSTEM FOR PIPES.

The specifications of the majority of municipal authorities and architects demand that all connections in plumbing-work shall be effected with wiped lead joints, as this has been regarded as the most perfect method of accomplishing the desired end. In London, however, this practice is being superseded by a simpler and quicker system known as the amalgaline process. The new jointing material is a special metallic mixture made in the form of a ribbon five-hundredths of an inch thick. When a joint between two lead pipes has to be made, a length of this metallic material is laid between the cones to be joined together, the workman being provided with special tools by means of which the ends of the pipes can be coned to form a correct fit. The union of the two pipes is then carried out by fusion, a blow-lamp being brought to bear upon the amalgaline ribbon; and as the melting-point of this jointing medium is well below the fusion-point of lead, a perfect and intimate connection is effected between the two pipes without impairing them in the slightest. Joints formed in this manner have been subjected to the most severe tests, and, owing to the complete nature of the connection, the process is now permitted, in lieu of the usual wiped joint, by several municipal, sanitary, and water authorities. Not only is the joint thus completed in every way equal to the best class of wiped lead joint, but the work can be performed in much less time, and the result is far neater.

HOUSE-WARMING IN WINTER.

In connection with the recent description of the Carron anthracite stoves, by means of which a room can be kept at an even temperature at a cost of seven farthings per day, some misconception has arisen as to our suggestion that the process should be cheapened. So far as the stoves themselves are concerned, those manufactured by the Carron Company are unquestionably inexpensive and economical in consumption. The initial cost of such a stove compares very favourably with that of the ordinary grate, while the fact must not be overlooked that an anthracite stove will warm a greater cubical space than an open fire-grate of the same price. There are some very cheap anthracite stoves on the market; but it must be remembered that cheapness carries its own dis-

advantages, and the majority of fatalities that have occurred through this new system of warming the home have arisen from the use of low-priced, indifferently designed, and badly made stoves. The name of Carron is sufficient guarantee of the quality of the stoves issuing from this firm, and the writer can testify to their low initial cost and high efficiency in fulfilling the purpose for which they are designed.

SIR JOHN MILLAIS AND ARTISTIC ADVERTISEMENTS.

As much business is done in these days by means of advertising, skilled advertising is of great importance in many commercial undertakings. Clever, artistic advertisements tell in favour of any firm and attract attention. Mr Thomas J. Barratt, chairman and managing director of Messrs A. & F. Pears', is a past-master in this art. Sir W. H. Lever, who ought to know, regards him as one of the shrewdest advertisers of the time. The writer of the 'Romance of the Soap Industry' (*Chambers's Journal*, November 1911), in recounting some of his achievements, said the same, and quoted the statement given in Sir John Millais's Life as to the artist's anger at the use made by Messrs Pears of his picture 'Bubbles.' Mr Barratt informs us that this narrative is entirely incorrect, and gives in a letter we quote what actually passed between Millais and himself. He writes: 'I was sorry to read in the article on the "Romance of the Soap Industry" in the November [1911] issue of your magazine a repetition of the statement that "Millais was furious" at my use of his picture of "Bubbles," which is entirely contrary to fact, and is a reflection on his good sense. Indeed, he complimented me upon the use I had made of the picture, and hung a copy in his house after calling his wife to see it; and when I told him of the difficulties I had had in the past in inducing good artists to illustrate advertisements, he said, "—— nonsense, Barratt. I will do as many for you as you like;" and named his price. Unfortunately no others were done, owing to his untimely decease.' This is an absolute refutation on Mr Barratt's authority of the suggestion that Millais was other than gratified by the use which had been made of the world-wide known picture.

IGNORANCE OF THE ELEMENTARY LAWS OF HEALTH.

Miss Florence E. Campbell, B.A., head-mistress of Grafton High School, New South Wales, draws our attention to a little book which she and her staff have found of immense value to them as teachers. Our correspondent writes: 'In the June issue [1911] of your *Journal* reference is made to the sad want of knowledge with regard to the elementary laws of health which exists among so many people at the present day. We in Australia are fortunate in that there has been recently published an admirable little book entitled *First Aid in Bush Nursing* (Angus and Robertson, Sydney), by Mrs W. M. Thomas, formerly a nurse of many years' experience. Though primarily intended as a guide for those in the bush and country, this book is so simple, practical, and comprehensive that it would prove invaluable in any home or in any land.' What Miss Campbell says about the booklet seems perfectly true. We have no lack of similar handbooks here, notably a little book called *How to Keep Well*, by the popular lecturer, Dr Andrew Wilson (Chambers, 1s.); yet, in spite of free education and all the teaching from handbooks, the knowledge does not seem to have filtered down to the stratum of society where it is most required. The last report of the Chief Medical Officer of Health of the Board of Education showed a large proportion of children suffering from diseased conditions of various kinds, a considerable percentage from malnutrition or semi-starvation. Besides, 40 per cent. were suffering from decayed teeth, and between 30 and 40 per cent. were in a condition of personal uncleanliness. This betokens woeful ignorance of food-values, cookery, and health. It is commendable that such employers of labour as Messrs Rowntree, Cadbury, and others have social staffs for training girl-employees in domestic economy and the laws of health. Prevention is always better than cure, and this must begin in the first place in a higher standard of life in the home.

To Correspondents who wish fuller information regarding new inventions mentioned here, addresses will be furnished, when possible, provided a stamped and addressed envelope or post-card be sent to the Editor, 339 High Street, Edinburgh.

THE SHEPHERD'S HOME.

How oft, descending from the rugged hill
Where stormy winds were blowing wild and chill,
And night, with cloudy brow and dismal frown,
Upon the cheerless moors was sinking down,
Have I beheld, and gladdened at the sight,
Down in the vale the tiny twinkling light
That spoke of shelter, warmth, and kindly cheer,
And all I loved and all I held most dear;
The bright fireside, the brighter still, no doubt,
For the thick darkness and the blast without;
A haven of peace from life's tempestuous sea;
A bower of bliss from care and conflict free.
Oh happy he, where'er his footsteps roam,
Who thus to light, and love, and joy comes home!

R. H. CALDER.

*** TO CONTRIBUTORS.

1*st*. All communications should be addressed 'To the Editor, 339 High Street, Edinburgh.'

2*nd*. For its return in case of ineligibility, postage-stamps should accompany every manuscript.

3*rd*. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, *should have the writer's Name and Address written upon them* IN FULL.

4*th*. Poetical contributions should invariably be accompanied by a stamped and directed envelope.

Printed and Published by W. & R. CHAMBERS, LIMITED, LONDON AND EDINBURGH.

MOANING BAY.

By JOHN FOSTER, Author of *The Bernardine*.

IN FOUR CHAPTERS.—CHAPTER I.

THE border-land between daylight and the early dusk of a November in the North: a sunless day, gray and troubled sky, gray and troubled sea, and a nor'-west gale dying hard. For days the gale had bellowed round the Outer Hebrides; and now the lees of the storm, spent yet vindictive, made clamour on the shingle of a lonely beach. A dark fringe of seaweed marched with a reach of sand, its surface powder alive and dancing like smoke in the wind, running to the base of a great masterful knuckle of a cliff, a sombre headland on a little island, all around it the heaving girdle of the Atlantic. From the giant fist thrust thus defiantly into the surge there slanted to the north-east and southward the islet's coast-line, grim and relentless as any in the seven seas.

The beach was set in a scene of the very extremity of loneliness. Scarcely a single tree broke the gray of the sky and the gaunt profile of the cliffs. Restless clouds scurried across the lift, the horizon as murky as the sea it encompassed. Landward, no kindly farmhouse, no crofters' dwellings, could be seen, for the houses of the few islanders were in the 'bield' farther inland, out of the wind and the callous spindrift. In the distance to the north, hardly distinguishable in the falling dusk, rose the stem of a lighthouse.

The great voices of the place completed the sombre impression of that lonely and darkening shore. No cheerful music of ocean heartened the listener. The sea complained continually to the beach, breaking with sullen insistence on the shingle that muttered and roared as each receding wave wrenched at and strove with it. Round the headland the long rollers boomed with the despondent iteration of a minute-gun.

Another voice, arresting and mysterious, at times arose from the distance in a lull in the surf or the hoarse call of the beach; a sound of moaning, a sound indescribably mournful and despairing, the voice of Moaning Bay!—'*Camus a' Chaoidh*,' as the islanders call it; a little gap in the coast about two miles from the headland, its entrance a narrow channel sentinelled by the bared fangs of black rocks. There, every day and night when the nor'-west gale blew, a great high voice strangely like the cry of agonised humanity came down the wind. Travellers and other wise men explain that the cause of the daunting sound is simple; that a cleft in the rocks, narrow at its mouth, reaches up a cliff's face, widening there to a great funnel. Then the wind, when in a certain quarter, calls and sings and weeps down it. Just so it does down the chimney in the evening, when the world grows quieter, and the fire burns low and whispers; when the sensory perceptions are keenest, and visions and memories sad and fantastic are conjured up as one imagines the Spirit of Grief in the rise and fall of the voice of the wind that wanders for ever and ever over the homes of men. A mere trick of the nerves or the fancy! So say the dwellers in towns. But within sound of the sea, round the peat fires o' nights, the folk of the west have no such simple explanation. Indeed, no one knows if they have any, for they will never talk for long about Moaning Bay.

Looking down from the cliff on that November afternoon, the only marks of life visible, save the sea-birds, were a couple of specks moving slowly along on the sand below. The specks were a wandering sportsman riding a sturdy hill-pony, followed by a spaniel. The rider was one John Loudoun, a gentleman of leisure, with a love for the fascinating sport of shore-shooting. He was a keen ornithologist, an authority on the subject of wildfowl, and was a man possessed by a hatred of cities. He had means to indulge his tastes, his instincts and love of solitude leading him to become tenant of the shooting—good of its kind—that the islet offered.

Loudoun was tired. He had been out since morning, an absence of luck in the day's bag adding to his fatigue as much as the stiff head-winds and the tramp over the rough and pathless country. The pony trudged along slowly, its rider with his head down; 'Duke,' the dog, taking cover to the leeward, for the blown sand was stinging and the wind from off the sea keen and wintry. They went on for half a mile or more, when a welcome rock jutting out handily for two or three yards suggested a halt. Loudoun pulled up, dismounted, and fastened

 [*All Rights Reserved.*]

the bridle-reins lightly round a stone. Then he laid down his gun, lit his pipe, and rested; the three of them, man, pony, and dog, glad of the respite from the wind and spray. The spaniel sat down beside his master, eying him with watchful gravity. Man and dog talked for a minute or two, like the close comrades they were.

'I wonder how far we are from home, "Duke,"' said Loudoun; and, as if for answer, suddenly the great eye of the lighthouse opened, stared slowly from east to west and back again, a long flail of light, startling, spectral in the gathering shadows.

'Ah, there's the lighthouse! A good four miles from home yet,' said Loudoun, as he looked at the weird signal flashing its warning over the leagues of sea; a long, ghostly finger pointing into the darkening. Then the sound of the incoming tide arose, a great muttering growing every minute in volume and intensity to a thunder-roll, reverberating along the miles of iron coast. The man listened to it, shaping in his mind an image to fit its suggestion to him of some invincible supernatural force—the steady roar of a great unseen furnace, he thought. For a minute or two he lingered. Then he suddenly crouched behind the rock, for his quick eye had caught sight of a wedge of wild geese approaching. But they were high up, a faint arrow-head against the sky, palpably out of range; and he watched their steady flight into the gathering dusk without raising his gun. It was not yet too dark to shoot, and he knew that there where he stood was a favourite line for flighting. Therefore he made up his mind to rest for a few minutes longer, on the chance of any birds coming over. The wild-bird life around keenly interested him—gulls on heavy wing, oyster-catchers, ringed plover, a regiment of dunlin gyrating, skimming the sea, wheeling with marvellous precision, little auks fearlessly diving into the waves, the lightning swoop of a great gannet. However, nothing worth shooting came his way, and his thoughts turned to home, dinner, and a book in front of the glow of a peat-fire.

He got up and gave a last look around him before starting for home. He was not a very imaginative man, but some strange fascination kept him waiting and listening to the full-throated bass of the tide, and the ceaseless contradiction between sea and shingle. The great dark headland and the lowering sky, swept by the slow, regular gleam from the lighthouse—beyond its radius chaos and unutterable things—intensified the gloom of the place, the imminence of night, and his own isolation. Grave, questioning emotions stirred him as he lingered. Had there been any human companion with him, probably both would have gone on their way without spoken comment other than the exchange of a thought-concealing monosyllable, some hint of an undercurrent; for with Loudoun, a Lowland Scot, deep and moving thoughts froze speech. But alone, the scene gripped him. He fell into a reverie, watching the vast elemental forces round him; his mind groping around eternal problems — this little world — the Other Side. *What was that?*

He jumped to his feet. Above the call of the tide came, he thought, a long cry. Of course he knew the cause, he said to himself. Moaning Bay he was familiar with, but the illusion was so alive, so sudden, that he doubted his senses. He seized his gun and peered into the darkening; but there was nothing to be seen other than the charging tide now nearly at its meridian, and the capering gray shadows of the sand rising in quick spirals, collapsing suddenly, sprawling, writhing, to spring up again to their *danse macabre* in the wind. He listened eagerly, with an anxiety touching pain, for he was a warm-hearted man, and the cry seemed to him to have come from some man or thing in terror or danger. There it was again, a long, rising call of anguish, then a diminuendo, it seemed to him, in the desperate unmistakable note of death; some man, some thing, in the throes of a dire extremity. Loudoun made a speaking-trumpet of his hands and called with all the strength of his powerful throat and lungs into the night. There was no answer.

CHAPTER II.

A CAPFUL of spindrift struck him on the face, startling him into action. He passed swiftly round the rock, gun in hand, calling on the dog to follow. Half-a-dozen yards down the whirling sand he looked over his shoulder to see if the spaniel was in his wonted place at his master's heel. No dog was there. The little incident was strange, for 'Duke' was a model of fidelity and obedience. The man called again to him, with a touch of temper in his voice. But the dog did not come, and Loudoun caught a whimper from the rock that he had just left. He went back, and found the dog crouching close by the rock. 'Duke' lay stock-still, taking no heed of his master. The hair on his neck was standing on end, and the dog lay staring seaward into the darkness. Loudoun bent down and caressed him. The dog was trembling, palpably terrified of something, unable to move, and his master knelt down on the sand beside him, talking in reassuring dog-language. At the sound of his voice 'Duke' moved closer to him, still trembling, but never took his eyes off the darkness, and crouched down, his head on the sand, his hair on end, his little body in a paralysis of terror.

Loudoun, puzzled, tried to think it out for a moment, and turned to 'Donald,' the pony. It was standing with its sides heaving, its ears twitching. He went up to it, and laid a hand on its

neck. The hair was damp and cold. He passed a hand over its withers and down its sides. The beast was in a lather of cold sweat! It had not even strained at its tether, for the bridle-rein hung loose. Loudoun's practical mind suggested that dog or pony had been scared by some beast of the night, the uncanny infection of fear among animals spreading to the other one. He looked warily round. Suddenly the long cry arose again, this time nearer—almost, it seemed, close at hand. The pony reared wildly, broke its light tether, and wheeled, squealing like a mad thing, into the night; the man, angry and bewildered, listening to the scurry of its hoofs on the shingle growing fainter and fainter.

A sound made him turn swiftly. 'Duke' had risen, and was biting viciously at the empty air around him, now on one side, now on the other, avoiding something, leaping over it, then whimpering aloud as he gradually backed to the rock, his hair bristling, his teeth showing. There was something uncanny in the poor beast's frantic rushes, in the *snap-snap* of his teeth at the Thing he imagined. Loudoun held his gun in readiness, for he thought he had the solution. The pony, he concluded, must have bolted in the mysterious way of animals, some prescience telling it that the dog was going mad. There was a lump in his throat as he slipped a cartridge into the gun, for poor 'Duke' and he were firm friends. However, there was no help for it. There could only be one law for a mad dog. But the dog solved the question and saved his life by suddenly tearing homewards after the pony, and Loudoun was left standing by the rock, and, as he thought, alone.

He was of a practical mind, a man of excellent, well-kept, and trained nerves and physique; but there was something out of his experience, something baffling, in the animals' behaviour. He was vaguely uneasy.

He waited for a moment or two, angry with himself for his momentary weakness. There was no doubt, he told himself, that common-sense would right matters. It is so easy to label one's own view the common-sense one! The common-sense view and the commonplace are near relatives, and are often mistaken for each other. 'Duke' must have been going mad, and as he had solved in the poor brute's behaviour the cause of 'Donald's' stampede, his thoughts now turned to the cry he had heard or imagined. There lay his immediate duty—to do his best to succour the owner of the voice, if any such existed. A hundred chances to one, he said to himself, that it was the voice of Moaning Bay that he had heard, perhaps startlingly clear on a wind in the precise quarter for it; but his exacting humanity forbade the suggestion of leaving the spot with his conscience unsatisfied.

He went forward and shouted again into the night. Next moment the great arm of the lighthouse swung slowly round, pointing to the ocean. It came nearer, bathed him and his surroundings for a second or two of pallor, and then went slowly on to its deep-sea message, leaving the darkness darker. In that second Loudoun had started to run down to the beach, for he had caught a glimpse of some dark object close to the edge of the foaming sea. It took him but a minute to run full speed across the sand to the spot where he judged the thing to be.

The ebb-tide was running now, voluble and eerie in the darkness. He looked all around, and was about to shout, when his foot caught on something on a belt of seaweed. He bent down and stretched out an arm. His fingers grasped a cold, wet hand! He had looked on death often, and was no coward; but a cold chill ran through him as the long wail at that very instant rose again out of the sea. It seemed to him that the man moved. Loudoun struck a match. The light showed the face of a black-bearded man lying supine, his eyes open, his face deathly pale. A fragment of a torn jersey hung on him, leaving a muscular arm naked, and on it Loudoun saw tattooed an anchor, and below it the letters D. L. He felt the pulse. There was not the faintest beat.

'Dead,' he said; and, even as he spoke, the man half-rose to a sitting position and stared steadily out to sea. His rescuer felt in his pocket for his flask, and then remembered, with a curse, that it was empty. However, he would carry the poor soul out of the wind and the drenching spray, and then run to the lighthouse for help. He put an arm under him, and the man, apparently divining his intention, to Loudoun's astonishment rose to his feet and stood swaying. He was of great stature, capless, barefooted, dressed in sea-going clothes, dripping wet from head to foot, his naked arm hanging limp and broken, and the mark of an old scar from eye to chin on his left cheek.

'Feeling better?' said Loudoun, conscious of the ineptitude, for he had never seen any living man look worse.

The man showed no signs of hearing him. 'Listen,' he said in a strained, weak voice. 'Listen!' He pointed into the darkness. 'Listen! listen!'

Again came the cry. The man shuddered from head to foot. 'I hear them. I hear them, always!'

'Must have got a knock on the head on his coming ashore,' said Loudoun to himself. 'He's wandering, poor beggar!'—'Where did you come from?' he asked him eagerly. 'Was there a wreck?'

'A wreck? Ay!' He wrung the sea-water out of his hair, his great hollow eyes fixed on the darkness. '*The Western Belle*—she's there. Dinna ye hear them? I saw them!' he groaned. 'I hear them.'

Loudoun listened keenly, anxious if possible

to disentangle the man's message. The dripping figure was standing, guarding his eyes from the spray with his right hand, trying to pierce the gloom, a dreadful expectancy in his look.

'Come, gather your wits, man,' urged his rescuer. 'We may save them yet. There's a boat and a rocket at the lighthouse.'

'Save them?' The despair in the voice was tragic. 'Never! never! I took the wrong course, man. She couldna get to windward. We tried to lay her to. She's to pieces—out there. I hear them—always. I'll hear them for ever—for ever.'

Loudoun looked into the castaway's face. It was drawn and haggard as a corpse.

'Always!' the voice went on, the eyes fixed on the sea, never once resting on Loudoun. 'They may be near, thrown ashore wi' the tide—as I was.' He walked along the fringe of the beach, lowering his great height as he bent, searching eagerly. His broken arm swung loose and helpless, but he ignored it, as he scanned the dank line of seaweed.

'Better to have gone with them—Ailie—Donald!' he called. 'Nevermore. They are out there. I hear them. *Dhia! thoir maitheanas dhomb!*' and at the words he reeled and fell with a dreadful haunting cry of grief beyond words, a sound past tears.

Loudoun understood the Gaelic; knew that the cry was for forgiveness. He made up his mind quickly. The castaway was distraught, incoherent, a hindrance to action. He would take him to the lee of the rock, leave him there, and run to the lighthouse for help, although he guessed that any souls from the wreck were beyond the aid of men.

He thought of his gun, and ran back for it, to fire some shots in the hope that some one might hear them and bring help. He fired both barrels, reloaded rapidly, fired again, repeating this until his score of cartridges gave out.

Then he ran back to the beach. As he neared the water's edge the air seemed to thicken into a mist, opaque, damp, and choking. He dashed it out of his eyes and from his face, but in a moment or two it had enveloped him again. He was struck cold to the bone, although the wind had fallen with a strange suddenness. The stealthy wet hand of the fog sent a shudder through him. He struck his last match. It burned steadily for a moment and then instantly went out.

Near the place where he had left the castaway he called aloud, but there was no reply. The strange wall of fog for a moment blurred his vision. Then the wind rose in a gust as mysterious and sudden as its cessation of a minute or two before. The curtain of the haze melted as swiftly as it had fallen, and Loudoun saw that there was no one there! The beach was empty! Bewildered, he searched the place thoroughly. It was impossible that a wave could have clutched the man, for the spot where he left him was well beyond the sea's reach. Up and down, up and down, he spent a vain quarter of an hour in searching. Beyond doubt the castaway had vanished! Loudoun at last gave up the hopeless quest, and, holding his breath, listened, he scarcely knew for what. But there was silence, and he was conscious of a great sense of relief.

The gloaming had fallen into a night of black darkness. The wind had died again, and there was no sound but the sob of the sea.

(To be continued.)

'SOMETHING ROTTEN IN THE STATE OF DENMARK.'

By Professor HUGH WALKER, LL.D.

YES, 'something rotten in the state of Denmark;' and possibly something rotten nearer home than Denmark. In the earlier part of last century there was a general impression that science and mechanical inventions were going to bring the millennium. The essays of Macaulay are redolent of the conviction. The youthful Tennyson caught some gleams of this optimism; but, looking back 'sixty years after,' he saw half the triumphs of his morning staled by use and shrunk to the commonplace. With a troubled spirit beneath the light banter, Matthew Arnold jested at the boasts about 'our incomparable civilisation.' With processions of the unemployed scarcely vanished from our streets we may well despair of the millennium, and begin to wonder in what sense it can possibly be true that our civilisation is 'incomparable.' The achievements of science have been marvellous, human ingenuity has been prolific of invention, material wealth has grown enormously—and yet—and yet—— Where lies the disease? For disease surely there must be. While the majority would agree that some advance has been made, probably the most optimistic would hesitate to say that there has been improvement in the social condition at all commensurate with the growth of material wealth. Kingsley, who raised his voice for social reform in the middle of last century, twenty years later thankfully acknowledged a most beneficial change. But while the increase in material wealth is patent everywhere, while we can almost see the piles growing under our eyes, from time to time we receive some shock which momentarily shakes our belief that there has been improvement at all. Are not those processions of the unemployed almost enough of themselves? Whether it be thirteen millions of our population who are on the verge

of starvation, or only half that number, is there not evidence that 'our incomparable civilisation' has in some vital respects failed? It seems as if the phenomena were such as to deserve an examination more earnest, and above all more dispassionate, than we usually give them. To the man of robust political faith the thing is simple. If he is a Liberal, all that is needed is to get rid of a mischievous and obstructive House of Lords, and then a wise and beneficent Government will drop plums innumerable into the open mouths of an expectant people. The obstruction has been removed and the mouths are agape for the plums. If the politician is a Unionist, of course the shoe is on the other foot. What is needed is to get rid of the Government which causes bad harvests and ruins trade, to adopt Tariff Reform, and to float upon summer seas of prosperity to the Islands of the Blest.

But that is not the way of dispassionate investigation. Excellent for its own purpose as the party spirit is, that to which it points is not precisely 'the high white star of Truth.' Yet if the evils from which society suffers are to be reformed, that star is just what we must see first of all; and the trouble is that here in Britain every organisation dealing with the problems of society rapidly becomes political. Perhaps it is inevitable; perhaps there is no other way of handling the questions to good purpose. But, if so, it is disquieting. And, on the other hand, it is just possible that the British distrust of theory and of all merely speculative investigation may here be at fault. At any rate, the way of party is not the way of science. We do not hear of organisations of Radiumites and Anti-Radiumites. While men of science differ as to the qualities of radium, they go steadily on inquiring. They are willing to be convinced; but party supplies the convictions ready-made, and the art of the partisan is often the art of shutting his eyes till necessity forces them open. He who opens his before the hour of compulsion comes will probably see many things unwelcome to both—or to all—parties. He will see that both parties have been wrong in the past. Many changes have been made which the Conservatives denounced as ruinous to the country; and, though our condition is not ideal, the country is not ruined. On the other hand, the Liberal party has shifted its ground just as completely. What remains of the philosophy of the Manchester school? Who believes any longer that the whole duty of the State is to make a ring and let the economic forces fight it out?

If we try for a moment simply to *understand* the social structure of modern Britain, without attempting to pronounce judgment upon it, we see, in the first place, that we are a community in which agriculture plays a smaller, and in which manufacture and commerce play a greater, part than they ever played in the Britain of the past, or than they play in any other modern community of the first magnitude. The consequence is a great and growing concentration of population in large cities, and, on the other hand, a relatively sparse and declining rural population. The land of one of the busiest and most crowded communities in the world has largely gone out of cultivation. We see industries organised on an immense and a growing scale, and small industries gradually crushed out under stress of competition; and, along with this, we see a distribution of wealth such that a few have far more than they can use, while multitudes have nothing at all, and that, with the exception of a small percentage, those who work with their hands are permanently within measurable distance of destitution. Consequent upon this there arises a relation between employers and workmen which, to put it mildly, is not characterised by that friendliness and that conviction of a unity of interest which might be desired. Further, we see, as a constant factor in the community, a class of unemployed always considerable and sometimes dangerously large. Perhaps the saddest sight of all is that of children of tender years thrown by thousands upon the streets of our great cities to earn a living under conditions which almost compel them, in their maturity, to swell the ranks of the unemployed. They have learnt nothing for which any rational man would pay sixpence, and are unemployable. Finally, we see in consequence a condition of pauperism, not, it is true, as bad as that which prevailed before the great reform of 1834, but still disquieting; a condition, moreover, which has not in recent years shown any steady tendency to improvement.

When the dispassionate inquirer has reached this point, he may, perhaps, proceed to ask himself questions; and, having only his own reason and conscience to answer to, he will probably decide that not one of these features of 'our incomparable civilisation' is lovely, and that most of them are hideously ugly. The partisan, if he held a brief from the landed aristocracy, would probably at this point proceed to explain that the state of affairs is indeed unsatisfactory, but that the evil is in no measure due to a system of land-laws of ideal justice. If he were the mouthpiece of the capitalists, he might become dithyrambic over the immense volume of our trade and the unparalleled accumulations of wealth. If he were a member of the Labour party, it is quite possible that he might go equally far astray on another track—picture a class rich in all the virtues, but oppressed by inequitable laws framed in the interest of unprincipled men. He would ignore such damaging facts about the drinking habits of working-men as were recently stated bluntly by Mr John Burns. This is the way of assumption, of preconceived opinion, of squaring the facts with the party creed. But in all points it is diametrically opposed to the way of impartial investigation. That way is thorny and diffi-

cult, and its results are unwelcome to all parties alike. On the one hand, for example, it seems futile to deny that a different and more democratic system of land-laws might have done a good deal to keep the population on the land—a conclusion which would not be enthusiastically welcomed by the Conservative party. On the other hand, it seems no less futile to deny that, in spite of the confident assertions to the contrary seventy years ago, Free Trade has as a matter of fact thrown many acres out of cultivation. The dispassionate inquirer would decide nothing as yet. He would register these conclusions in his mind, but would remember that no question of the sort can be wisely decided without consideration of its bearings upon other questions. He has, however, put himself in a position to take an independent and unprejudiced view of two of the most important questions affecting our social condition.

In the same way he might go on to consider what has led to the organisation of industry as we see it at the present day; in what direction that organisation is moving; whether the condition of affairs, present and prospective, is satisfactory, and, if not, whether it is or is not possible to modify it. Here again the partisan would decide the matter, on the one side or on the other, with little difficulty. The inquirer would probably find that there was a good deal to be said on both sides. That is what makes him so unsatisfactory. He would have little hesitation in saying that the root-cause of the present organisation is machinery propelled by steam. He would see that the use of machinery neither can be nor ought to be prevented. Here the partisan of a certain type would close the discussion with a *Q.E.D.* But the inquirer goes on in his tiresome way. It is true that machinery is necessary and inevitable. It is true that, wisely used, it does great good. But it is *not* true that it does no harm. The crude condemnation by the older political economy of the workmen who opposed the introduction of machinery at the Industrial Revolution will not bear investigation. If the law of self-preservation justifies a man in fighting for his life, those workmen were justified. It is impossible to deny that the introduction of machinery is one of the causes of the loss of employment. The question of the duty of the employer who introduces machinery, or the duty of society at large, to the displaced workman is one which has never been adequately considered. Clearly he is no longer needed in his old place. Clearly it would be burdensome to the community, and demoralising to the man himself, to support him in idleness. But it is not quite so clear that the present system of throwing him overboard and leaving him to sink or swim—perhaps at an age when the chances of sinking are ten to one—is absolutely satisfactory. Surely it is eminently a case for investigation. The inquirer may well suspend judgment—another unpleasant way he has; it is so much more agreeable to hear the gospel preached without any 'ifs' and 'buts.'

The Royal Commission on Pauperism has presented results arrived at by this process of dispassionate inquiry. It is earnestly to be hoped that the report may not for that very reason be left in the pigeon-hole where it has, for the time at least, been put. But there is a danger; such reports are so frequently displeasing to both parties. The great report of the Commission of 1834, for example, would certainly not have pleased those who now pose as the champions of the poor; and there are few things they would have liked less than the evidence of the greatest, and certainly not the least charitable, man examined before that Commission—Thomas Chalmers. In this sphere again we have diametrically opposite views: on the one side, the assertion that 'it is all a matter of money,' a kind of quack salve which, if it is only spread thick enough, will cure this running sore of the body politic; on the other side we have the maxim of Lord Acton, a Liberal, but one of the old school: 'The remedy of pauperism is not the material resources of the rich, but the moral resources of the poor.' Which of these is true wisdom? Is the problem only how to rob a few hen-roosts more? Or must we face that hard and toilsome way which—so the gods have decreed—is not to be climbed without sweat? Must we attempt no less a task than that of moral regeneration? And is it possible still, as it has proved to be possible in the past, that the 'salve' laid on by a quack may cause moral degeneracy?

These are but a few of the many examples which will occur to the student of social problems, where strong reasons can be adduced in support of conclusions widely divergent from those of the orthodox political creeds. But all our organisations are political; and how is 'any voice not of thunder' to make itself heard? Yet surely there must be many whose single aim is to discover the truth; and surely the questions are important enough to repay study. Are there, perchance, ten who will pledge themselves, in respect of such social questions, to worship Truth only, and neither to bend the knee to the Baal of Liberalism nor to worship the Golden Calf of Conservatism? Peradventure they might gather others to themselves; and, though their single voices are feeble, it might come to pass that after many years the walls of the forts of Folly would fall at their shout.

THE CAHUSAC MYSTERY.

By K. and Hesketh Prichard, Authors of *Roving Hearts*, *Don Q*, *Tammer's Duel*, &c.

CHAPTER VI.—INNUENDOES.

AFTER a moment De Sarsan rose and followed Wilford, whom he found leaning moodily on an outjutting bracket by the fireplace. A little knot of people were gathered at some distance, Lady Fettering apparently trying to persuade Mrs Westaway and Alice Lanceley to remain longer, while on one side Lady Madesson was talking with her usual animation to Cahusac.

'See Lorrie!' Wilford said to De Sarsan, who joined him. 'Look at her now!'

'She is always equally charming,' remarked the other.

'You don't know her as I do! That is her way with a new man when she wants to annex him. Don't I know it, look and smile, word for word, and trick by trick! Her face showed it when he passed, and she told me to stop him.'

'What! Cahusac? She has surely met him before?'

'Yes,' Wilford laughed; 'but he has avoided her.'

'He saw danger ahead?'

'It's a kind of danger most men like to get into when it's so propitious, by Jove! Now she'll keep him hanging on for six months until she is tired of him, and in the meantime I'——

'So!' De Sarsan's moustache did not hide a derisive amusement, as with a fleshy forefinger he made an imaginary spiral in the air tending downwards. 'My poor friend, let us by all means take measures to evade so melancholy a conclusion.'

Both men advanced upon the group. Alice turned to meet them with a tremulous smile.

'We are going, Wilford.'

'All right, I've no objection,' returned the young man brusquely as he passed on to speak to Lady Madesson.

Alice's expression altered. 'Is he not coming also?' she asked of De Sarsan in a lowered voice.

De Sarsan shook his head. 'If he should not go with you, my dear young lady, will you trust him to me? I will do what I can. But he will be difficult to-night—ah yes, I can perceive it—very difficult,' he answered gently.

'Perhaps Mr Cahusac can persuade him,' she murmured.

De Sarsan followed her glance with an obvious superciliousness in his own. 'Am I to understand that M. Cahusac is also a friend of our dear Wilford?' he asked. There was a fine mingling of courtesy towards herself and contempt for Cahusac in his manner.

The girl's manifest astonishment at the tone he adopted annoyed him. 'They were at Eton together. Didn't you know?'

'Ah, that explains! Otherwise'——

'Otherwise?' repeated Alice.

'They would not be great friends perhaps. That is all, quite simply, mademoiselle.'

'It is time for you to trot home, little boy, and be tucked up in your own little cot. Go away; you are detestably cross,' Lady Madesson was saying meanwhile, as Wilford stood white and sullen beside her.

'I begin to feel that way myself,' put in Cahusac, laughing.—'Shall we make a start of it, Lanceley?'

'All right, go ahead.'—And as Cahusac left them Wilford added, 'I only want to be rid of that brute, Lorrie. I'm not going while there's any fun on here, I can tell you. I'll stay and look after you.'

'Thanks, but you see I've a notion of doing without you,' she answered quietly.

'Well, I shall stay all the same—and look after you too. Now!'

'It's rather a pity that private houses are not so well supplied with the comforts of life as saloons,' she retorted.

'There's some meaning in that speech, I suppose?'

'Yes; we need a chucker-out.'

'What do you mean?' he asked furiously.

'I mean that you're too drunk for decent society,' she replied.

'I've—I've been as drunk—as you choose to call it to-night—before, and, by Heaven, you seemed to like it, my lady!' The insult in the words was doubled in his glance and smile.

'I'll never forgive you as long as I live!' She faced him with a dusky glow in her cheeks, and her voice took a deep note.

'That also I have heard before,' he grinned, 'although I will admit the provocation was of a different nature.'

Cahusac returned at this moment. 'Come along; the carriage is waiting.'

'Then it needn't wait, nor you either. Go on, I say.'

'All right; but if I were you I'd take Lady Madesson's advice, as I am doing myself.' He bowed slightly toward her. 'Remember we must take an early train in the morning.'

'See here, Cahusac, there's one thing every man can do, and that's to mind his own business. Keep your advice till it's wanted.' The foolish rudeness sounded very clearly through the hall. People looked round and laughed, while Alice turned to De Sarsan in dismay.

De Sarsan's pantomime of metaphorically placing himself at her disposal caught Cahusac's attention. To his quickened apprehension the gallantry had a real meaning attached to it. De Sarsan slipped his hand through Wilford's arm.

Wilford flung out an angry word. 'Look here, De Sarsan, we've had enough of this fooling. I don't care for interference any more than my seniors.' With that he stalked toward the billiard-room door.

De Sarsan tucked in his elbows and spread his fingers, but with the subdued gesture one notices in those of his race who have spent much of their time in England.

'Alas! we poor diplomats must learn to bear defeat and grin as though we liked it. Is it not so, M. Cahusac?'

'I can't say we have been particularly happy in our methods to-night,' said Cahusac coldly. 'We diplomats!' he thought to himself. 'The scurrilous scoundrel!'

Lady Madesson at once resumed her conversation with Cahusac, and De Sarsan lingered for a moment beside Mrs Westaway, for Lady Fettering had fluttered off before this. But the Belgian's attention was fixed on Cahusac rather than on the lady to whom he addressed himself. De Sarsan was Celtic, and he shared in some degree the Celtic power of gauging the mental atmosphere of those about him. The young man opposite was listening to Lady Madesson with a half-smiling gravity, and punctuating her brilliant talk with a word here and there that lent to it an added point and piquancy. In a flash it came to De Sarsan what the modulated voice would say if its owner shared the knowledge of the part he, De Sarsan, had taken in the events of the April evening in Park Lane. The fancy burned for a moment so fiercely in the Belgian's brain that he was vaguely afraid of thought-transference. De Sarsan pictured to himself the grave raising of the brows, and the quiet, expresssionless, inexorable anger. He became aware that if Cahusac ever knew, there would be room in the world for only one of them. Until quite lately he had forgotten Malcolm Cahusac amidst the tumultuous play of intrigue, scheming, and counterplot which composed his own career. De Sarsan felt he had been deceived by the young man's silent resumption of his life, from which he had too hastily assumed a lack of character and energy. Now, when chance threw them face to face, he discovered that the younger Malcolm Cahusac was also a man to be counted with.

Mrs Westaway, Alice, and Cahusac being gone at last, De Sarsan offered his arm ceremoniously to Lady Madesson to conduct her to a seat.

She took it, with amusement in her blue eyes. 'You're very polite, monsieur. It gives one a change at Fetterings to be elbowed around like this.'

'I have few such pleasures, madam,' he replied with effusion. 'Our friends have after all been obliged to leave their pet-lamb among the wolves.'

'Lambs are so intolerably silly!' she said shortly. She was tiring of De Sarsan.

'His friend M. Cahusac is an interesting fellow. I have never before had the pleasure of meeting him.'

Lady Madesson murmured something.

'There is a history attached to him, is it not so? I remember hearing of a mysterious story—a step-mother who became insane—something of that sort,' De Sarsan went on as if making talk.

'Now was there? How very curious! Tell me about it.'

'I, my dear madam—I, a mere foreigner—to know the secrets of an English great house! I could not aspire to so much.'

Lady Madesson settled herself comfortably into her place and opened her big black fan. 'How delightful! I hope it is a good scandal. Go on!'

De Sarsan shook his head. 'My dear madam, I have told you that I know nothing positive.'

The broad curve of her fan came down in a soft swoop upon his arm for a second. 'My good monsieur, you may assure me as much as you like; but—you know all about it. Go on. It is my order.'

He disclaimed the knowledge, she coquettishly affirmed it, and presently—by a hundred innuendoes, half-spoken sentences, and undermeanings—he had conveyed to her the fact that a very ugly story lay somewhere in the background of Cahusac's life.

'I wonder for what reason he hates Malcolm Cahusac so badly,' reflected Lady Madesson to herself when De Sarsan had gone. 'And he allowed me to see it! What fools men are!'

CHAPTER VII.—WORDS.

A MAN is never himself save when he is alone, and the key in which he then thinks is the tone-note of his mental world. At other times he is less or more than himself—momentarily baser, momentarily nobler, a thing swayed by the mood of contact or of expediency. But alone with his own memory he cannot choose but fall into accord with the prevailing echo of his past.

Malcolm Cahusac, although he had made himself a man of action, was endowed with many of the qualities that go with a strong imagination. At this period he was overwhelmed by a wave of fatalism. For him the butterfly world around emphasised its own sadness. Events working upon the sensitive material of his inner nature had forced back hope and the spring of youth,

and left him sick of that ancient view of life which tells us that it is all old, stale, autumnal, overhandled; that the coming and going of the leaf upon the tree, of man upon earth, is only part of a deadly routine without meaning, without purpose save only the temporary furnishing of a planet. He fancied that he was looking upon the world stripped of its romance, and that he saw it as it was—a winter stubble-field, alone and acold, in some squalid town suburb. About it blew a raw wind, which blighted and held no promise of spring, and over the rag-polluted waste arose a desolate wailing of dead lips. Was it a mood or a vision of truth? He did not know it was merely the cost of possessing an imagination, which is a gift we pay for in agony.

The conversation between Detching and Cahusac, drifting listlessly to and fro, held somewhat of the meaning of what has been written. Detching waited. He saw that the long apparent calm of his companion's life had been disturbed, the fountains of the deep had been broken up, and the tide was rising with a terrific force; and he—he was standing by as usual.

Cahusac broke a long silence by a question: 'Do you happen to know that Mrs Westaway is living in Park Lane?'

'In that house?'

'Yes; she has taken it furnished for the season from the Blaines. I have never been there since.' He laughed slightly. 'You were with me when I left it, and by an odd coincidence you will be with me to-night when I enter its doors again. It is odd, you know, for the past is not dead, as I had lately begun to believe.'

'What has happened?'

'Nothing very tangible. But there are rumours, vague hints. I can't tell you where they come from nor how they have arisen. At present perhaps no one would notice or understand them except those who know.'

'How have they reached you?'

'I've seen them in the *Gas-Lamp* principally, which copies from *L'Œil* more or less. It is an unmistakable attack. It touches on my father's death with cynical comments.'

'Nothing about Lady Cahusac?' asked Detching.

'No,' said Cahusac sharply. 'Thank God not that!'

Detching stared in silence at his boots, which rested on the edge of the mantelshelf. 'There is a small point I have never mentioned to you. It probably has no connection with our affair. You may recollect that on that night I was walking down from the Marble Arch towards Piccadilly? It was very late, and there were not many people about. The single person whom I saw in the near neighbourhood of your house was a man like a foreigner, lighting a cigar under the lamp-post next above your house.'

'Like a foreigner!' repeated Cahusac. '*He* would have been a foreigner.'

'Not necessarily. Some of us have our price too.'

'Detching, that is the man!' Cahusac said with conviction. 'If you could lay your finger upon him you would break up the most dangerous wasps' nest in London. In diplomatic matters there is always a leakage. Those concerned find it a dangerous service, and are paid on corresponding lines. Now and then a side-wind comes to us, and we take action.'

'Diplomatic action?' inquired Detching with some dryness.

'When a man is making off with stolen secrets in his pocket, if you catch him you may find diplomacy come to hand with conclusive methods,' answered Cahusac grimly. 'A spy is an outlaw, and has no remedy. His own people curse him, and there is no scandal.'

'I see. If I can lay my finger on the man I saw that night, you would'——

Cahusac got up. 'Do you remember the winter we had in India? We used to tie up a goat for the tiger.'

'And wait for him, eh?'

Cahusac nodded and smiled. 'Yes. I think there is a tiger on my trail. Keep your eyes open.'

Detching fingered his red moustache. 'It would be good *shikar*,' he said.

Cahusac's thoughts swung away on the word to the night-noises of the jungle, and came back with a zest to that indefinable *shikar* in London. 'Come along,' he said aloud. 'It's time we were at Mrs Westaway's.'

(To be continued.)

THE ROMANCE OF A FLAG.

THE KING'S COLOUR OF THE SIXTY-NINTH REGIMENT.

By Colonel R. H. Mackenzie, F.S.A Scot.

WHEN Marshal Ney, 'the bravest of the brave,' decided on his supreme effort at Quatre Bras, he sent for Kellermann, commanding the Third French Cavalry Corps. 'My dear General,' said he, 'the safety of France is at stake. Take your cavalry, and fling yourself upon the British centre. Crush them! Ride them down!' War-worn Kellermann was not

the men to blench at such an order; nevertheless he pointed out that the enemy were now twenty-five thousand strong, and that he had with him only a single brigade of cuirassiers, the other three brigades being far to the rear, in accordance with Ney's own commands. 'What does that matter?' roared Ney above the thunder of the guns. 'Charge with what you have; ride them down! I'll support you with all the cavalry I have. Go, go, I tell you!' Ten minutes later Kellermann's cuirassiers were under way. In column of squadrons, eight hundred steel-clad horsemen were about to make their effort, when Major-General Sir John Halkett, commanding the 5th Infantry Brigade of the 3rd British Division, who had galloped to the front to reconnoitre, turned round his horse and hastened to dispose his brigade in such a manner as to render it fully prepared to brave the coming storm. On his way he sent an intimation to Major-General Sir Denis Pack of his discovery, and orders to the Second Battalion of the Sixty-ninth Regiment, one of his own brigade, to prepare forthwith to receive cavalry.

The Second Battalion, Sixty-ninth Regiment, was formed in Lincolnshire in 1803, on the recommencement of war with France; it had served in Holland in 1813–14, and had already suffered the misfortune of losing its regimental colour at Bergen-op-Zoom the year before, but without any reflection on the honour of the regiment—the colour is now in the Hospital of the Invalids in Paris—so that in the Waterloo campaign the Sixty-ninth carried the king's colour only. A sudden and heavy cannonade had already opened from the French heights, a sure prelude to the attack which was about to take place, and the battalion was in the act of forming square in accordance with the orders of its commanding-officer, Lieutenant-Colonel Morice, when the Prince of Orange rode up and asked what they were about. 'Preparing for cavalry, sir,' was the reply, 'by the Brigadier-General's orders.' 'Oh, cavalry be d—d!' remarked His Royal Highness; 'there's none of them within miles of you. Reform column, sir, and deploy at once.' This fresh order was in the act of being carried out when Kellermann's squadrons came thundering down, taking advantage of the surrounding high corn, and unperceived till quite close to the spot; and rushing suddenly and impetuously upon a flank, they succeeded in completely doubling up the regiment, riding right through it, and along and over the unfortunate men, of whom great numbers were cut down. Some officers and men took shelter in the square formed by the Black Watch and Forty-fourth Regiments; the mounted officers gained the other side of the road, pursued by some of the enemy, and escaped by riding through one of the Hanoverian battalions lining the Namur road.

But what had become of the king's colour of the regiment, which officers and sergeants were defending with their lives? Ever since the days when the golden eagles glittered in front of the Roman Legions, the object of their fondest devotion and attachment, soldiers have regarded their colours as sacred, bound to them by the united influence of religion and honour. The flag is a symbol, intrinsically valueless, extrinsically priceless. The perishable material of which it is composed may be purchased at any time for a trifle, but the ideas it represents are the soldier's costliest inheritance. The king's colour, in particular, is the pledge of his loyalty to his sovereign and his obedience to the laws of his country. The Sixty-ninth were not the men to part with theirs without a struggle. It was carried on this occasion by Christopher Clarke, a boy-officer, who was hacked and cut in a fearful manner, as were also Major Henry Lindsay and Lieutenant Brooke Pigot, who stood by him. The French cuirassiers were determined to carry off the trophy, and when they had overwhelmed by sheer numbers the small band of British heroes, the colour was wrenched from the hands of its bearer by a trooper of the 8th French Cuirassiers named Lami, who succeeded in carrying it off and offering it on the field of battle to Ney, who hailed it as the harbinger of victory. By him it was presented to General François Zavier Donzelot, who commanded a division under the Marshal. The Second Battalion of the Sixty-ninth was present at Waterloo, but without colours, and there its gallant commanding officer, Morice, was killed. The battalion returned home at the peace, and was disbanded in 1816. The honour of 'Waterloo' was taken over by the First Battalion, the present Second Battalion of the Welsh Regiment, and the incident of the colour was gradually forgotten.

Nearly a century has elapsed and the scene changes. We are friends with our gallant opponents the French, and a British officer is travelling peacefully in the Touraine district of France. At Azay le Rideau he visits the château which has lately been converted by the Government into a museum. In the hall-porter's lodge his attention is attracted by two flags labelled 'For Sale,' one of which has the appearance of being a British Union-jack. The price asked for the flags is six hundred francs, which being at once paid, a British colour which had been captured in battle returns peacefully into British keeping, and is brought to England. It is undoubtedly the identical king's colour which, after a gallant defence, was captured from the Second Battalion of the Sixty-ninth Regiment at Quatre Bras on the 16th June 1815. From General Donzelot the trophy passed to his nephew, General de Ricard, and from him to his son, Louis Zavier de Ricard, until recently the curator of the museum at Azay le Rideau, who left it with the present hall-porter in liquidation of a debt:

But a moth-eaten rag, on a worm-eaten pole,
It does not seem likely to stir a man's soul.
'Tis the deeds that were done 'neath the moth-eaten rag,
When the pole was a staff, and the rag was a flag.

The British officer to whom the country is indebted for the recovery of the trophy is Captain J. P. Jeffcock, late Inniskilling Dragoons. An illustration of the flag was given in a recent *Journal of the Royal United Service Institution*.

THRIFT.

A STORY.

By W. L. George, Author of *A Bed of Roses*.

WILLIAM CASSON listened thoughtfully to the distant chimes—St Mary-at-Hill perhaps, or St Michael in Cornhill; he had never troubled to inquire. There was a pause, and the hour of one struck. He laid down his pen, closed the sundries ledger, and, standing up, removed his office-coat—a thing of tatters which aroused envy among the juniors, for an office-coat should be tattered. He left the room, and reappeared some minutes later, drying his face and hands after his midday wash. As he rubbed he puffed, for William Casson was not a young man. He had one of those long, thin faces that always look hungry, a pointed nose, a hard mouth, and scanty gray hair. He was sixty, but looked more, perhaps because his attire had no glory; to evoke William Casson in one's mind was at once to think of dark-gray trousers with baggy knees, a wrinkled waistcoat crossed by a clumsy silver watch-chain, a dark-blue poplin tie much discoloured and tightly drawn. He had never been seen wearing obtrusively new boots or glossy, unfrayed linen, or—even in the giddy days somewhere round 1870—with a flower in his buttonhole. The mysteries of William Casson's costume had ceased to interest his fellow-clerks; they had given up asking him ironically whether his trousers were the work of a bird-fancier. He was merely a seedy old man who had for forty years kept a ledger for Labonde & Company; they had engaged him for the purpose at twenty shillings a week, and raised his wages by small increments to thirty. And there he now stood, blowing as he rubbed his long, pale face.

'Is it cold to-day?' he asked of Vanner, the junior at the next desk.

Vanner grunted without raising his head. He was copying out a statement of account in the beautiful writing by favour of which he lived; his head slowly followed the movement of his hand, and as he wrote his tongue protruded a little, while his eyes were anxious. For Vanner was an artist in his own way.

Old Casson, taking no notice of the snub, looked out of the window at the doubtfully clear sky over Fenchurch Street. It did not look very warm; still, it had not been cold when he came up in the morning. He decided to leave his overcoat on its peg, and putting on his ancient bowler, left the room without another word. As he passed down the stone stairs of the warehouse he still turned over in his mind the question of the overcoat. The air outside struck him as chilly, but it was bearable; and he reflected with satisfaction that, after all, it was not really cold. Meanwhile his treasured overcoat could hang safely on its peg and be saved unnecessary wear.

William Casson made his way quickly towards Lombard Street, a copy of the *Times* under his arm. He never bought a newspaper, but had a traditional right to borrow the office copy every day from the general office. So well established was the practice that Mr Labonde himself had learned to give up asking for the *Times* between one and two.

The old man walked rigid and resolute, his bowler hat set far back on his gray hair; he looked neither to the right nor to the left, but made, as if by a homing instinct, for the tea-shop where he lunched. His tea-shop was not one of those new limited liability creations which flaunt tiles and urns and cakes and appetising window exhibitions; it was very much what it had been in the seventies—a temperance tavern with a floor of boards, hard benches, and stained deal tables. An untidy girl laid before him, without orders, a cup of tea, three slices of brown bread, and a piece of cheddar, which Casson consumed slowly while he read the leading article of the *Times*, the paper securely shored up against the dirty cruet. He took not the slightest interest in the eating-house—its savoury steaming pans full of sausages, the piles of rough greens, the noise, the clatter of knives and forks; he seemed very uncomfortable, for two office-boys and a carman had crowded on his bench; but he was not uncomfortable, not only because he had lunched on this very spot about twelve thousand times, but because he had realised twelve thousand times that here a cup of tea cost a penny-halfpenny instead of the twopence charged by the new establishments, while a penny bought three slices of bread instead of two.

William Casson slowly ate his food without any show of pleasure. He ate because eat he must, and grudging rather than joyful; often he was haunted by horrid calculations such as:

'If I had no lunch I could save threepence-halfpenny a day; three hundred and sixty-five times threepence-halfpenny is'—— And then he would work out the annual waste on lunch, the amount he had wasted on lunch for forty years, the accumulated compound interest on the saving he might have effected if he were not addicted to lunch! The results were awful, heartrending. Still, he found that he had to have lunch; it was a great trouble to him.

Twenty minutes were allotted to the meal, ten to a walk to St Botolph's and back, twenty-five to a further perusal of the *Times* in the churchyard. Then William Casson returned to the office to post in the sundries ledger the vagaries of casks, bottles, and corks, the results of mysterious adventures where demurrage, breakage-allowances, and special discounts played their part. He took no interest in these affairs of Labonde & Company, Wine Merchants and Bottlers; the vast sums which he mechanically entered held no meaning for him. His imagination had once been stirred by the invoicing-clerk, who had tried to assuage a moment of revolt against the bottles by telling him that David Copperfield himself had worked among bottles. William Casson acquired a deep interest in David Copperfield, but he never read the book. He was often seen gazing at a cheap reprint which contained the romance of bottles; but he could not make up his mind to buy it, for sixpence was sixpence. And David Copperfield became idealised as the classic of bottles, as a book dealing with nothing but bottles, as the wonderful epic of bottles, which he could never afford to buy.

At six o'clock William Casson placed the sundries ledger in the safe and left the office. A short walk brought him to his room in Finsbury, where the landlady offered him food and other perfunctory attention when she was not doing the washing in the basement in the midst of a hot Scotch mist. At seven he ate. Then he walked to the 'Angel' regularly; and, untempted by the glow of this Mecca of the omnibuses, he would turn back, climb to his room at the top of the house, up the dark staircase with the broken steps. There he slept, near the thunder of the trams in the City Road, haunted by the smell of the landlady's soapsuds and the cooking of her greens. But the uncarpeted room, in which there was no grate, cost him but four shillings a week.

It should not be concluded from the manner of William Casson's living that he was a poor man. One can be rich or poor on thirty shillings a week or on ten thousand a year; it is all a matter of wants, and Casson had reduced his to vanishing-point. He most morally lived well within his means, for the example of his childhood's home had taught him that the wages of extravagance is penury. It was because he had seen his old father and mother remove to the workhouse, his sister vanish into service, his elder brother emigrate and also vanish, that he had sworn not to depend in his old age on a curmudgeon State. He was going to save money, he thought in 1870, and forty years later he was saving it still. Father, mother, sister, all were dead; his brother was lost. Thus, standing alone, he decided to end free. It was all a matter of saving five hundred pounds, which would buy a forty-pound annuity and a peaceful end in a cottage.

It had not been, some would say, a cheerful life. For forty years rent and breakfast had cost him six and fourpence a week, his midday meal two shillings and a halfpenny; his landlady fed him at night for three and sixpence a week. He thus found himself living and clothing himself for some fourteen shillings a week. He had never had a fire, bought a newspaper, visited a music-hall; he had hankered after pleasure, but yet had never wasted a halfpenny on tobacco or on drink. Indeed, he had never spent money when it could be helped; there had been casualties, an illness during which the landlady had forced upon him a useless doctor and an extortionate chemist without realising, the insensitive woman, that William Casson preferred to die now to dying poor; there had also been a terrible day when Mr Labonde had commanded him to go out at once and buy a new rig-out, on the absurd plea that he was a bachelor and could afford it, also that his status in the firm required of him good clothes. William Casson had grudgingly bought the new rig-out at a second-hand dealer's in Hatton Garden, who was his tailor, his hosier, and his bootmaker too (which explained why his clothes were never new); but it had given his exchequer a shock from which it did not recover for ten long weeks.

Yet, in spite of these set-backs, disease of the flesh, and trammels of fashion, William Casson had marched splendidly towards his goal. He had set aside everything for economy. He had, in the early seventies, removed from the fields of Highbury to the slums of Finsbury to save the daily 'bus fare; he had steadfastly refused to join in sweepstakes; he had given up religion because of the clamorous plate thrust before him by the sidesman; he had never played games, because clubs could not, apparently, be carried on without funds; he had never taken holidays, or rather had made them profitable by devoting these wasteful periods of his life to temporary work in other offices. Naturally, he lived alone, having mastered the principle that no company can be had for nothing; besides, none obtruded themselves upon him, not even his facile fellows at the office, for William Casson had shown himself a 'hunks' somewhere about 1892, when Mr Labonde, senior, died. The office, having prayed for many years that Mr Labonde senior's troubles might be lifted from him, decided to commemorate the occasion by a wreath; one

man refused his shilling, and that was William Casson, the 'hunks.' It was felt that he ought to have contributed, either in a broken-hearted frame of mind or in a spirit of thankfulness (this being optional); but he kept his shilling, and was rewarded by an atmosphere of unfriendliness which emanated traditionally from new clerks as well as from old. He lived in the desert.

William Casson had had his struggles. He had known awful moments when the devil tempted him and strove to make him order an egg from the untidy girl at the tea-shop, or to make him buy an evening paper when people were being killed in South Africa in interesting ways; the devil had led him past book-shop after book-shop where the dastardly bookseller featured David Copperfield, the hero of the bottle-trade; the devil had whispered 'Kew Gardens,' 'the old Mogul, only fourpence,' 'Earl's Court;' but he whispered in vain. William Casson had saved his money, fighting down the desire for riot, gambling, glorious drunkenness, glorious life. Once only the devil nearly triumphed; he made William Casson fall in love. That was a terrible affair, for she was slim, fair, roguishly blue-eyed, and wore shoes so small and neat that William Casson dreamed wonderful dreams, where he knelt and humbly kissed them while she smiled over his bent head. She packed bottles while he entered them, and packed them with a winning gaiety, singing, as she packed, snatches of 'He's not a marrying man, my love,' and 'Champagne Charlie.' One day William Casson went into the warehouse where his goddess was busy packing. He watched her raptly, her rosy fingers nimble in the straw, the toss of her conscious fair head (he did not know it was conscious), and then the load on his shoulders became too heavy to bear. Recognising, full of joy and fear, that his hour had struck, he mumbled a request that they might meet that evening under the porch. The invitation was accepted with disturbing alacrity, and William Casson went back to his ledger, his head buzzing with the music of her laugh, his eyes dazzled by her yellow hair, and he could not look at his own lean hand on the pen without thinking of the rosy fingers that so magically packed.

It was a night of terror. The divinity, having bewildered him with one blue-eyed flash, stopped in front of a barrow in Gracechurch Street.

'I am hungry,' she declared, and, in the presence of her lover, calmly seized an apple and bit it. She bit it while William Casson stood with open, horrified mouth.

'Fourpence, guv'nor,' remarked the coster as he put four more apples into a bag; 'we sells 'em by the pound.'

'Right!' said the charmer; 'put them in your pocket, William. We'll eat them on the 'bus.'

And William Casson, impotent in presence of this munching girl and this threatening coster, allowed them to thrust the apples into his pocket while he paid the price of a lunch. Gloomily then he walked by the side of the girl, uncheered even by the immaculate little feet. At the Bank she lightly skipped on to an omnibus. He was still on the pavement when she waved to him from the top, fairy-like and mischievous.

'Come along, William!'

He came along as if in a nightmare. He paid, and as his pocket lightened realised what it must feel like to have a finger amputated. He paid for a ribbon picked off a stall; he paid for a badly printed song some strollers were singing in the lane outside the 'Cheshire Cheese;' he paid—he paid—and she laughed, the merry siren, as she drew his life's blood—he paid—paid. His head was like putty, but his protesting tongue clove to his palate; he was bewitched; he could not believe he walked; he must wake up soon and find that all was well with his life. At last the siren went too far; she stopped with deliberation opposite Eleanor's Cross, and suggested that they should go to Cremorne Gardens. William Casson looked at her as if she were an evil spirit. Cremorne, the dazzling home of fashion—gilded haunts of vice—roundabouts outside, penny a ride!

'No,' he said bluntly, and suddenly felt a man again.

'Why not?' asked the girl angrily.

'Because'——

'Oh, because? Because you're a hunks! Hunks!' She turned on her little heel, vanished in the crowd, and with her went the spirit of life.

Thus briefly was William Casson's dream broken and laid low with shattered wings. In a sense a load was lifted from him, for he had never believed, even when Cupid shot, that two could live as cheaply as one. Thenceforth he avoided the dangerous blue eyes, the nimble, rosy fingers, until, after a while, she married some one else and freed him from his thrall.

His agreeably joyless life flowed in its old channel; he amassed five shillings a week, then six, then seven; then, as the delirious years passed by, as much as sixteen. The Savings Bank could no longer help this man of property, for he had passed the legal maximum; interest accumulated, shillings at a time, then pounds at a time; William Casson's wealth overflowed into the penny bank, for there seemed to be a conspiracy to make him a rich man. At sixty he had five hundred pounds. He carried about with him the immense power of those five hundred pounds, not money invested in Consols, wretched things that fluctuated and made you in one day the poorer or the richer by the earnings of a month, but real, golden money. And now the time had come for him to retire, as a man of means, into the house of some cottager of Norfolk, where blows fragrant the North Sea

wind. Five hundred pounds—his ambition—meant liberty. And now he had five hundred pounds.

William Casson sat on a bench outside the cottage. He had earned his right by the labour of forty years. All his affairs were arranged, his forty-pound annuity bought. He need do nothing now but sit on this bench and watch the rolling sea. As he watched, this first day, memories came over him, memories of London, the bells of St Mary-at-Hill, the barrows and their costly bananas, the cold room in Finsbury. He thought with some bitterness of all this sight of the sea had cost him. He had been alone, and had known no joy; he had starved and toiled; he had turned from his fellow-man, followed no statesman, served no God; he had flouted love, too—love, the bearer of gifts. An immense sorrow was upon him as he thought of the fair girl with the small, neatly shod feet.

Now a stranger was by his side—a lawyer, that he could see by his frock-coat. He was talking a great deal. 'What did he want?' thought old William Casson.

'We had a lot of trouble to find you,' said the man; 'quite a chance we found you at all. As I was saying, your brother died a wealthy man, a very wealthy man. We believe, Mr Casson, that the estate will be worth twenty thousand a year.'

'Yes, yes,' said the old man dully. 'Twenty thousand a year. Very nice.'

'It will be very pleasant for you, Mr Casson, especially if you have not saved much,' said the lawyer, with a shade of patronage in his voice.

'Ah,' said William Casson, 'I did save—save.' And he thought of all the bare past—the desert through which he had trudged to attain this rolling sea, the fair-haired girl married to another.

'You need not have done so,' said the lawyer, and his laugh was professional and jolly. 'Pity you didn't know!'

Old William Casson did not answer. He had bought the sea and lost it, earned liberty and found it too dear. He had not lived, and now he was to die.

'Yes,' he muttered, 'it is a pity. If I had known'——

But the flood was too strong for his old heart. Sixty years of joys forfeited came beating into his old body like an equinoctial tide, sixty years of life despised, sixty years of prudence without a single glorious break!

'If I had known!' muttered William Casson. At a bound his spirit cast its bonds and flew away to the immaterial unearned joys.

THE WHITE ANT IN NORTHERN AUSTRALIA.

By F. A. W. Gisborne.

A VISITOR to the vast region known as the Northern Territory of Australia views with astonishment the number and size of the ant-hills scattered profusely over the country. The termite—commonly, though improperly, called the white ant—and the mosquito are the two great scourges of the region. The latter is the universal tormentor of human beings and animals of all kinds, and the distributor of tropical diseases. The former not only devastates gardens and plantations, but extends its ravages to man's dwellings, and literally eats the settler out of house and home, massive piles and beams being reduced to mere shells; and the pertinacious assailants have been known to drill holes through sheets of lead, and even to cut grooves along the surface of billiard-balls. Only two or three kinds of timber found in Australia are immune from their attacks; one, the cypress-pine, fortunately being fairly plentiful in the northern forests. This tree supplies the material commonly used for the framework of buildings; and in Palmerston, the capital and only town in the Territory, almost all the hotels, stores, and private dwellings are simply built of sheets of galvanised iron nailed on to frames of cypress-pine. The termite finds iron a little too tough for its teeth, and the flavour of the pine appears to be too strong for its palate. But the simple method of architecture practised has its inconveniences in a town where the average maximum temperature during the day throughout the year is ninety to ninety-two degrees in the shade (last year, according to the official observations, it was exactly ninety-one degrees), and where the mercury seldom falls below seventy degrees on the coolest night. The half-baked condition of the ordinary resident of Palmerston is largely attributable to the minute but persistent enemy against whose attacks people are obliged to fortify themselves in a manner by no means conducive either to health or comfort.

On up-country cattle-stations the destruction of fences and stockyards due to the attacks of the same pest is enormous, and renewals have to be made incessantly. One squatter, whose modest domain measured a hundred miles across in a straight line, told the writer that the stockyard at each of his out-stations had to be entirely rebuilt every second year. On his run cypress-pine was unobtainable, so ordinary timber had to be used, to the great increase of the cost of management. Along the telegraph-line, stretching from Palmerston to Adelaide, the poles used to support the wires are of iron. Otherwise a whole army of repairers would be kept continually at work.

Considering the comparatively minute proportions of the architects, the size attained by some of the ant-hills is almost stupefying. From fifteen to eighteen feet may be said to be near the average height; but occasionally monsters are found towering to the altitude of twenty-five and even thirty feet. The shape varies considerably. The generality of the hills are formed like irregular cones, with projecting buttresses and pinnacles. Sometimes a specimen is found almost, if not quite, symmetrical in outline, much resembling the steeple of a partially buried church; others are rounded and dome-like. But the most curious structures of all are what are called meridional ant-hills. These suggest gigantic, tawny hands planted upright, with the wrists in the ground; the palms, some ten or twelve feet across and about two feet thick, shooting upwards, with numerous small, blunted pinnacles resembling stumpy fingers. The most striking peculiarity of the meridional ant-hill is that its opposite edges invariably point with exact precision to the two magnetic poles. Mathematical accuracy in this respect is exhibited by every hill examined, and evidently some reason must dictate this extraordinary arrangement. One would naturally suppose that edifices of the kind would, for the sake of stability, be so built that their edges, not their flat sides, would be exposed to the prevailing winds; but this is not the case in regard to the remarkable structures referred to. The monsoons, which blow for alternate periods of six months in the year throughout the Territory and Northern Australia in general, are the north-west or wet monsoon, and the south-east or dry monsoon. The meridional ant-hill, therefore, is not designed to minimise wind-pressure. Some other explanation must be found, and this still remains a puzzle to the scientific investigator.

The number of the abodes of the industrious little creatures alluded to is incalculable. Extensive plains may be frequently found thickly dotted with hills, though a close inspection will often show that most of them have been abandoned. Such plains look like vast cemeteries studded with thousands of yellow monuments and monoliths. They are, indeed, the graveyards of ancient forests whose trees, in the course of a long period of time, have been entirely devoured by their pygmy but relentless foes. Marvellous as the hills are in number and size, the subterranean operations of their builders are even more wonderful. The termite city is frequently found erected on an arid plain many miles from the nearest surface-water, or on the crest of an isolated eminence or plateau. Its inhabitants must have water both for drinking and for carrying on their building operations. Knock a fragment off an ant-hill overnight, and the next morning you will find the breach carefully plastered over with moist clay, which soon hardens into a cement-like crust beneath the sun's rays. Where has the water required come from? Obviously from underground sources. The termite is far too sluggish in its movements to make long nocturnal journeys, and the workers —soft-bodied and defenceless—would soon be exterminated by their natural enemies were they to quit their impregnable citadel for the open ground. The required liquid, therefore, has to be obtained by industriously tunnelling downward until water is reached. The writer was informed by a medical man, who had made a long and careful examination of the habits of the termites, that these creatures had been found at a depth of seventy feet below the surface of the ground, and in some cases probably they have to penetrate considerably deeper. Like its cousin the bee, the termite is a paragon of ingenuity and industry; though the latter virtue, from man's point of view, is lamentably misapplied.

Each ant-hill probably marks the spot where a tree once grew. Riding through the bush in the Northern Territory, one frequently comes across a tree with an ant-hill in process of erection at its base, and closely clasping its trunk. Such a tree is doomed. While its stem serves to prop up the growing fortress of its destroyers, the ants gnaw away its vitals, transforming the wood pulp into food, and, when kneaded together with clay, into the material for making the internal partitions between the multitudinous cells, galleries, store-rooms, and chambers with which the whole edifice is honeycombed. When the original home has become overcrowded, hardy colonists must seek out fresh trees and build new mansions for themselves. In course of time a small clearing is made, and finally, as fire hastens the work of denudation, the forest is transformed into an open plain. More thorough instruments of deforestation than white ants could scarcely be found. In sailing along the north-east coast of Australia recently, the writer observed an island near Cape York whose condition strikingly exemplified the destructive operations of these voracious creatures. The northern half of the island was clothed in dense tropical jungle without an open space of any kind. The southern half consisted of bleak, wind-swept downs, over which were profusely scattered the red and yellow towers of the enemies of the forest. In this portion of the island there remained but a scanty fringe of vegetation along the sea-shore; elsewhere not a tree had survived. In another century probably, by the joint agencies of termites and bush fires, the whole of the island will be bald and naked, deprived of the beauty of its forest robes and tresses. The white ant is no respecter of nature. It typifies too well the sordid, ruthless spirit of modern commercialism.

Of natural enemies the white ant in North Australia appears to have too few. The great ant-bear of South America, the aardvark of

South Africa, and the pangolins of Africa and Southern Asia are not known in the island-continent, where the echidna (that strange egg-laying mammal), the squirrel-like myrmecobius, the Australian blind snake (*Typhlops rupelii*), and a lizard known as the Amphisbæna are the only foes not belonging to the insect world the termite has to fear. It might be suggested that the importation into the Northern Territory of a number of African and Asiatic ant-eaters would be of great benefit to the country in checking the ravages of its most destructive pests. Highly specialised animals of the type referred to, when transferred to new surroundings, could hardly adopt new methods of life that would render them a source of trouble or loss to human beings. At present, in Australia, a big red ant of highly martial disposition appears to be the termites' most formidable enemy; but the ant-hill is a fortress impregnable against the unaided attack of so small an assailant. It is interesting, however, to watch the results if you take a club and knock vigorously at the door so as to admit visitors. When a mass is broken off one of the projecting buttresses, fragments of hardened clay honeycombed with numberless cells, together with quantities of finely chopped grass used as packing material for the eggs, tumble to the ground, eggs and larvæ are scattered abroad, and astonished-looking nurses rush wildly about amid the wreck. Presently a few inspectors of public works appear at the breach to survey the damage, and these at once summon the guards, who in turn are speedily followed by bands of workers. The latter are small, white, and soft-bodied, and apparently have no means of defending themselves; whereas the soldiers, much larger in size, are distinguished by the possession of massive brown heads armed with a pair of serviceable-looking nippers. Long before order has been restored and repairs effected, however, a red ant scout appears on the scene, and on perceiving the opportunities offered, rushes away in an ecstasy of delight to summon his comrades to the feast. Soon an army of red ants is on the spot, and the termite soldiers deploy for action. Their military tactics are peculiar, and suggest a preference for defensive rather than offensive warfare. Each warrior, like the 'sniper' of a modern army, buries himself nearly up to his head in a pit, and opens his mandibles menacingly. His red antagonist, however, practises strategy of a carefully calculated and particularly effective description. Signalling a friend, he commences to fence with the immovable champion, the mandibles of the combatants crossing and recrossing like swords. While these exercises are engaging the attention of the imprisoned warrior, the red ant's comrade steals behind, dexterously nips the unfortunate termite in half, and carries away the head and thorax as his share, leaving the juicy abdomen, no doubt the choicest joint, for his more enterprising partner. Thus, by methods suggestive of Nelson's tactics at the battle of the Nile, the aggressors soon annihilate the regular forces of the garrison, and the eggs and helpless workers, left unprotected, are unceremoniously picked up and carried away by hundreds. Protracted and luxurious banquetings in the red ants' mansions must follow such forays; but by virtue of their architectural skill and their extraordinary fecundity, the termites nevertheless fully hold their own.

Future cultivators and planters in the Territory will have to exercise all their ingenuity to preserve their crops and trees from foes whose subterranean methods of attack render the task of repelling them extremely difficult. By continually stirring the soil above the roots of trees with the hoe, it is said, the pests may in some degree be kept in check. And the writer was informed that by boring a hole in the trunk of a growing tree and injecting a little arsenic and water, all danger of its destruction by white ants can be removed; but the remedy would seem to be somewhat drastic for the tree. It would be far better if some means could be devised for the extirpation of the pests themselves. Perhaps the scientist might oblige with a microbe; and if he could find another microscopic philanthropist of the kind with a predilection for the mosquito, future generations of healthy and prosperous dwellers in the spacious plains of tropical Australia would have cause to bless his name.

THE WEE FOLK.

A WIND from the Hills beyond the World
  Came crying between the sheaves;
It followed me over the meadowside
  To the Forest of Fallen Leaves;
It piped such a tune that I needs must dance
  In rustling fallen leaves.
    I dared not look to right nor left
      For fear what I might see;
    I heard faint footsteps on the ground,
      And knew 'they' danced with me.

The Wind from the Hills beyond the World
  Was sweeter than I can tell,
It carried the scent of the souls of flowers
  From the land where the Wee Folk dwell—
The souls of the blossoms, which died on earth,
  That bloom where Wee Folk dwell.
    I put my hands across my ears
      For fear what I might hear;
    But something plucked me by the gown,
      I knew 'they' must be near.

The Wind from the Hills beyond the World
  Grew weary, and went to rest;
The scent of the blossoms came down no more
  From the mountains dim in the west,
And the feet of the Wee Folk danced away
  To the opal lands of the west.
    I dared to look upon the ground
      Where piled the red leaves were;
    But though I saw the leaves alone,
      I knew 'they' had been there.

CITIES IN THE AIR.

By Colonel STANLEY PATERSON.

IT was hot—hot even for June in Southern Malaya, where one scarcely expects much coolness—hot with that heavy, tense, smothering heat that one only experiences in tropical forests on an airless day usually preceding a storm. It had been warm enough when we left camp an hour before daybreak, Suntul and I, to pick up the track we had lost the previous night, the track of the big bull *seladang*, that only three days before had charged and killed Baseha, the Dyak tracker, who had rashly followed the wounded beast in the gathering darkness. But now, with the sun almost directly overhead, it was stifling. Even the ever-cheerful Suntul was gloomy and despondent to-day, besides seeming disturbed and nervous because none of the other men were with us; for since Baseha's death I had put my foot down firmly, and forbidden the attendance of any more than one tracker when dangerous game had to be dealt with, as it was evident that the nerves of the Malays would stand but little further strain. None of them had been willing to follow me into this distant, unexplored jungle, and it was only Suntul's authority, belief in the white man's prowess, and the promise of (to them) exceedingly high pay that had in the end gained their allegiance. No mortal man, they declared, could pass through that jungle, because in the middle of it was a great bitter lake with many islets, on which were built large white stone houses inhabited many thousand moons ago by their forefathers, but now entirely in the hands of the *hantus* (ghosts), who by evil spells would either kill us or prevent our further progress, even if the wild beasts of the forest permitted us to get so far.

Well, we were now deep in the heart of this spirit-haunted jungle, and, strangely enough, from the time we entered it things had gone amiss with us. First of all, Nakodha had badly twisted his arm by a fall, and all the infallible *mantras* (spells) of old Raja Liang, the *awang* (wise man) of the party, had failed to cure it till a timely application of St Jacob's oil outwardly, fortified by a drop of whisky applied inwardly, had the desired effect. Then fever broke out, and sometimes for days we could not move camp because so many of the men were unfit to walk; some most necessary stores were irretrievably lost in crossing a river, food was scarce, game balked us every day, and now in the death of Baseha our misfortunes seemed to culminate.

Therefore Suntul and I were not in the best of spirits, as from sunrise we followed the big tracks in all their windings through that dense, dark forest, where the sky was seldom visible, and which even on the brightest day was pervaded by the gloom as of a moonless twilight. First through the low, wet jungle, knee-deep in mud and slime, we plunged along, slipping and stumbling over hidden snags and roots; then into slightly higher jungle still reeking with the morning mist and moving with leeches, over a hummocky bit pitted by innumerable old gold-workings, along a roadway cut and laid straight through this lonesome forest at some prehistoric date, presumably by the afore-mentioned ancestors, away over a small hillock with its dense undergrowth of spiky palms, necessitating the constant use of the *parang* to clear our way down to a little creek of very brackish water. On through the dry *damar* jungle the bull led us till 'at the time when the plough is idle,' as the Malay poetically terms the hottest hour of the forenoon, we emerged on a huge open patch of spear-grass or *lalang*, and, completely exhausted, leant against the bole of one of the outer trees, tearing open our shirts in the vain hope of getting a breath of air to fill our gasping lungs. Not a leaf stirred; not a sound was to be heard. Earlier in the day there had been noise in plenty—cries of animals and birds, the whirring and humming of insects, the shrill calling of tree-frogs and cicadas, the hundred and one noises of the jungle mingled in one vast and incessant murmur; but now, as is usual in the midday heat, all things animate slept, and there was a deep and impressive silence over all the forest. Awe-inspiring indeed is the desolate silence of the eternal snows and the great deserts of the trans-Himalayan plateaus, but for absolute soundlessness they are not comparable to a tropical virgin forest at noon on an airless day.

At last there came a tremor in the air—it could scarce be called a sound—a kind of thrill to which the nerves responded without one realising which set of nerves was affected. Very gradually it increased, pulsating softly in the still atmosphere overhead until it could be classified as sound, which, swelling in volume and ap-

 [*All Rights Reserved.*]

parently approaching us, soon resolved itself into the hum of many human voices. My attention was distracted by Suntul. He had fallen on his knees, and his face was greenish white as he plucked at my coat, whispering, 'Come away quickly, Tuan—come quickly; the *hantus* are talking in the *lalang*. Allah is good, but something dreadful will certainly happen to one of us from the hearing of this;' and he threw himself face downward on the ground, with hands clasped above his head in the attitude of prayer, repeating the 'Allah Akhbar' without cessation. As for me, I stood up, shook myself, and slowly lit a cigarette to make quite sure that I was awake and in full possession of my senses. For, as I stood in the *lalang* patch, fully a hundred miles from the nearest village, there passed over my head, in long waves of sound, all the turmoil of a great city—the shouting of the people, the rolling and creaking of the traffic, the clang and din of the workers, the clatter of the feet of the horses, the changeful but never-ceasing stream of sound that tells of busy life in the human hive. All this swept steadily over the *lalang* patch, first increasing in strength, then slowly decreasing till it became but an echo; then again we were in the hushed stillness of the noonday jungle.

Calling Suntul, who was still shaking and green with fear, I started off homeward, he alternately praying and bewailing his luck as we went, while I walked silently, trying hard to think out a reason for the phenomena I had just heard. Before we had been walking half-an-hour the problem seemed solved by a wild storm of thunder, lightning, and rain that broke over us; and for the rest of the march I tried hard but unavailingly to convince Suntul of the electrical origin of what we had heard, getting little response beyond, 'Perhaps, Tuan; but the *hantus* were talking in the *lalang*.'

It is to be feared that the supernatural character of that jungle received undoubted confirmation in the native mind when within a week I was being carried down to the coast in a seriously mangled and apparently dying state. Suntul walked all day and every day beside my rough bark-litter; and when the coast was reached and the inevitable parting came he wept bitterly, and throwing himself on his knees beside me, exclaimed, 'Ah, Tuan, did I not say something terrible would happen that day we heard the *hantus* talking in the *lalang*? For *hantus* they were, Tuan, whatever you may say.'

Well, who is to say which was right, the white man or the brown? I have thought over it many a time since, and can best describe my conclusions in the words of a canny old Highland gillie who invariably wound up his most startling tales by adding, 'Noo, I wad not be saying it was a ghost; but it was a fery straange thing whatever.'

THE CAHUSAC MYSTERY.

CHAPTER VIII.—AGAIN.

THE music ran on as Malcolm Cahusac passed slowly up the familiar staircase with the crowd. It was some time before he saw Alice Lanceley, who was sitting rather apart. De Sarsan, standing beside her, was talking with a good deal of animation, and evidently held the girl an interested listener. Cahusac had leisure to notice a good deal, for the rooms were very full, and it took some time to work round to the spot he desired to reach.

'Ah, it is M. Cahusac!' De Sarsan turned quickly; he had seen a subtle change in the girl's face, and the interruption annoyed him profoundly.—'You are late, monsieur. Mademoiselle is already fatigued with saying "Thank you," "You are very kind," to those whose good wishes she has already received.—Is it not so, Miss Lanceley?'

Alice blushed a little. 'I do not feel too tired to say one more "Thank you" to Mr Cahusac—that is, if he means to congratulate me.'

'Mademoiselle to-day attains her majority,' explained De Sarsan.

'I should remember that, for I had the pleasure of giving Miss Lanceley my good wishes and—and a doll just ten years ago.'

Alice laughed. 'And Wil's terrier ate her, don't you remember? I have her head still; nothing else was left of her.'

De Sarsan relished these 'Don't you remembers?' very little.

'I hope your gifts are not always so unlucky, monsieur?' he remarked. 'But we have not heard your good wishes for this happy day.'

'I shall wait to offer them until M. de Sarsan has gone, Alice,' laughed Cahusac. 'He has heard too many, and is prepared to be critical.'

'M. Cahusac is, I see, an undisguised Imperialist,' the Belgian said with a vicious playfulness.

'What do you mean?' said Alice, looking from one to the other.

'Imperialism is your national sin, mademoiselle, and each individual desires to usurp according to his opportunities. He ousts his neighbour when he can.'

'Only in the hope of adequately replacing him,' said Cahusac good-humouredly.

'Do they not say "Imperialism is England"?' Alice put in, using a phrase that had not much meaning in her own ears, but which

she hoped might somehow serve to allay the storm.

'Imperialism is England! Exactly.' De Sarsan lost his acquired deliberation of manner and spoke volubly. 'A handsome name for a crime.—Pardon, M. Cahusac! For so small a man, John Bull has been a wonderful thief!'

'M. de Sarsan and *L'Œil* equally disapprove of us as a nation,' Cahusac said, drawing a bow at a venture.

De Sarsan became exceedingly grave. 'You mistake, monsieur. *L'Œil* is no longer the organ of my party. It has ratted, as you call it over here.' He resumed his air of pleasantry. 'And it is acknowledged that no enemies are so embittered as those who have once been friends.'

'What was it all about?' Alice turned to Cahusac as the Belgian moved away.

'About nothing—the usual cause of disagreements, you know.'

'You are laughing. You don't like him?'

'Not especially perhaps. Probably a prejudice. I hope you do not mind very much?'

'I do, rather,' she replied. 'He is a friend of Wil's, and I am grateful to him. He has a good influence over Wil, I am sure.'

'That is the best I have ever heard of him. But now to speak of yourself. I have no doll to give you to-day, only my good wishes. What is the best thing I can wish you? Happiness? I will wish you happiness now and always.'

'I don't know that coming of age is a matter to be congratulated upon. I don't think it will make me particularly happy,' she said with a natural pathos which sat well upon her. 'After all, perhaps it does not matter. I was taught by my old governess that happiness is not the best thing in the world for one.'

'I cannot at this moment recall a better thing, or I would wish you that also.'

As he spoke Lady Madesson crossed the room in front of them with Wilford. She was plainly very bored; her brows wore a little frown, and she was looking listlessly about her, scarcely listening to Wilford's laughing talk.

Alice watched them pass, and an unwonted hardness settled round her mouth. 'Happiness and prosperity make people selfish,' she said. 'Love is better, even if it demands self-sacrifice.'

'Then I will wish you love also, but not the love which asks for self-sacrifice. That is not a satisfactory sort, in my opinion.'

'But it is the highest. You know, I have often thought'——

'What were you going to say?' He took a seat at her side, for her low replies scarcely reached him.

She gave him a half-timid glance. 'I have thought that you knew something of self-sacrifice. You are not like other young men.'

'Do you credit me with this also, as well as a secret sorrow?'

His face was looking down into hers, and she bit her lip at the expression of mocking amusement which grew out upon it.

'I wonder if you recollect our talk at Fetterings? I am very unwilling to upset your theories, but I cannot pretend to a virtue not my own. I assure you that love has never had anything to do with me; therefore self-sacrifice—in your reading of it—has no concern with me either.'

'You hurt me when you laugh at me like that.' He puzzled her with these transformations—at one moment kind, his real self; the next mocking, far off, incomprehensible. She could only retire upon her own simpleness of heart, and working outward from that point, she occasionally sent her answer home. 'Why do you sometimes try to pretend to me?'

Cahusac knew her too well to be taken by surprise. She interested him by her curious mingling of simplicity with a natural power of insight. He acknowledged that, in spite of her gifts of heart, she lacked the mental strength to use them to advantage; and yet he knew, had fate allowed, how dearly one man at least could have loved her.

'What do you want me to be?' he asked. He had meant to say something very different, but the question came involuntarily.

'I only want you to be your real self always—with me,' she answered. 'I do not ask you to—to tell me anything you don't wish to confide to me. Wil says girls are not of much use in that sort of way, because they don't understand. Very likely it is so. I hardly know how I am to make you see what I should like you to do. I dare say it will seem small and silly to you. But I know you are lonely in yourself, and I—I am lonely too. Perhaps you will laugh at me for saying this, but I thought it would help us both to understand one another. I should see when you were sorry, and you would know if I'—— She stopped with a quick intake of the breath. 'Don't laugh! What is there in your laugh that hurts me so?'

Her appeal shook him. The suggestion, girlish as it was, touched and attracted him. She was very young for her age, but youth has infinite possibilities. What a woman she might become! He could not allow himself to dwell upon the thought. That shadow out of the past might yet overtake him. He must ask no woman to share his unstable fortunes. If his step-mother had believed that vile story, would the world be less credulous?

'I am a brute if I have ever hurt you in any way, for you have always been a'—he chose out a term with difficulty—'a rest and a restorative to me. You have given me back some part of my faith in goodness. You cannot know how much you have done for me by that alone. But

I dare not take your kindness, because it would become indispensable to me. Once I had had it, I could never do without it again. In one point you have guessed the truth. I am solitary, and must always remain so. I cannot accept friendship.'

Alice sighed rather wistfully. White arms, white garments, and fair face in its soft halo of curls; too good and pure and sweet for any man, he thought, as he looked at her.

'You know best,' she said at last. 'But I am glad you told me just a little even of your real thoughts. I can be sorry for you; though why we—— But you know best.'

'I am afraid it is not best—for me at any rate; but it is needful.'

'I was right about you in one thing! Was I not right, too, in saying that you sacrifice yourself?'

'If I do,' he said more lightly, 'my vows are none of my making. They were made for me, perhaps, at my baptism.'

Wilford came up as he spoke, and, with a cool word or two to Cahusac, took his sister away.

Cahusac strolled about the rooms, speaking to one and another. He was a little absent, but no one could have guessed that the past and the present were raging furiously in his mind.

After midnight he made his way downstairs. He would not leave the house without seeing again the four walls within which he had spent that April night six years ago. Yet when he reached the closed door he stopped.

While his hand lingered on the handle he jerked a look back over his shoulder with the instinctive feeling that some eyes were fixed upon him. Detching, who was descending the staircase, nodded down to him, and then turned and went up again.

Cahusac opened the door. From behind a screen which stood immediately inside, and similar to one which had stood there in his recollection, came a murmur of voices.

'But you do not understand, Wilford.' It was Alice Lanceley's voice. 'I promised. I actually signed the paper you brought me.'

Wilford laughed discordantly. 'You are a little goose! Do you suppose a man binds himself by his signature? Lord, I hope I may be damned for no worse! It is only a form, my dear girl; it means nothing.'

'It is a promise,' Alice urged rather hopelessly. 'I must keep a promise.'

'Oh, I say, look here, De Sarsan; just listen to her!—My good child, we were taught to think so when we were young, but it is not a working principle in life.—Tell her, De Sarsan.'

'Mademoiselle is right,' De Sarsan began, and stopped.

The words had been spoken quickly as Cahusac appeared, then turned to leave the room again; but he found some one behind him, who took him gently by the arm and led him forward.

CHAPTER IX.—AN OFFER.

THE three people in the room were standing together at the farther end by the window. Lady Madesson, with a mere glance in their direction, guided Cahusac to a couch that stood against the wall almost opposite to the door. Although the others continued to talk in low tones, she was well aware that she and her companion occupied the attention of at least two of the group.

'It looks as if they were bullying your friend Miss Lanceley,' said Lady Madesson.

'I have known her since she was a small child, but I don't flatter myself that she regards me as a special friend,' replied Cahusac.

'No? Well, at least I gather you are interested in her,' was the pointed rejoinder. 'And because she interests *you*, I should like to be kind to her; but she does not in the least take to the American element.'

'But you like her?'

Lorrie bit her lip furtively, for his tone implied not doubt but certainty. 'You rather expect me to say "Yes" with enthusiasm,' she replied; 'but that is beyond me. Though I can see there is much in her to like—that most men would like'——

'You don't like her, then,' said Cahusac with equal certainty, but evident indifference.

'I don't love her,' returned Lady Madesson, with an inflection on the verb that made Cahusac smile, it implied so much; 'but I would help her, and—and could help her, if only somebody would take the trouble to damp out the starch. As she stands, she has the makings in her of a first-class social martyr. And I have no patience whatever with martyrs.'

Wilford Lanceley crossed the room as she spoke, and threw himself into a chair which he brought close to the couch till his knee touched Lady Madesson's skirt. She drew away with a deliberate and cold annoyance.

'Do you imagine yourself in a crowd?' she asked. 'Because, I assure you, there is plenty of room for you elsewhere—outside the door, for example.'

'Oh, come, Lorrie, that 's a trifle heavy! We 're all friends here. Cahusac knows.' Wilford laughed with his charming, boyish impudence.

'What do you know, Mr Cahusac?' Lady Madesson turned upon him.

'That if I were he I should offer you an apology,' Cahusac said with point.

'Thank you.'

'My dear girl, if that 's all, I apologise. Let 's be proper, by all means; but one never knows where to have you. You are pleased one day with precisely the thing that vexes you on the

next! Come, confess you are cross to-night! And what's the use of it? He knows'—raising an eyebrow towards Cahusac—'and I know, and —you know.'

'What?' The deep, full note of the question almost stopped him.

'You have a beautiful voice, Lorrie,' he said. 'I love it—and you!—and all the world knows! So that we are only enacting a pretty little comedy, we three, for whose benefit I can't for the life of me conceive; it is a bit of make-believe. But'—the real ardour of his infatuation for her breaking through—'Lorrie, I can't stand it! I can't stand even a pretence that puts you farther from me. Even a make-believe of this sort kills me!'

Her clear eyes were on him. 'I almost wish it would kill you at this moment!' she said with a slight lift of the eyelids which seemed to let out a flood of blue, scornful animosity upon him. 'Cowards like you exist to ruin lives and reputations. I am not afraid to speak and to call things by their blunter names. It is a comedy and a make-believe on your part. I perfectly understand your motive, and I am not at all afraid of you. You are as crudely familiar as a rude boy, only you have not the excuse of boyhood, because you wish to give Mr Cahusac the impression that I permit you to be on these terms with me at other times.'

Wilford smiled meaningly. He believed he had a strong card left. 'Now, why in the name of all that's reasonable should I wish to give Cahusac—Cahusac in particular—such an impression?' he asked.

Lady Madesson did not flinch from the answer, as he had expected. She meant to win Cahusac eventually, if she found she really wanted him, of which she was not yet quite sure; but in the meantime she could not submit to be browbeaten by Wilford's insinuations. 'Because you are jealous of him,' she replied quietly. 'And because you fancy this insinuation of yours is precisely the thing to disgust a man of his character. Now at last you know, and I know, and he knows—as you said a few minutes ago.'

Wilford's temper got the better of him. 'Yes, Cahusac's knowledge of the case is almost as good as our own. Don't flatter yourself that he knows no more than you have wished him to see! He knows that I am regarded as your accepted suitor. You have had no end of flirtations; but in spite of all your capriciousness, Lorrie, you're mine. London has too many eyes and ears; clever as you are, you have not blinded her! Ask Cahusac himself,' pointing at Malcolm. 'Why, you can see how much the man knows by the very face of him! Ha, ha, ha! It's a good joke, upon my word! Ask him, Lorrie, and see what answer you will get if you put him on his honour. Good-night, beloved! You want to get rid of me for the moment, but *on revient toujours*'—— With that he rose, bowed, and walked out of the room.

Lorrie paused for a second's scrutiny of De Sarsan and Alice, but they appeared to have some engrossing subject of conversation. Then she turned back to Cahusac. She was looking extraordinarily beautiful in her anger; the grand moulding of throat and chin lent power to her expression. There was nothing petty or narrow about this woman, with her strong nature; she might sin perhaps, but she would sin superbly, like those black-haired Roman matrons whose beauty she shared.

'We have come to know each other pretty well,' she began, 'since we met at Fetterings. I don't in the least mind telling you that you have interested me, as many a clever and original man has interested me before. I scarcely know yet whether you are worth any stronger feeling; but you are resolute, and you can be sincere. Besides, it happens that chance has put us on the same side. You don't know what I mean? Well, this. You are fighting a battle; perhaps you don't comprehend how remorseless your enemies are. To-night Wilford Lanceley has shown me that I am in much the same case myself. You must have heard, of course, that he wants me to marry him—the news has been common property for some while past; but he has never until now tried to force me to do so. There is some new influence at work.'

'He is a young ass; but I've known him a long time, and I do not think he could have behaved like this unless he had been—well, not quite responsible.' Cahusac felt the awkwardness of the position far more than the lady.

'He may be rather tipsy; he usually is nowadays,' said Lady Madesson; 'but that does not account for it. No; he is acting on the advice of some one else. The man who is behind him, who is prompting him, is not my enemy, but is merely working towards an aim of his own. Women see so much, especially women like myself who are alone, who are at leisure to observe, who have no belongings to plot for, no personal advantage of any kind to work toward or gain. The man I speak of is not my enemy, but he is yours.'

'I suppose I am hated much as other men are,' Cahusac said unconcernedly—with any other woman the conversation would have seemed to be growing slightly emotional and absurd, yet somehow it was not so with this one—'but I don't know that I have any such special enemy,' he ended.

'Oh, why fence with me?' She frowned impatiently at him from under her level brows. 'I am in deadly earnest, and so is—De Sarsan.'

A flash came into the young man's eyes, but his voice was half-amused still. 'De Sarsan! What about him?'

His smile stung her. She had meant to approach his confidence gently; but she believed

in his danger, and was perhaps also not averse from proving the value of her opinions and her warning. 'I have a notion that he may know almost as much about the tragedy of this house as you do!'

The colour was struck from Cahusac's face as if by a blow. His lips kept themselves close in a spasm of recollection. He did not speak.

'Poor boy! you are very human after all,' she said pityingly; there was much of motherhood in her. 'Listen. You have your reputation to save, and I have mine. We can fight better together than apart.'

'My reputation to save? I did not know'——

'Then you are blind, and your friends too! Have you not seen the articles in the *Gas-Lamp*? It is a scandalous little paper, but every one reads it. It has lately had some articles "About Foreign Office Officials Past and Present." They are still dealing with the past, yet to-night there are strange hints which seem to me to concern you. See, I have brought the cutting for you.'

He took it mechanically from her hand. This resurrection of the past—ghosts rising on all sides of him—staggered his senses; he half-lost control of his judgment. The question he longed to ask was, where had she acquired her unaccountable knowledge? And yet to ask would be to admit.

'You want to know where I learned all this, how I found it out? You believed it to be so carefully dead and buried,' she went on softly, as if meeting his thought. 'That is easily answered. I told you that you interested me. It was this very story about your father that gave you interest in my eyes when I first met you. Since then I have tried to hear all I could about it from one source or another. But it was he, De Sarsan, who put me on the right track. Only a close friend—or an enemy—could know so much. I arranged the facts I gathered from various people, I inferred this and that from things I saw and heard, and joined it all to my knowledge of you. It was quite simple. And then I recognised the wisdom of the course you have pursued in quietly carrying out your original plan of life, and giving no cause for comment or gossip. People had forgotten your family tragedies; but some one is making it his business to rake them up now, and it is time you were on your guard.'

'I am very grateful,' Cahusac said, 'for your kindness.' He added no more, though she waited for it.

'Very well,' she returned; 'think over it, and remember that if I can help you, it is more than probable that you can help me. Come in on Friday evening, if you care to talk further about it.'

De Sarsan and Alice were moving, and she rose also.

At the same moment the handle of the door turned, and Detching stood in the opening. The Belgian and his companion paused to exchange a few words with the other couple. There was a brightness in De Sarsan's eyes; events which pointed toward success had excited him beyond his wont. He felt strong enough to try a fall with fortune.

'You will remember this house, monsieur?' he said, addressing Cahusac.

Cahusac smiled, a frozen smile of distant politeness. 'Naturally I recollect it very well indeed. And you, M. de Sarsan, do you happen to recollect it also?'

De Sarsan's face continued still amiably imperturbable; but Detching saw the fingers of the hand which he held behind his back twitch suddenly. 'I enjoyed the pleasure of Lady Cahusac's acquaintance for some years. Her loss occasioned a gap in her own circle which has never been filled,' he replied with an audacious relish for the under-meaning of this speech.

Then he turned with Alice Lanceley on his arm. Detching, who was still in the doorway, drew aside with an apology.

De Sarsan stared at him as he passed, and on the stairs asked his companion if she knew who he was.

'I think he is a friend of Mr Cahusac's,' she answered.

'I've seen him somewhere before,' De Sarsan said half to himself.

'Very likely. He and Mr Cahusac are about together a good deal.'

'Ah! ah! that explains it of course.' But not satisfactorily to the Belgian's mind. He, who never forgot a face, could not succeed in placing this one in its specific niche of memory.

(To be continued.)

FLORENCE YESTERDAY, TO-DAY, AND TO-MORROW.

By May Baldwin.

THEY jostle each other as they stand side by side, visible to the eyes of even the most unobservant and Philistine tourist—the Florence of yesterday and to-day—the former with its Palazzo Vecchio standing in the Place of the Signoria, where all the happenings of the city took place, where we stand maybe on the stone marking the spot of Savonarola's martyrdom, and, looking down, see (carved in bas-relief which relates his tragic end) the grim, ascetic face of the great Dominican preacher and reformer as they saw it of old—the

Florentines of yesterday—when he was thundering out his denunciations of their vices and wickednesses, plain speaking which cost him his life. For a moment we live in Florence of yesterday, and see the great Duomo filled with an eager, intelligent crowd hanging upon the words of the famous monk as he preached to them; for it does not need much imagination, as we stand in that Place of the Signoria, which more than any other part of Florence has kept its ancient appearance, to see the Florence of yesterday, nor much more acquaintance with the history of Florence than is to be found by the average tourist in his Baedeker, to people the Place of the Signoria or Lords with the turbulent crowds of old. The Guelphs and the Ghibellines were clamouring always for freedom, more indeed than any other city of Italy, and falling more often than their fellows under the yoke of some so-called leader to freedom, mostly a dweller in one of the many palaces of massive, rough-hewn stone, with their iron-barred windows, which stand there grim and forbidding, as if defying time and modernism to oust them from their place of honour, and frowning down disdainfully on the painfully new buildings which are springing up everywhere in Florence to-day, and crowding out the picturesque and historic buildings of yesterday. There, too, we can see the Florence of yesterday in its 'bel Giovanni,' the beautiful Baptistery where the Florentine babies—from Dante and before him, down to the poorest Florentine of to-day—are all made Christians in the massive stone font; its Duomo of gleaming marble of to-day, and its bell-like dome of yesterday; its nobles' mansions—palaces, they call them—the Pitti Palace (where we go to see the originals of our favourite pictures), built by a proud Florentine noble who boasted of building the finest and largest palazzo in the city, and who exemplified the proverb that 'pride comes before a fall,' for he did not live to complete his palace, which has now passed to the reigning family in Italy, and is used by them when they come to visit the Flower of Italy.

There, too, stands the old palace of his rival, Strozzi, who, hearing this vain boast of the noble Pitti, retorted that his palace should have not size but quality to recommend it, and forthwith gave a commission to a fine worker in metal to make him four splendid lanterns, one for each corner, where they stood, the admiration of the artistic world, until their beauty tempted a thief to steal one; but how any one was able to accomplish the feat the Florentines have not yet been able to explain. We honest Britons of to-day stand, Baedeker in hand, and gaze with admiration, real or affected, at the graceful wrought-iron lanterns, and read how the artist, not having the wherewithal to live upon while he fashioned them, begged an onion from a passing vendor, and by the compassionate giver's advice sat outside the palace eating his scanty fare, and so shamed his patron into giving him the money he needed. This, they assure us, is the origin of the spikes on the lantern which are supposed to resemble an onion. At any rate, we buy tiny models of these iron lanterns in silver if we cannot afford to get the more exact and cumbersome copies in iron, either because we do really admire them or because other people do; and we try to imagine the town lighted by torches and lanterns, a difficult matter with the electric light throwing its brilliant beams round us.

But it is Florence of yesterday that we all come to see, so we stare hard at the house where Dante lived—that is to say, at the house standing on its site; and, thanks to pictures and post-cards which have made us familiar with the features and chief incidents in the life of the great poet, we see in imagination the melancholy, dreamy face of the proud and lonely man; see him striding through his beloved Florence which was to treat him so badly, or standing on one spot for hours absent-mindedly reading some rare manuscript; or, if we are young and romantic, we picture him meeting Beatrice on the bridge of Santa Trinita. Then, with eyes that are disapproving, in spite of Lord Acton, we read the tablet that tells us that Niccolo Machiavelli, the cynical adviser of princes, lived in a small house in one of the most narrow streets of Florence. But even if we are not acquainted with this much of its history and its great men of the past, we all know its artists, and crowd to its galleries where the masterpieces of the Old Masters are to be found.

From the Florence of to-day we turn with distaste, condemning her tramway-cars, which are almost as wide as some of the streets through which they pass; feeling the incongruity, while we patronise them, of the numerous tea-rooms instituted for our benefit, aware that we should have done better to fall into Italian ways, and eat twice a day instead of introducing the habit of drinking hot tea and eating rich cakes under a blazing four o'clock sun.

It is disappearing fast, the Florence of yesterday, in spite of desperate efforts to retain it by those who really love it and those who know its commercial value; and happy are those who see it now before it has vanished quite, and left only Florence of to-day. They jostle each other, too, the Florentines of yesterday and to-day; but the eyes of the tourist cannot distinguish between them; no, nor the average villa-dweller or member of the immense British and American colony, although they may and do intermarry with them both, the Florentines of yesterday and to-day, and strive to become Florentines too. But this they never do, but remain foreign, and make their spouses quasi-British, American, or whatever nationality they may happen to be themselves, producing in their children the Florentines of to-morrow. To them (as to all

foreigners), in their secret hearts, even if they intermarry, the Florentine of to-day—and so they designate all living Florentines — is a degenerate in that he does not produce the sculpture or painting of old.

As for the majority of Britons who travel in Italy, if they know any Florentines beyond the shopkeeper who charges them exorbitant prices for the souvenirs or curios they buy, or the hotel-waiter whom contact with wealthy foreigners has demoralised, they find them pleasant, well-mannered acquaintances, whom, however, they persist in believing incapable of sincerity either in speech or friendship. Not that they have proved them to be so more than their own countrymen; but it is a tradition that the Italians are a hot-tempered, insincere race, loving the sun, in which they bask rather than work; and this in spite of the smiling vineyards and well-tended olive-groves and rice-fields through which they pass; in spite, too, of the fact that we have our wireless telegraphy of to-day from the lazy Italian, as we had our telescope and many a scientific discovery from him yesterday.

But if the foreigner does not know the Florentine of to-day, even if he is friendly with him and exchanges dinners and visits with him, still less does he know the Florentine of yesterday, with whom, as a rule, he does not hold social intercourse, and whose existence, if he reads this article, he will probably deny, thereby giving another proof of his non-acquaintance with him. For he does exist, the Florentine of yesterday, looking down just as disdainfully upon the Florentine of to-day as do the old palaces upon their newly built neighbours; fearful also that they, like their palaces—they all inhabit palaces in Florence—will be thrust out of sight by their fellows of to-day. Fearful with good reason, for the Florentine of yesterday, a hundred years behind the times, and hating the change he sees taking place around him, is not likely to win in the race of life. They do not know the foreign colony, these Florentines, neither the Germans nor Austrians, with whom they have no natural affinity, nor the British or Americans, on whom they look askance as the importers of manners which they do not like, and luxuries of which they do not approve nor see the necessity of. Therefore they will not employ a domestic who has been taught extravagant ways and perhaps liberal views by the luxurious British, who have an elaborate breakfast the first thing in the morning, and consequently spend large sums on fuel for cooking, as well as for heating their rooms, a thing unheard of among these Florentines. So they stand apart, clinging to their old habits and customs, eating their slice of bread and drinking their small cup of black coffee in the morning, sometimes not even sitting down to do so; and they sit in their cold, comfortless rooms with a chauffe-rette under their feet, unconscious either of cold or discomfort, living a simple life on two light meals a day—if we except the morning bread and coffee—and declaring that much eating prevents much thinking, and that the cold lasts for so few days that it is not worth while to trouble themselves by lighting a fire either in Florence or in their palazzos in the country or among the mountains unless their castles or villas stand very high. Everywhere the life they lead is just the same as that which was led by their grandfathers a hundred years ago, in town as in the country, where they use the same primitive ploughs and instruments of husbandry, and practise the same primitive method of making olive-oil in a press turned by huge white bullocks, and the same simple method of making wine. They will have naught to do with such modern customs as Christmas-trees and Christmas gifts, but keep Christmas Day as a religious feast, and give their gifts and make merry at the Befana or Epiphany, the 6th of January, which was the day the Babe of Christmas had His gifts. On that day they still give cinders and potatoes to the naughty children, and presents only to the good ones.

But they know that they are of yesterday, and that their children must be of to-day or fall behind in the race of life; and one by one, reluctantly and with strong resentment at the necessity, they send them to schools they hate, to learn manners and views they hate and shake their heads over; and thus one by one the Florentines of yesterday, like their palaces, are disappearing with the march of time, their place being taken by the Florentine of to-day, who plasters his city with quotations from his famous poet, of whose work he may be proud, but not a word of which he believes. The Florentines of yesterday and to-day teach their children Dante, and now, as of old, lectures are given yearly in the hall set apart for the purpose; but to the children of the Florentine of yesterday Dante's *Divina Commedia* (it does not bear translating) is an inspired description of a future state in which they firmly believe, but about which his schoolfellow of to-day does not as a rule trouble himself.

And the Florentine of to-morrow? According to himself he will be the citizen of a Florence which will be great as of old; having had two mighty epochs of greatness, he assures you that everything points to his country having a third. He is proud to call himself an Italian rather than a Florentine, so he pulls down the solid old palaces and picturesque buildings of yesterday to erect in their place others which are neither beautiful nor so durable, however hygienic and up to date they may be; while he dreams of a great United Italy, whose greatness, he acknowledges if hard pressed, will be founded upon reason and that liberty for which the Florentine of all times has ever clamoured loudly and fought furiously, the which liberty, like the Blue Bird of Maeterlinck, ever and for ever escapes him.

MOANING BAY.

CHAPTER III.

LOUDOUN turned suddenly on his heel. The poor sailor's brain was affected, he thought, by his fight with the murderous sea. He pictured him wandering in the dark on the long, cruel beach, or perhaps lying in some corner dying alone, like a beast of the field. His heart filled with remorse at having left him for a moment, but there was only one course practicable now. His matches were exhausted; so were his cartridges. He might shout and search alone for the castaway for hours without finding him. He made up his mind to go to the lighthouse for lights and assistance, and went off at a steady trot. He was in good training; but the night was pitch-dark, and the soft sand-drifts were leaden fetters on his progress. However, he went on gamely for hours, it seemed to him, the eye of the lighthouse his guide, until at last he neared the goal, the great broadening glare from the column a welcome sight after his weary tramp in the dark. As he was climbing a sand-dune, his foot caught in the tough, entangling 'bents.' He fell headlong, plunging down the slope, his head striking a stone. He rolled to the foot and lay senseless.

An alarm had been raised at the shooting-lodge when 'Donald' came home blown and riderless, along with 'Duke' the spaniel. A search-party was organised, and an intelligent member of it, a collie belonging to Finlay Ross (one of the lighthouse-keepers), found Loudoun late that night. The good dog's barks brought his master hurrying to the spot with a storm-lantern. Finlay's knowledge of first-aid was limited to the prompt administering of whisky, but Loudoun was not seriously hurt. Providentially (for the exposure might have ended a weaker man) he was warmly clad, and had fallen into a hollow, well out of the wind. He had received a nasty scalp-wound, and was stunned; but there was no concussion. The stalwart Finlay lifted him, and carried him to the lighthouse, which fortunately was close at hand. He rallied somewhat, but talked with little coherence, and the lighthouse-keeper forbore to question him. They just managed to get inside the lighthouse, when Loudoun fainted. The good Finlay did probably the best thing in the circumstances. He carried him to bed, covered him with warm blankets, gave him more Talisker, and sent his fellow-keeper off for the doctor, who arrived in the small hours, drenched with spray, muffled up to the ears, a gray-haired, ruddy, kindly gentleman. He had been out with some of the search-party at the cliffs five miles away.

The old doctor's life had been spent in fighting the Enemy among the scattered poor of the island. Not of this earth his reward, nor that of many another obscure devotee to duty in these lonely outposts.

'He 's been restless, and haverin' a bit, talkin' to himself aboot a wreck or something,' said Finlay.

'Imphm!' said the doctor, as he looked at Loudoun's knock on the head and felt his pulse. 'About normal! He 'll be all right wi' two or three stitches,' was his verdict. He thawed himself leisurely at the fire and mixed and drank a tumbler of toddy. Then he woke Loudoun, stitched the wound, and gave him a hypodermic.

'I 'll bide here until morning, Finlay,' he said when Loudoun was asleep. 'I 've had a long day, and I think I 'll lie down;' which he did. 'You or your mate, give a look to him and call me if ye want me.'

It was early morning when Loudoun woke, to find the doctor beside him. The events of the night before gradually pieced themselves together.

'You 'll be all right in a day, Mr Loudoun,' the doctor was saying. 'Your "sheltie" and the dog came home dead-beat. They must have been going a cracker, I can tell ye. Of course we sent out search-parties at once, but we had no idea where they left ye. 'Twas lucky Finlay and his dog found ye, for pneumonia 's a kittle chiel'. I 'll drive you home in the afternoon. Your adventures can keep for half a day, for'——

'No, no, doctor! that 's just what they can't,' interrupted Loudoun. 'The poor beggar from the wreck—— We must go back. He may be lying there yet!'

'Wreck! What wreck?' asked the doctor in surprise.

Loudoun told the two men hurriedly the outline of the story of his finding the dripping castaway, and finished up with, 'He must be found, dead or alive! I 'm fit to go back now, and I 'm going.'

The doctor shook his head. But Loudoun was determined, meeting the doctor's mild expostulations with an uncompromising obstinacy. There was nothing for it but to make the best of his 'maun to Cupar' rigidity of purpose.

'I 'm going!' he repeated.

The doctor surrendered. 'And I,' said he.

'An' me,' said Finlay.

'It 's dark yet; but in a quarter of an hour or so we can start, and reach the place by daylight. Did the man remember the vessel's name?' asked the doctor.

Loudoun thought for a moment. 'He did, and told it to me; but I declare I have forgotten it for the moment,' he said. 'It will come back

to me, no doubt; but it's of little consequence, for we'll hear it soon enough.'

Finlay brought some steaming coffee, and, after a light and hurried breakfast, in a quarter of an hour they were tramping along, carrying storm-lanterns, and going as quickly as the half-light would permit, for early morning is dark enough in November in these latitudes. Half-an-hour passed. Finlay halted, and swept the beach with his glass.

'Nothing; but it's hardly licht yet,' he said. On they went again.

'It's sad work reconstructing it from memory,' said the old doctor as they walked along; 'but the weather calls to my mind the last wreck. 'Twas last year, on a Sunday afternoon in winter—just such another day as yesterday; but with a fog earlier in the day, the wind freshening, and the glass falling like a bullet. Finlay here and some others had seen a vessel driven far too near the reef outside "Camus o' Chaoidh." We were at the kirk, I remember. Ye could hardly hear John Sime the precentor's voice for the wind and rain blaudin' the windows. We got word of the vessel's danger at the skailin', and came—minister and all—straight to the beach. I saw her, a brig, lying to, under maintops'l. She would have been all right in middling weather, but she had gone a bit out of her course in the fog, and on the back of it a bad nor'-wester sprang up. In a clap it was blowing great guns. I could just get a sight of her now and then. Once we thought she would weather it. Man, she made a gallant fight!'

'Yess, she did that!' chimed in Finlay; 'she did that!'

'Yard by yard she was gaining. Then came a score of great combers out of the Atlantic, walls of crested seas, to send her staggering back, staggering nearer—nearer—nearer the yeast o' the breakers on her lee. Again she made a point or two, and I drew a long breath of relief; but the next glint I got of her froze me. Lord! her foremast had snapped and hung dangling, and she was coming broadside on like a racer half a cable's length from the reef. We just stood dumb and useless. The minister put up a bit prayer; but it stuck in his throat, poor man! I saw her strike. Ay, once—twice—then a great tearing sound; and then—then—I knew it was coming—a long, dreadful shriek. There she hung on the reef as if on barbed wire. I took the binocular—I wish now that I hadn't—and counted ten souls hanging tied to the rigging, among them—peety us!—a woman and a bairn. Next moment a tremendous sea smothered her, and another, and another. I saw her bowsprit rise in a quivering good-bye, as she was lifted high and heaved over into the jaws of the rocks. Then the night fell black with a storm of blinding rain. That was the end. There were no more cries.

'Only one man came ashore alive. We found him on the beach half-an-hour after. He could speak; but, despite all I could do, he joined the others in ten minutes. Ay, it's a cruel coast.'

The doctor brushed the spray out of his eyes.

CHAPTER IV.

DAY broke on a cold sea, the wind blustering, and a long, ugly swell running. It was a cheerless dawn, a dawn to shiver in.

The three men had rounded the bend of the sandhills, and Loudoun led the way to the rock where he had watched on the night before. There he found his gun.

'The spot, sure enough!' he said. 'I found the man on the beach nearly in a straight line from where we stand. Let us hope that we are in time.'

'A coincidence! Tidal currents, likely,' said the doctor, half to himself. Finlay, behind the others, crossed himself. They went down to the beach.

Finlay was examining the soft sand. 'These will be yours, sir,' he said, pointing to some footmarks.

Loudoun compared them with his fresh foot-print. Undoubtedly they were his tracks of the night before.

'And just here is where I found the man,' he said, pointing to the line of seaweed.

'But'—— began the doctor. The three men looked at each other, the same thought seizing them. 'But there are no other footprints! Where are the man's? He was able to walk, you say, and did walk. He was barefooted. We must find his tracks as well.'

But there were none, nor the faintest traces of any human footprints other than his own, and the sand was as impressionable as wax. They could even see the prints of the sea-birds.

'Are you sure of the spot, sir?' asked Finlay.

Loudoun did not reply. He was standing staring at the lightening east, trying to remember something.

'Yes, yes. This is the very place. And—I have it! The man I found here last night told me that the wreck he had been washed ashore from was *The Western Belle.*'

'*The Western Belle!*' came simultaneously from the two men. The lighthouse-keeper's voice shook. The doctor looked at Loudoun's inquiring face narrowly, professionally.

'Impossible!' he said, 'unless there are, or were, two vessels so called, for that was the name of the wreck I've just been telling you about. Lamont, the man whom we found last year, and whom Finlay and I saw die near this very spot, was sent home—poor soul!—to a kirkyard in the Long Island.'

There was a long pause.

'*The Western Belle*, you said, went wrong in the fog. I gathered from the—the man last night that he took the wrong entrance and lost his ship.' The words dropped one by one from Loudoun. He was white to the lips.

The doctor looked at him, his first thoughts upbraiding himself for allowing him to come out, for his patient looked ill, and his words suggested that he was hardly himself.

'Lamont was a pilot,' the doctor said to Loudoun. 'In a mist he mistook—out there—for the Antlers Channel farther south, until he saw Erness Light. Then it was too late. He paid for it with his life—and his wife and his child were on board.'

Loudoun's face was very grave. 'I'll finish it, doctor. Their names were Ailie and Donald,' said he slowly.

'Come, Mr Loudoun,' said the doctor coldly, 'this is unworthy of you. If it is an attempt at a jest or a hoax'—— Then he stopped suddenly at the sight of Loudoun's ashen face.

'Doctor, you will tell me if I am wrong,' Loudoun went on. His voice was hoarse and unsteady. 'Lamont was a very tall man, black-bearded, barefooted, a long scar on his left cheek. He wore a jersey, half-torn off him in his fight with the sea, leaving his left arm naked. The arm was broken, and tattooed on it were an anchor and the letters D. L.'

The doctor stood silent, but the colour had deserted his ruddy face. Loudoun laid a hand on the doctor's shoulder, and the old man saw that his hair was wet, and beads of sweat broke on his forehead.

'I am right?' said Loudoun, looking straight into the other's eyes. 'Tell me, doctor!'

'My God! you are,' was the answer.

'The brig was lost a twelvemonth gone yestreen,' whispered Finlay.

A surge in his blood icy and benumbing swept over Loudoun. He looked swiftly around the beach, peopled as with presences, by the gesticulating shadows of the dawn.

His eyes fell on the rock. The vision of the terror and flight of his dog and pony came to him like a shock, and in that instant, in a strange flash of memory, some lines idly learned in far-off school-days took sudden life, and rang over and over again in his brain:

> For beast and bird have seen and heard
> That which man knoweth not.

'Who was he!—It—last night—I saw—watching—listening for voices from out there.' He pointed to the sea's dark ridges with a shaking hand.

Riding on the rising wind came a long wail from Moaning Bay.

'*Crioeda leinn!*' said the lighthouse-keeper. '*Crioeda leinn!* Let us go home!'

THE END.

MISTRESS AND MAID.

THE MISTRESS—A PLEA FOR THE MAID.

THE onerous duties of a mistress who manages her own household from first to last are by no means easily performed; her position is one of very great importance, and cannot be too highly estimated. By her conduct the whole internal policy of the home is regulated; by her counsels and commands the family and maids are guided; her words and actions will be helping to form their characters, and will elevate or lower them according to the nature of her own character. She will be exercising an influence either for good or evil, and a whole train of causes may be set in operation. By striving to obtain and cultivate clear and true ideas of right, by emphasising these ideas in her conduct, and shedding abroad their radiance through her influence, she will be able to strike the most effective blows at every form of wrong-doing, and to encourage and develop that which is noble and good.

The servant question has to all appearance reached a very serious crisis, and great difficulty is frequently experienced by mistresses in obtaining suitable maids. Their manners, capabilities, and general training seem to be at fault. They are constantly changing, and live in a state of perpetual unrest and dissatisfaction. The fact is, a girl leaves school, and is sent to service knowing little or nothing about the work she is expected to do.* Unless that girl is fortunate enough to secure a situation in a good home where her moral and spiritual welfare will be cared for, and where, under the wise guidance and judicious training of her mistress, she is instructed in the art of housework in all its branches, she is in danger of drifting from one place to another, until at last she is proved to be so incapable as a servant that no one will keep her for any length of time, and her chances of securing a good home are gone. She does not realise how unsatisfactory her services are, and her mistress does not take the trouble to teach

* It is to be hoped that this will soon be a thing of the past. At the instigation of the Board of Education, greatly increased attention is being paid to the teaching of home management in our elementary schools, and the valuable pioneer work done by Miss Hitching, of the Derbyshire Education Committee, is already bearing fruit. Miss Hitching's *Home Management* (2s. 6d.), in which she expounds her ideas and gives the results of her experience, is now in very general use throughout the schools of the country. See advertisement sheet, page 6.

her, preferring rather to take her chance of finding another more suitable.

The training of servants is a tremendous responsibility, and one which requires great tact and patience. Constant watchfulness and repose of mind on the part of the mistress, and the cultivation of an amiable, kind disposition, will enable her to foresee many difficulties and ward off many dangers, and make her strong to exercise the important principles of good government which go towards the making of a bright and happy home.

The fundamental principle of good government is invariably to enforce obedience. When a right command is given, obedience must follow. Any appearance of insubordination must at once be checked, and should not be classed amongst trifling faults. The exercise of discipline may be painful, but it is of the profoundest importance; and if a mistress shrinks from that duty she will expose herself to the sad train of consequences that disobedient servants leave behind them.

There are times when it will be very necessary to censure and show disapprobation of disagreeable conduct, and to point out faults and failings; but it must be remembered that this should always be done in love. A wise mistress will take into account all the circumstances of the case, and, whilst knowing it to be her duty to administer a reprimand, she will also seize the opportunity to instil the lesson of obedience into the mind of the girl.

To make it a habit of casting the eyes around in order to find some little thing out of place, or to be continually seeking grounds for censure on every possible occasion, is not conducive to happiness. If a servant finds that she is frequently found fault with when striving to do well, she will become soured, her disposition will become hardened, and eventually she will relinquish all efforts to please, and become utterly heedless of reproof, simply because she will anticipate blame as a matter of course. The personal satisfaction she might have experienced in doing things correctly is quenched because of the certainty of getting no commendation; thus the judicious exercise of approbation is of very great importance.

While in all cases real evil must be strongly resisted, there are doubtless many cases of trifling faults it may be expedient to overlook. Girls will sometimes be thoughtless and inadvertent without any real intention of doing wrong, and wise judgment will be required in deciding what may be overlooked. Sometimes a maid makes a most determined effort to please her mistress and merit a smile or kind word, and often the most bitter tears are shed because her feelings and efforts are not sufficiently sympathised with. This lack of interest and sympathy often leads to carelessness and disobedience, when an expression of gratification would have helped to promote obedience and cultivate respect and affection. In order to be consistent and decided in government it is not always necessary to be unduly severe; indeed, it is distinctly improper for a mistress to be harsh, unsympathetic, and forbidding. She will gain more by wise guidance and kindly counsel, by trying to soothe rather than ruffle the feelings of her domestics, and will avoid giving orders in such a way as she has learned by experience will be calculated to excite unpleasant moods. To encourage the girl is to inspire her with hope, to stimulate her powers, and enable her to make fresh efforts. It will also pave the way to pointing out error and faults, and correcting them. By the exercise of control and a little judicious management the desired object may be attained, and the minds of all kept in perfect peace.

The advantage of order and punctuality is of the greatest possible value. The motto of every home should be, 'A place for everything, and everything in its place; a time for everything, and everything up to time.' Meals should be at fixed hours, and this rule should be adhered to and strictly observed by every member of the family as far as possible. Nothing so quickly throws the internal arrangements of a home out of gear as meals the hours of which cannot be depended upon. Picture the scene in consequence. The master, in a state of irritability, rushing off to business at the last minute; children late for school, with breakfast or dinner half-eaten, tempers ruffled, digestion upset; mistress and maid at variance, the atmosphere electric, strength spent in the struggle, and the serenity of the home disturbed almost beyond recovery. Circumstances like these are alarming, and overwhelm the whole household with a sense of unrest and dissatisfaction, all of which may so easily be avoided by orderly methods and the strict observance of punctuality. When a mistress is entering into an engagement with a new maid, it is necessary to make her clearly understand that negligence in this respect will not be tolerated; and by so doing the mistress will not only be doing her duty, but the maid will see the good sense of this arrangement, and the mistress will receive the genuine reward of respect and affection.

In carrying out a system of order in the daily routine of the home, one of the most essential things is early rising. When a good start is made in the morning, it will be found that the various duties of the day will be much more easily accomplished, and will considerably help to make the domestic wheels run smoothly. To be even five or ten minutes behind time is sufficient to throw the working machinery of the home out of order, and to cause dissatisfaction and unrest for the remainder of the day; but early rising is impossible if maids are not allowed to retire until midnight. There should be a fixed time for kitchen lights to be out, and on even-

ings when maids are not required they should be given the privilege of going especially early to bed. A little thoughtfulness on the part of the mistress in this respect will be greatly appreciated.

To fail to make a proper distinction between faults and accidents is to be unjust. If a thing is broken carelessly, that most certainly is a fault, and should not be overlooked; but if it occurred purely through accident, and expression of regret has been made, it is unfair to be continually harping on the fact that such and such a thing was done. A mistress needs very great control over her feelings, or she will be continually provoked even to acts of injustice by what are really the misfortunes of her innocent maids.

Economy also should be evident in every mistress. It is a very important home virtue, and should always be practised, even though the income be a large one, which fact will relegate the question of ways and means into the background. To allow extravagance or waste is sinful. To be competent to manage a little or a lot is a real merit in housekeeping, and to keep well within the bounds of the housekeeping allowance is to be commended. While economy and frugality are important virtues in the home, they must never be allowed to degenerate into parsimony or meanness.

In conversation with friends over an afternoon cup of tea in the drawing-room a mistress may be tempted to talk about her disappointments and petty annoyances, and led to discuss her servants' faults and failings. This method of relieving one's feelings is to be deprecated. It will be found harmful to mistress, maid, and friend, and will not call forth real sympathy or produce helpful results. It is well when a mistress can regulate and control her own household without calling in the assistance of friend or neighbour, and when she can show, by a judicious exercise of the power her position gives her, that she is capable of managing her own affairs.

Opportunity should be given maids to attend regularly the services of their Church, and the work of the home should be lightened in every way possible in order that this may be accomplished and enjoyed.

THE SERVANT—A PLEA FOR THE MISTRESS.

The pressure of life to-day makes it more than ever necessary that the home be properly managed, its affairs well regulated, and the equipment of its servants of the very highest order. Domestic service at the present time is unpopular, yet it is a most honourable calling, and in no sphere can the activities of young women be better employed than in such service, and in no sphere is there more clamant need for them than at the present time. To be an adept in the art of housekeeping, to understand hygiene and be able to cook and serve food in a palatable, dainty fashion, to be capable of washing and ironing in a satisfactory manner for a family, to be competent to nurse and care for children and attend the sick, is surely a not unworthy position in the social life of the nation.

In our national and social life we all depend upon each other. The maid cannot do without the mistress; neither can the mistress do without the maid. It is only right and just, therefore, that mistresses should interest themselves in their servants' welfare; but it is surely equally fair that servants should study and guard their employers' interests. An inconsiderate mistress and an idle, wasteful servant are equally guilty, and the great question that confronts both is, 'What is my duty?' To neglect to do one's duty is a social sin, and what is urgently required between mistress and maid to-day is the practice of the golden rule, 'Do unto others as you would have others do unto you.' A true sense of the value of good, honest work, and a deepened sense of responsibility to employers, would enable maids to do their duty more adequately, and to fulfil more faithfully the responsibilities undertaken by them.

The unfortunate thing is that so many who offer themselves for domestic service know little or nothing about the work they undertake to do. When they reach the kitchen, pantry, or nursery they are awkward and bewildered, and even the most insignificant of a servant's duties appear to be hard and irksome. The consequence is that everything seems to go wrong. Their views of service and of mistresses become distorted and out of all proportion. Trifles are magnified, the domestic atmosphere becomes sultry, the work gets hopelessly out of gear, tempers are tried, and peace and rest are unknown. Now, how and when can this condition of things be rectified? It seems to the writer that when domestic service comes to be regarded by mistress and maid as a great social profession, the profession of the home-maker, then, and only then, will there be any general forward movement in the position of domestic servants. That there are grievances on both sides is undoubted, and these must be taken into consideration. No wonder a mistress becomes impatient and irritable when her cook, to whom she is giving a good home and fair wages, cannot produce an appetising dinner or keep her kitchen and cooking utensils clean and in good order, or when her housemaid is incapable of making a bed neatly or turning out a room for thorough cleaning.

To the maid we would say: Method and punctuality are indispensable to prosperity. The importance of working on a fixed plan cannot be too strongly enforced. It is easy to see that work done in a haphazard fashion, without order or method, will only result in worry

and discontent. Tasks that appear formidable will begin to disappear when they have been well arranged and systematically attacked. Always begin by planning work so that time, strength, and labour may be saved. Slovenliness of habit in work and person has been the ruin of many a promising girl, and has meant for her a miserable existence instead of a bright, happy life. If servants started their work with a fixed resolve that whatever was required to be done should be done to the best of their knowledge and power, then their anomalous position as 'one of the maids' would be changed, and they would be rated at their true value, and would become trusted helps and friends of the family.

Thoroughness in everything is to be highly commended. All branches of work should be considered important, and nothing trifling. It is not only the cut glass and the fine silver and rich veneered furniture that require special attention, but the kitchen floor and cupboards, the range, the scullery sink, the outside of the back door as well as the front, the corners that are not always visible as well as the more conspicuous places. Thoroughness is a virtue and a just return for payment; while every kind of deception is imposture, and the face should be sternly set against it. It must be remembered, also, that our conditions and surroundings are largely what we make them. Masters and mistresses usually know capacity when they see it, and make a note of it. The old proverb, 'There is always room at the top,' is true in domestic service to-day; thus encouragement is given to strive after excellence in every detail, and energy combined with common-sense is a quality that will contribute most surely to success. To go in for good, honest, genuine work; to make strenuous efforts to turn out only the best; to be conscientious, thorough, honest, truthful, is to merit well-earned praise and gratitude, and to win a career of honourable success.

When the work is felt to be hard and little progress appears to be made, servants are apt to be discouraged, and, without due consideration, contemplate a speedy change. This is not good. And they should beware of the disastrous habit of wandering from one situation to another in the hope of getting 'a better place and more wages.' 'A rolling stone gathers no moss,' and the maid who 'gives in her warning' at the end of a fortnight or month, before she has had time to give the work of the house or its inmates a fair trial, is apt to be led into indolence, carelessness, frivolity, and a want of definite application to work, which will eventually lead to her downfall. It is impossible to find one's niche in a strange and unfamiliar household in a few days or even weeks; it will take courage, patience, industry. And if heart and soul are put into the work it is bound to merit approbation, and will bring promotion in due course.

When occasion to leave and go elsewhere does arise, it is wise never to carry away information regarding the master and mistress. If they cannot be spoken about kindly, then a discreet silence should be observed. Gossip should never be repeated. It is almost impossible to get, or give, a true impression. Exaggeration slips in and false judgments are often formed, and as a result many have been made to suffer needlessly. Any critical discussion of masters and mistresses should be avoided; such criticism often becomes slander, and is a positive injury to society. It is astonishing how a story changes in its character as it passes from one to another, and eventually all kinds of surmises are indulged in.

Truthfulness, even when it may appear against us, should be cultivated. To condescend to falsehood is to lower our self-respect and moral dignity.

'Never to be idle' is a good maxim. When hands are not usefully employed, then attention should be given to the cultivation of the mind. The amount of work that can be done in spare moments is surprising; if we could count our wasted moments we should be filled with wonder and regret.

Then the habit of cheerfulness on the part of the servant will be appreciated in the home. It is a quality that cannot be too highly estimated. A bright, happy nature which makes the best of everything will enable her to display courage and wisdom, promptitude and smartness, and to discharge all obligations. She will also impart inspiration to those she is associated with, and be ready for any contingency that may arise.

Let a maid strive to do her work thoroughly and systematically, and take a pride in giving satisfaction, remembering that all honourable work is noble. It is equally the duty of the mistress to recognise such efforts by kindly interest and general approbation.

EAST AFRICA: ITS PRESENT CONDITIONS.

By JOHN POLLOK.

ALTHOUGH within the last few years, thanks perhaps to Mr Winston Churchill and ex-President Roosevelt, more accurate information regarding East Africa is now common, still it is undoubtedly the case that knowledge of the East African Protectorate is confined to a comparatively small section of the public at home.

Hitherto East Africa seems to have been the Cinderella of the British colonies; but it is hoped that in the present Governor, Sir Percy Girouard, D.S.O., the fairy prince has appeared on the scene, and that in a short time East Africa will take its proper place among progressive British possessions; and the more reliable information the public at home gain regarding the country the sooner will it come to the front and take its proper position amongst British colonies.

When one considers the glowing description of East Africa as portrayed by Mr Churchill, ex-President Roosevelt, and Sir F. Treves, one wonders why there is not a greater number of immigrants and settlers arriving in the country. That there is some reason for this backwardness must be admitted, and to remove this prejudice is the duty of all who have the interests of the colony at heart. The Government officials at home were blamed, rightly or wrongly, as the primary cause of the slowness in the development of the country. It is commonly reported that the Foreign Office looked on East Africa as an appanage to India, and not only were white settlers not encouraged, but they were actually looked on with suspicion by the Government officials both in the colony and at home. This obstacle has now been removed, and Government officials of all classes now admit that the highlands of East Africa are suitable for Europeans.

Of course the effect of the Government's former attitude is still felt, but will gradually disappear. Having helped to keep back the country, it is now the duty of the Government to give the colony a helping hand. This can be accomplished in various ways, and one of the first is to spread authoritative information regarding the country and its resources in such a manner as will enable it to reach the class of people most desired. These are the small farmers and better-class workmen, and every means should be taken to encourage these types to emigrate to East Africa. It is also, nevertheless, the duty of the settlers already in the country to assist the Government in the carrying out of this work. Unfortunately personalities seem to keep some of the most influential settlers from viewing the interests of the colony with clear eyes. This is much to be regretted, as it undoubtedly adversely affects progress. When influential settlers, regardless of the good of the country, take to contradicting and opposing any policy promoted by personal opponents, then the Government have a strong excuse for not actively encouraging emigration. The greatest difficulty to be overcome in a new country is the land question, and in no colony is this difficulty more apparent than in East Africa. The home authorities are blamed for the chaotic position of affairs in this respect, but it is doubtful if all the blame should be laid on their shoulders. Some of the settlers are not entirely blameless over this question, and because of their personal feuds not only do not assist the Government officials, but tend to prevent them from drawing up satisfactory rules and regulations. It is, however, primarily to the home authorities that the present unsatisfactory condition of the land laws is due. Ultra-socialistic views seem to reign at present among the Colonial Office officials, and they evidently regard it as a first duty to see that all the land in the country must, in due time, revert to the Government. It is even already proposed to increase the present rents of the land, and this notwithstanding that there are hundreds of thousands of acres waiting for settlers.

To the ordinary person it would seem to be the Government's first duty to attract settlers and to hold out enticing inducements to encourage them to take up land. If it is stipulated that all the land granted must be occupied within a certain period, and that satisfactory development work be carried out before the land is formally handed over to the settler, then it is not only useless but harmful to talk about increasing the present rents. If the rents are not sufficiently low to attract settlers, then it would seem good policy to lower rather than to increase them.

The land question can, however, only delay for a short time the proper opening up of the country. The agricultural resources are so great that settlers will come despite all restrictions. Some of the best agricultural land lies at a considerable distance from the present railway, and good roads and light railways are required to allow of these lands being developed. It is safe to say that the present Governor is fully alive to the requirements necessary to be carried out. The construction of the railway to the Magadi Soda Lake will serve to open up a new district, part of which is splendid grazing land. This part of the country is at present a game reserve, occupied only by a few Masai, who use it as a grazing-ground for their herds. It is extremely probable that a great part of the land adjoining the railway will be opened up for settlement. The construction of the railway and the working of the soda deposit at Magadi will be of great advantage to the country in many indirect ways. It will be a source of profit to the Uganda Railway, and thus enable the authorities to cut down the freight-rates on agricultural produce. It is well known that traffic makes traffic, and it is to be hoped that the impetus which the new railway will give to the country will not cease for many a year.

There is no denying the fact that the highlands of East Africa have many advantages for white settlers. There are two rainy seasons each year, which are fairly constant in time, although the amount of rainfall is variable. The

climate is delightful, and living is fairly cheap. At present, owing to lack of transport facilities, the country is handicapped, but this defect is common to all new countries. Almost all semi-tropical products can be grown. Wheat now appears to be a proved success; coffee, mealies, potatoes, and fibre have all been proved; and fruit-growing and tea-planting, although not definitely proved, give every promise of success. Sheep-breeding is flourishing, and so is ostrich-farming. Cattle and horses have not yet proved successful, but pig-breeding is doing very well. It is, therefore, only a question of time until this new colony becomes self-supporting and plays an important part in supplying food for the older and more densely populated parts of the Empire.

It would seem as if the Home Government had now awakened to the importance of East Africa as a white man's country. Careful regulations dealing with indentured labour from India have been drawn up, and are being strictly enforced. At present all the artisan classes are Indians, and, practically speaking, all the clerks in the Government and railway offices. The new regulations will tend to reduce the supply of skilled Indians, and thus necessitate the employment of Europeans in their place.

Other improvements will include (1) a light railway from Nairobi, about thirty miles long, (2) a water-supply for Mombasa, and (3) a deep-water pier at Mombasa. All these works are urgently needed; but three hundred miles of light railway, rather than thirty miles, would not satisfy the demand for transport facilities from the outlying agricultural districts. Still, it is a start, and this is an important point gained. Great changes have taken place in Nairobi, the capital of the protectorate, during the last few years; and the writer, returning after an absence of three years, was greatly impressed by the improvements effected on the town in that short period. Substantially built stone houses are now the rule rather than the exception, and the usual colonial type of house of corrugated iron and timber is already becoming obsolete. The value of land in the town has been very steadily increasing during the last three years, and several plots have been changing hands recently at comparatively high prices.

There is one thing urgently required, and that is an agricultural bank, preferably under the control of the Government, whereby settlers can obtain money for developing their farms at easy rates of interest. At present the banks are shy of accepting land in security for loans. In a new country time is required to show what class of agricultural produce is best suited to the locality; and unless the settler has a good bank-balance to draw on, he may spend all his capital developing and improving his land, and finally have to give up the fight and lose the reward of his labour. With a Government agricultural bank to assist him, the settler can enter on his experiments with greater confidence, and with the feeling that his labour will not be entirely thrown away on useless efforts.

The writer would advise all parents who think of sending their sons to one or other of the colonies to give the claims of East Africa careful consideration. Admittedly progress hitherto has been slow, but all the signs point to the country quickly taking its place in the foreground of British tropical colonies.

NATURE'S NON-BETRAYAL.

Nature never did betray
The heart that loved her.—WORDSWORTH.

DEAR Wordsworth, true thy every word!
Dear Nature never yet
Carved one deep furrow, one record
Of sorrow or regret.
She takes us, burdened with our smart,
To woods all grim and hoar,
And 'mid the sighing of the trees
We lose our sighings sore.

She takes us to the pebbly strand,
And shells of varied dye
Wake sunny pictures in our hearts,
And tender looks the eye.
She takes us to the mountain-peak,
So stalwart and so gray,
And there sunrise and sunset speak
Of Heaven not far away.

She leads us to the waterfall
That foams in lines of song
Mirthful and vast, and we recall
The thought that makes us strong.
In every morn, in every eve,
By bird and beast and bee,
Some beauteous vision we receive
And meaner visions flee.

Dear Nature never fails her child;
And at the last we sleep
Below her mantling daisies wild,
Nor ever wake to weep.
As children, lo! we pluck the blooms
And dream our dreams of pride;
At eve they blossom on our tombs,
For ever glorified.

DICKENS AND FORSTER.

By S. M. ELLIS, Author of *William Harrison Ainsworth and His Friends*, &c.

WHEN, during the Christmastide festivities of 1836 at Kensal Lodge, Harrison Ainsworth introduced two of his guests, both young men of twenty-four, to each other, he little thought he was laying the corner-stone of a memorable friendship and for all time coupling together two names—Dickens and Forster. And now, seventy-five years later, what may be termed the coping-stone of that friendship appears in the shape of an elaborate and richly illustrated edition of the oft-reprinted book in which the one friend recorded the life of the other.

Forster's *Life of Dickens* is now generally acknowledged to be one of the great biographies in the English language, and has a place in the select group which includes Boswell's *Johnson*, Lockhart's *Scott*, and Mrs Gaskell's *Charlotte Brontë*. And yet no biography has ever been more adversely criticised. Personal friends of Dickens, who had known him intimately, were dissatisfied with it. James Crossley, the famous bibliophile, speaking of Forster, said, 'I cannot call him the successful biographer of Dickens.' And Ainsworth observed, 'I see he only tells half the story.'

No doubt the views of Dickens's friends were biassed by annoyance at the scant notice they received in the authoritative biography; and this lapse, of course, *is* where the book is most open to effective attack. Forster himself is unduly prominent; but other intimates of Dickens, who very strongly influenced his career and literary work, are relegated to an obscure position, and very often their share in the life-story is entirely ignored and omitted. It is the same with the correspondence; the letters quoted are practically all addressed to Forster, and no attempt is made to utilise the many valuable letters written by Dickens to other correspondents. Further, the documents Forster did use in his narrative are inartistically introduced and cruelly mutilated. Indeed, his method of dealing with Dickens's original letters makes the blood of more meticulous biographers run cold, for, as a friend of his has recorded, 'To save time and trouble—and this I was told by Mr Forster—he would cut out the passages he wanted with a pair of scissors and paste them on his manuscript. As the portion written on the back was thus lost, the rest became valueless.'

It will ever be matter for regret that Forster, with his unique opportunities for a detailed and intimate picture, has given but an incomplete record of perhaps the most interesting period of Dickens's life, the years 1836–39, the outset of his literary career, when the early books were written with all the young, fresh brilliancy of their author. The biographer gives an unsatisfactory version of Dickens's relations and quarrels with his first publisher, Macrone; in fact, he suppresses all mention of the important point that the author had signed an agreement to write, for two hundred pounds, a novel—probably *Oliver Twist*—to be published by Macrone; but that, owing to the dispute and ill-feeling which had arisen between Dickens and Macrone concerning the copyright and reissue of *Sketches by Boz*, Dickens absolutely declined to carry out the contract, and disposed of his proposed novel to Bentley for five hundred pounds, thus risking a legal action, which, however, was rendered inoperative by Macrone's sudden death. These events occurred in the late autumn of 1836.

Forster's account of Dickens's quarrel, some two years later, with Bentley is also open to criticism. There were two sides to this historic separation, as in every other dispute, and both Dickens and Bentley were justified in fighting for what they considered their rights. Judging by the expressed views of his contemporaries, Bentley was certainly a hard man to deal with; but it does not follow that he was quite the rapacious taskmaster depicted by Forster in his earlier pages. Here we must make allowance for the biographer's affectionate bias towards his friend-hero.

The facts of this matter were that when, in 1836, Dickens first entered into his arrangements with Bentley his great success and fame were not as yet; and he, a young man of twenty-four, was glad to undertake the editing of *Bentley's Miscellany* for twenty pounds a month, and also to write two serial stories (*Oliver Twist* and *Barnaby Rudge*) for the sum of five hundred pounds each. But the phenomenal success of *Pickwick* and the increasing public attention now given to *Oliver Twist* naturally changed the situation; and so in 1837 Dickens's editorial

 [*All Rights Reserved.*]

salary was increased to thirty pounds a month, and the price for the novels to seven hundred and fifty pounds each. A further increase of remuneration was conceded in 1838; but this did not satisfy Dickens, who in February 1839 refused to continue the editorship of *Bentley's Miscellany*. However, after much discussion and correspondence, new agreements were entered into—one for *Oliver Twist* and the *Miscellany*, and a second for *Barnaby Rudge*, for which Bentley now consented to pay four thousand pounds, a large and liberal advance, as all must acknowledge, on the five hundred pounds originally agreed upon for the work. Dickens stipulated that he would complete *Barnaby Rudge* by the end of the year 1839, and this point proved to be a *casus belli*. For Dickens soon found the simultaneous composition of two long novels, combined with the editing of the *Miscellany*, an intolerable strain, and, to quote his words to Forster, he said: 'I cannot—cannot and will not—distress myself by beginning this tale until I have had time to breathe. . . . There—for six months *Barnaby Rudge* stands over.' So when Bentley announced, in December 1839, the forthcoming work, *Barnaby Rudge*, he received a lawyer's letter stating that Dickens would not be ready for three or four months. Perhaps Bentley would have consented to the desired postponement had not an announcement appeared that Dickens was about to publish another work, *Master Humphrey's Clock*, elsewhere. This Bentley regarded as an aggravated violation of his own agreement, and resulted in the final separation of publisher and author. Dickens repurchased the copyright and existing stock of *Oliver Twist* for two thousand two hundred and fifty pounds, the existing agreement for *Barnaby Rudge* was cancelled, and the editorship of *Bentley's Miscellany* passed from Dickens to Ainsworth.

The rumour soon spread in London and in literary circles that it was the influence and advice of Forster which had caused Dickens to break his agreement with Bentley; but Dickens, in a long and very interesting letter to Ainsworth, warmly repudiated the charge. This letter, printed *in extenso* in the present writer's *William Harrison Ainsworth and his Friends*, would certainly seem to exonerate Forster from the charge in question. As a matter of fact, it was against his strongly expressed advice that Ainsworth afterwards took over the editorship of *Bentley's Miscellany* just resigned by Dickens. This point is conclusively established by a still existing letter from Forster to Ainsworth.

Before dismissing the limitations in Forster's otherwise great biography, one may perhaps express a personal regret that the biographer devotes but a few words to the social or convivial phase of Dickens in these first glorious years of youth and fame. He barely mentions the frequent rides through the lovely country then surrounding the suburbs of London, which Dickens delighted to take in company with his two intimates, Forster and Ainsworth; and the even more frequent dinings and festivities the trio enjoyed go almost unrecorded. Certainly the dinner in celebration of the completion of *Pickwick*—when the *pièce de résistance* was a glittering temple of confectionery, beneath the canopy of which stood a little figure of Mr Pickwick, gaiters and all complete—deserved one word for pleasant memory's sake.

Forster's all too brief allusion to Dickens's two early visits to Manchester with his friends is a distinct biographical lapse, for these visits were intimately concerned with *Nicholas Nickleby*.

It was in November 1838 that Dickens and Forster first went to Manchester, and they were accompanied by young Hablot Browne, who had just become famous through the illustrations he had furnished for *Pickwick* and *Nickleby*. The party were furnished by Ainsworth with letters of introduction to the most prominent literary men of his native city, and in one of these letters (to Crossley) he observed: 'Dickens's object is to see the interior of a cotton-mill—I fancy with reference to some of his publications. . . . I rather suspect that he is reconnoitring for character, and perhaps you may aid his researches; but at all events you can help him to the best glass of wine in Manchester, and that will materially assist his judgment in coming to a favourable conclusion of the habits of my townsmen.' As a matter of fact, one of the express objects of Dickens's visit was to see two quaint but benevolent merchants of Manchester, William and Daniel Grant, whose qualities had often been described to him by Ainsworth. Another Manchester friend of Ainsworth's, Gilbert Winter, arranged the desired meeting, and it was at a dinner at his residence, Stocks House, on Cheetham Hill, that Dickens and the Grants met. The result was that the Grants in due course made their appearance as the Cheeryble Brothers in *Nicholas Nickleby*. No doubt Phiz's sketches of the Brothers were also drawn, *sub rosa*, from the originals. Dr James Bower Harrison, who met Boz in Manchester, noted: 'Mr Dickens was then writing *Nicholas Nickleby*, and I well remember his reading the proofs of his novel, and smiling at his own writings. He was then a smart-looking young man of rather effeminate appearance, wearing long hair, very much like the pictures of the hero of his story. . . . I still call to mind his polished boots and drawing-room-like attire.'

Dickens, Forster, and Phiz devoted one of their three days in Manchester to an expedition to Cheadle Hall, in Cheshire, to see the three little daughters of Ainsworth, who were at a boarding-school there. The respective parties had not hitherto met, and so by way of a peace

oblation the three young men, all in their 'twenties,' took various books to present to the three maidens, whose ages ranged from eight to eleven. The youngest lady had been intentionally misinformed by a mischievous fellow-pupil that the 'severe-looking gentleman'—Forster—was the dentist on business intent. Consequently when he stepped forward the little girl uttered an exceeding bitter cry, and it was some time before she could be induced to believe that Forster's intentions were friendly, and that, though he might be a man from the *Examiner*, he was not an examiner of teeth. However, peace was restored, and all spent a very happy time together.

Dickens and Forster were so delighted with their experiences in Manchester that they repeated their visit only two months later, in January 1839, and this time Ainsworth was able to accompany them; the whole party were the guests of his relative, Hugh Beaver, at The Temple, Cheetham Hill, where a large dinner-party was given on the night of their arrival, Saturday, 10th January. On Sunday the trio attended service in the Collegiate Church (now the Cathedral). On Monday a semi-public dinner was given in honour of Dickens and Ainsworth conjointly; on Tuesday they dined with James Crossley, and on Wednesday with Gilbert Winter, when, no doubt, the Grants again came under the ken of Dickens, the party subsequently attending a public assembly.

It will be remembered that Forster, in the biography, merely alludes to all these pleasant days and convivial nights of congenial friendship in one short sentence as regards Ainsworth, and in a brief note of memory concerning Gilbert Winter and Stocks House; yet in the later phases of Dickens's career, when the biographer was the one and all-important friend, there is often a prolixity of detail in the narrative.

Granting, then, that Forster's book has faults both of omission and commission, that it is egotistical and at times prejudiced, that its arrangement is bad and its chronology chaotic, yet, owing to the biographer's whole-hearted admiration and enthusiasm for his subject, and by his sympathetic and vivid presentment of his hero's character and career, the final result is a great biography, the greatest, it is safe to say, of its great subject, and one that will never be superseded. Many reasons support this conclusion. Dickens himself wished Forster to be his biographer; and the novelist's near relatives, those best qualified to judge of its claims and merits, have always given their *cachet* of approval to this particular work. Dickens's most trusted friend and the executrix of his last wishes, Miss Georgina Hogarth, has stated to the present writer: 'Mr Forster was the only person with the material and authority to write the biography. But it was written very soon after Mr Dickens's death, and a great deal could not be said *then* which becomes possible as years go on. I always feel that Mr Forster's book will be more appreciated in years to come than it is now.'

The truth of Miss Hogarth's belief (expressed eight years ago) is already becoming justified as the Dickens centenary approaches. The successful consummation of this sumptuous Memorial Edition of the *Life of Charles Dickens* demonstrates the fact. Its most attractive feature, of course, is the unique collection of over five hundred illustrations, gathered together and arranged by Mr B. W. Matz. Of particular value are the views of the houses and schools associated with the youth of Dickens, for the scenes and surroundings where early and lasting impressions were formed must ever be of supreme biographical importance. Great interest will attach to the portraits reproduced in this edition, notably of Dickens himself, his parents, his wife (who is presented in an exquisitely graceful sketch by Maclise), and children; and to the pictures of family life at Gadshill. Though superior critics may vainly assert that the public has no concern with the private life of a great man, but only with his life's work or contribution to art, the inexorable fact remains that humanity is most interested in the human or domestic side of a genius. A book on Nelson and Lady Hamilton will find twenty readers where a work on Nelson and Trafalgar will find but one, Byron's love-affairs are more discussed in these days than his poems, and Napoleon's wives threaten to overshadow Waterloo.

It is to be regretted that Mr Matz has not included in his great collection portraits of Macrone and Bentley, and a view of Kensal Lodge, where, as previously stated, Dickens and Forster first met; and that he has left Dickens's visits to Manchester in 1838 and 1839 unillustrated, giving no views of Stocks House and The Temple, or portraits of the Grants, Gilbert Winter, and James Crossley. But the compiler may well say that, as these incidents or people are only noted by a few words in Forster's text, the omissions are justified; nevertheless, as this paper has endeavoured to show, they were either important or interesting factors in the life of Dickens. In other respects Mr Matz's collection is complete and truly admirable, and both he and the publishers are to be congratulated sincerely on their worthy tribute to the great novelist whose centenary is at hand.

THE CAHUSAC MYSTERY.

CHAPTER X.—IDEALS.

THE cutting from the *Gas-Lamp* consisted of a few venomous sentences embedded in masses of verbiage. M. de Sarsan knew his world; and, though *L'Œil* now represented a faction with which he no longer openly identified himself, he still held the controlling strings in his hand. Before the world he was officially connected with another newspaper. But *L'Œil* continued to offer him a safe outlet for damaging onslaughts on foes—or friends.

The *Gas-Lamp's* attention had been cleverly directed to the pamphlet—from the point of view obtaining on this side of the Channel one could not describe *L'Œil* as a newspaper—the moment being opportune, for the substance of its articles just then was being neatly medicated to appeal to the British palate, and the *Gas-Lamp* was tempted to give translations of the lurid 'historiettes,' the calumnies, the unsavoury personal items; and, finding that scurrility gained favour in certain quarters, it continued to serve up these vitiated gleanings as a weekly dish. From this period, one is obliged to add—not without shame—its circulation went up by leaps and bounds.

The point of importance to Cahusac in the article given him by Lady Madesson was embodied in a few paragraphs. It was asserted that the flagrant hypocrisy of certain Powers was nowhere more monstrously apparent than in the pretended purity of their diplomatic methods. As an instance of the accuracy of this statement, *L'Œil* implored its countrymen to recall the case of a rising young diplomat who had—it might at this distance of time be admitted—been the secret friend of a country not his own, and whose untimely murder in the streets of London had for some twenty years remained a mystery. *L'Œil*, however, was now in a position to prove that he had been assassinated. Why had this young man lost his life? Who had most to gain by his removal? It was hardly necessary to answer such a question. Farther on there was a reminder that the son of the diplomat had elected to follow his father's profession. At this point the subject was dropped.

Next morning Malcolm Cahusac visited Detching at his chambers, and, with a word or two of explanation, gave him the long slip of paper. Detching unfolded it and read it slowly to the end. With each line his face grew harder and more set. At length he laid it across his knee and smoked on for some moments, then raised the slip and read parts of it again.

Meanwhile Cahusac sat opposite, stern and brooding.

'I say,' Detching said abruptly, breaking silence, 'are you in love?'

Cahusac had been rapt in thought, but the question must have touched his reverie at some point. He looked up, and the loneliness of the man leaped suddenly into his eyes. 'I think I should be if—if it were not for that, or the chance of such as that, coming up against me at any time'—his glance fell on the paper slips—'who knows?'

'How did you hear of the business?'

'From Lady Madesson last night.'

Detching sat up with a jerk. 'She would fight your battle for you! A woman whom a man could adore!'

'Perfectly. A woman whom many men have adored.'

Detching seldom used bad language. He considered it to be a waste of energy below the dignity of a reasoning creature; but he said something now that sounded double-shotted. 'There's a queer vein of Puritanism somewhere in the bed-rock of your character,' he went on cynically. 'Don't let it influence you against facts.'

Cahusac shook his head. 'You're wrong there, old man. My Puritanism, if I have any, is a thin veneer; and'—he hesitated—'Lady Madesson happens to know it.'

'Ah!' Detching's red-bearded face scowled contemptuously across the fireplace. 'And yet?'

'And yet she is not the ideal woman.'

'Hang ideals! She has touched you. You acknowledge it. And she's just the woman you want. Besides, it's not to be denied that she is perhaps the most beautiful woman in London, too, which is saying a good deal. You are blind, Malcolm! I wish I had half your chance.'

'Yes, I suppose she is the most beautiful woman I've ever seen. As for my chance, if I had any, you're welcome to it.'

'I'd say "Thanks" if it were yours to give, but unluckily it isn't. Seriously speaking, you've a dangerous and difficult game to play, and you'll want money. Besides, she's got a head worth two of ours. I tell you, taking you all round, I don't know a fellow who wants a wife worse than you do. Keeping all this worry to yourself will turn you sour if you don't look to it.'

'What does it matter?' Cahusac's irritability was new. 'Could I ask any woman to bind herself to me with all that behind me?'

'Why not?'

'Come now, would you allow your sister to marry a man whose father had been accused more or less plainly of betraying his country in this foul way? Would you allow her to marry a man whose own career must be definitely

checked, if not ruined, by the reaction of such rumours? If I could take steps—if I could have these papers up for libel, for instance—it might be a different matter. But you know how I stand. You know that I am powerless, that I can prove nothing, and may never be able to clear up the unhappy business unless chance befriends me and I can get my hand upon the man; but beyond the fact that it was he who stole the letters I have no clue.'

The harshness of Cahusac's voice was new to his friend, who pondered for a minute.

'What you say might apply to the Lanceley girl,' he said roughly, 'because of her relations, who think they run the British Empire upon lines made from their own family tree. But the other—why not?'

'Why not? Because there sits in Paris to-night a man who is wrecking me with pen and paper. After a long silence I have reached a fresh development in the plot. These articles in *L'Œil* emanate from some obscure source in Paris. I must find out that source, and put a stop to the paragraphs, if I can. I cross to-night.'

Detching stretched himself. 'All right,' he said. 'Let us go.'

'Not you! Why should I drag you over?'

'Because you are a fool, and would swamp without me.'

Cahusac laughed with some relief. The tension of the earlier part of the conversation was relieved.

'Besides,' went on Detching, 'I know a man called Huson who is Paris correspondent to a couple of big English and American dailies. He ought to be able to give us a lead.'

Cahusac made no answer for a moment or two. His face was rigid with some disagreeable, baffling thought. Detching saw the quiet eyes lower to fierceness. After the long waiting, Cahusac looked as if he had found his enemy.

'It is well that he has held himself in reserve,' thought Detching, 'for, now that the time has perhaps arrived to strike, he has the strength to strike home.' Then he added aloud, 'By the way, how comes Lady Madesson to be mixed up in this?'

'Only a woman's curiosity,' replied Cahusac. 'She scented a mystery, and began to put two and two together. She appears to have made it her business to find out all she could from every one who would talk about it. And a good many people have been doing that latterly, as you know,' he ended, with some bitterness.

'And I bet you she has come to some sort of conclusion. Why, man, speak out; what is it?'

'Yes, you 're right; she has an idea.' Cahusac smiled rather incredulously. 'She says De Sarsan put her closer on the track than anybody. To use her own words, "No person could know so much unless he were a close friend or an enemy."'

'Quite so. Go on.'

'Well, he is not my friend, and she insists she has reason to think that he is my enemy.'

'You have reason to think the same,' said Detching, eying his companion askance.

'I suppose so. He might have something to do with these newspaper attacks.'

'More than possible. Go on.'

'He has always been suspected of being a secret agency man. He was in London at that time. He told me himself that he was acquainted with my step-mother—you heard him last evening. In short, Lady Madesson believes him to be the originator of these paragraphs.'

'Of course! What a woman!' almost groaned Detching. 'Ideals! Hang it all, man, what are ideals to a reality like that? Handsome, level-headed, and clever, with love enough and money enough'——

'To make the man who wants her egregiously happy. That 's true,' Cahusac said, impatiently turning off the other's meaning. 'Let it rest for the present.'

'All the same, she may be the woman to save you, in spite of yourself. Now, I have a trifling detail to mention to you, which gives me the idea that Lady Madesson has made the most extraordinary guess at something near the truth. Do you recollect my telling you of a foreigner I met when going down Park Lane on that memorable evening? He stood lighting a cigar under a lamp-post. I could not see his face, for he wore a soft hat pulled over his eyes; but I saw his right hand, which held a match, very clearly. I noticed that he had a curious malformation of the little finger; the nail was singularly long, and half the width of an ordinary nail. If I had not been a doctor I don't suppose I should have remarked it.'

'Well?'

'I saw that nail again at Mrs Westaway's last night, and the hand that carried it attracted my eye because it twitched when you inquired if De Sarsan remembered the house.'

'Look here, Detching, you don't mean that De Sarsan—— Why have you not told me this before?' Cahusac's voice was low and strained, and a vein suddenly stood out upon his forehead.

'For the very excellent reason that never before have I had the pleasure of meeting De Sarsan.'

'Good heavens! Then the chances are that De Sarsan *is* the man! At any rate, he is probably the only soul alive who knows the whole truth about that last night at Park Lane, for whoever stole the letters must have been the man who was bound to get hold of them for his own sake—at any cost. So he ventured far.'

'Give him rope enough,' said Detching after a

moment's silence, 'and he must inevitably betray his knowledge.'

'No, that must never be permitted.'

'It would fix his identity.'

'Yes; but at what a cost! I am not prepared to pay it, Detching. Lady Cahusac's story must never be known. Well, we must cross to-night. Once I get hold of his agents I can lay my hand upon him and bring pressure to bear.'

Detching looked round as if mentally picking out the articles he meant to take with him on his journey, and asked half-abstractedly, 'De Sarsan has hated you all these years; why should he just at this time change his tactics of silence?'

A slow flush crept up under Cahusac's skin. 'He wishes to ruin me, that is all.'

'Now, why at this particular time? You have not been interfering with his little games, have you?'

'Apparently I have,' Cahusac answered shortly.

'In what way? I'm not particularly curious, don't you know; but I must have this straight if I am to be of use.'

'It will not, I hope, be necessary for you to do anything but introduce me to Huson.'

'No, I hope not. Yet it seems to me we can't be sure we are booking a bee-line passage to the end we're endeavouring to arrive at. And knowledge may be useful—even to me, who only want to look on, I assure you, if the thing goes propitiously.'

'If you wish to press the question, then, I have reason to believe that De Sarsan has dared to think of Miss Lanceley as a—a wife.'

'He is rather oldish for her, to be sure. Yet'——

Cahusac said nothing.

Detching ventured to whistle softly. It is not to be supposed that he had gathered no hint of the subject presented to him in so disjointed a manner by Cahusac, but he chose to make it appear so.

'Malcolm,' he began, with the air of one trying to face a preposterous notion with some show of tolerance, 'you do not mean to tell me that you—*you* have for an instant thought of the same lady in the same light?'

'Had it been possible for me to think of any one in that light I might have done so; but—— I need not repeat myself.'

'Oh Lord!'

Cahusac turned on him hotly. 'What do you mean, Detching?'

'Eh? Nothing.'

'Alice Lanceley is pure and sweet and good. We can't say as much for—for every woman.'

'And strong?' questioned Detching. 'We can't say that either for every woman.'

Cahusac laughed angrily. 'It strikes me that Lady Madesson has made one man appreciate her.'

'That's enough, Malcolm! I can't help your being a fool, but I can help your talking about it. One thing at least you will do. You will go to see Lady Madesson before we start?'

'No,' obstinately.

'No? Though she may have valuable hints—even information—to give you?'

'I hope we'll be able to do without either.'

'No man can ever do as well without a woman's help when that woman happens to be such as Lady Madesson. You're off? Well, we'll meet to-night at Charing Cross.'

Cahusac got as far as the door, and stopped. 'I'm going to Park Lane to Mrs Westaway's,' he said in an odd, defiant voice. 'I may never see Alice again, in the same circumstances. I've denied myself many good things during the course of my life. I'm hanged if I deny myself this one!'

'What in the name of reason are you going to—say—to do?'

'Nothing! That is the irony of the situation.'

He was gone, and Detching stood in the centre of the room, still staring at the closed door.

(To be continued.)

DERELICT SHIPS.

By WILLIAM ALLINGHAM, Author of *A Manual of Marine Meteorology*, &c.

EVERY storm that travels over the waters which divide, yet unite, the New World and the Old leaves in its wake some sailing-ship abandoned by her crew. As a rule these dreaded derelicts are of wooden build and laden with cargoes of lumber. Often they have carried costly cargoes under every sky with credit to themselves and profit to their owners, but the increasing infirmities of age have caused them to engage in the lowliest forms of ocean-carrying. Under the adverse influence of a careering cyclone these gallant craft meet their fate. The savage sea opens wide their straining seams; the pumps, clatter as they may, are quite unable to cope with the ingress of sea-water; and the disheartened crews seek safety in a passing ship at the first opportunity. Thus it happens that many a lumber-laden sailing-ship drifts deviously at the will of wind and current, a menace to safe navigation, until her hull is riven into fragments by the combined forces of Æolus and Neptune, or reaches land after a solitary drift of many weary leagues of sea.

Quite naturally, the North Atlantic holds the record for drifting derelicts, inasmuch as it is the great ocean highway of the nations. During

the five years 1887 to 1891 not fewer than nine hundred and fifty-seven derelict ships were reported to the then Hydrographer at Washington, Captain (now Admiral) Richardson Clover, U.S. Navy, as in evidence between the fifty-second meridian of west longitude and the east coast of North America. Of this large number three hundred and thirty-two were identified by name, and the remainder were either capsized or battered out of recognition. On an average there were about twenty derelicts drifting in the North Atlantic at any instant, and the life of each was one month. The Washington Hydrographic Office receives reports from shipmasters under every flag, setting forth the appearance and the geographical position of every derelict sighted during the passage across; and this information is published in the weekly Hydrographic Bulletins and the monthly Pilot Charts, which are freely distributed among navigators visiting American ports by the branch offices of that department of the United States Navy. The British Board of Trade also furnishes shipmasters in United Kingdom ports with similar printed information, and the British Meteorological Office and the Deutsche Seewarte have followed suit by graphic representation on their monthly Pilot Charts of the North Atlantic.

Many derelicts disappear within a few days of abandonment, but some drift several thousands of miles before the end comes. A vessel left to her fate near New York, for example, may drift southward with the Labrador current until not far from Cape Hatteras. Thence she finds a way into the relatively warm water of the Gulf Stream, and may eventually drift ashore on the west coast of Europe. Should the derelict happen to get into the Sargasso Sea, an area in mid-Atlantic of light winds and variable currents, made memorable by the pen of Julius Chambers, she will probably travel in a circle for a long series of days.

An Italian barque, the *Vincenzo Perrotta*, abandoned 600 miles north-east of Bermuda in September 1887, came ashore at Watling Island in April 1889, after covering no less than 3000 miles in 536 days. The Norwegian barque *Telemach*, abandoned 450 miles west of the Azores in October 1887, seems to have broken up when 600 miles nearer the American coast, after a drift of 3150 miles, occupying 550 days. An American schooner, the *Wyer G. Sargent*, left with a valuable cargo of mahogany in March 1891, near stormy Cape Hatteras, was last sighted in mid-Atlantic, having drifted 5500 miles in 615 days. Her track, as laid down on successive United States Hydrographic Office Pilot Charts from numerous reports at varying intervals, is a veritable maze. A similar vessel, the *Fannie E. Wolston*, apparently holds the record for a long drift in solitary state. Abandoned not far from Hatteras in October 1891, she was last seen close to her initial position in October 1894. During this three years' interval she travelled about 10,000 miles in diverse directions. The schooner *W. L. White*, abandoned during the blizzard of March 1888 just eastward of the Delaware Capes, made tracks for the Banks of Newfoundland; there she remained for many days, right on the route of palatial passenger-liners; then she got another slant to the north-east, and eventually drove ashore at Haskeir Island, one of the Hebrides, after traversing 6800 miles in 310 days. Her timber cargo was salved by the islanders in fairly good condition.

The schooner *Twenty-One Friends*, abandoned off the entrance to Chesapeake Bay in March 1885, was last heard of within 100 miles of Cape Finisterre. She had crossed the Atlantic in 260 days, and covered some 3500 miles. Two similar vessels, the *Ethel M. Davis* and the *David W. Hunt*, were left by their crews within a few hours during a cyclonic storm which played havoc along the Atlantic coast of the United States in November 1888. The former gave up the struggle when 800 miles from Cape Finisterre, after drifting 4400 miles in 395 days; and the latter was last seen near Madeira, having covered 5000 miles in 350 days and been reported forty-one times to the United States Hydrographic Office.

Metal ships are seldom left derelict; but there are not wanting remarkable verified drifts even of this class. In October 1876 the British iron barque *Ada Iredale* was abandoned, with her coal cargo burning fiercely, when 2000 miles east of the Marquesas Islands, South Pacific. She moved slowly westward with the south equatorial current, travelled 2500 miles in 241 days, and was then picked up by a French warship, which towed her to Tahiti. After the fire had died out the hull was repaired; she was fitted with new masts and rigging, and has ever since been known as the *Annie Johnson*, of San Francisco, California. On her being boarded some time ago she was still doing well, and quite a handsome vessel. The British ship *Oriflamme*, another iron vessel, was left under similar conditions about 850 miles west of Lima, Peru, in June 1881. She drifted ashore on the island of Raroia 241 days later, unfit for repairs, and had travelled 2850 miles in that interval. In December 1892 the big four-masted British ship *Honresfeld* was abandoned, also with coal cargo on fire, when in 8 deg. N., 118 deg. W. A week later she was sighted; but nothing more was heard of her for just three years, when the American whaler *Alice Knowles* reported having passed the derelict in 9 deg. N., 175 deg. E. Her ultimate fate is unknown. In April 1882 a similar vessel, the *Falls of Afton*, was precipitately abandoned while on the way from Glasgow to Calcutta with a valuable cargo. A few days later she was picked up by a French vessel and taken to Madeira. Since that time

she has had many successful voyages; but the then master suffered severely under the finding of a court of inquiry. In May 1902, while bound from Australia to California, the metal ship *Fannie Kerr* was left, with her coal cargo on fire, in 20 deg. N., 169 deg. W. Nearly twelve months later, near Formosa, the derelict was boarded by the chief officer of the steamship *Volute*, who took away her bell, which was in good order. Two days subsequently she stranded on Formosa! Five hundred tons of her coal cargo was then untouched by fire, and portions of her saloon were still in good condition.

Ships which have been abandoned more than once in their career are not unknown. In November 1888 the iron ship *Duncow* stranded close to Dunkirk Harbour during heavy weather. The crew sought safety on shore, and the ship afterwards floated. Belgian fishermen boarded the derelict, obtained the services of a tug, and took her to Terneuzen, thus assuring for themselves salvage payment, which could not have been legally claimed had she reached a French port. In 1897 this vessel, while carrying timber from Puget Sound to Australia, went ashore not far from her destination. She again floated off after abandonment; and once again a tugboat earned salvage by bringing the derelict into port uninjured. In October 1905 the Swedish wooden barque *Orion*, salt laden, was picked up by the steamship *Exeter City*, and brought to Halifax, N.S. Her chronometer, charts, ship's papers, a fine library, and seamen's effects were all on board, together with a sufficiency of food. Later on it was discovered that the crew had previously been taken off the *Orion* by the steamship *Etruria*. She was placed under the British flag, converted into a barkantine, renamed the *Marion C.*, and resumed sailing. Towards the close of 1906, however, this vessel was again abandoned; and the U.S. ship *Lebanon*, which had been sent out to search for this dangerous derelict, ended her existence, by the aid of torpedoes, about 300 miles east of Sandy Hook, the entrance to New York harbour.

In 1895 the German liner *Normannia* effected a daring rescue in the Atlantic by taking off all hands from the iron sailing-ship *Arno*, then on her beam-ends, with grain cargo shifted, and within an ace of capsizal. Shortly afterwards the steamer *Merrimac* fell in with this derelict, put a prize crew on board, and trimmed her upright, and she managed to reach Liverpool after an exciting passage. In 1898 the steamship *Samaria*, when some 400 miles south-west of Queenstown, sighted the derelict German iron sailing-ship *Schiffswerft*, with only her mizzen lower mast standing. The steamer's chief officer and a boat's crew volunteered to steer the derelict after she was taken in tow, and at one time the angel of death fluttered his wings immediately over the salvors. A howling hurricane prevailed, a boat could not be sent to take them off the derelict, and a watery death was imminent. The weather improved, however; and the *Schiffswerft* was eventually brought to Queenstown without further mishap. In 1899 the barkantine *Anna Alwina*, of Riga, fell in with the derelict Norwegian iron barque *Ellen* about 1500 miles south-west of Scilly. The lame duck was on her beam-ends, her cargo of beans having shifted; but the salvors succeeded in trimming her upright, and, aided by fine weather, brought their prize safely to England. In 1900 the British ship *Senator* observed the Norwegian iron ship *Superb* drifting aimlessly about, some 2000 miles west of Gibraltar. A volunteer prize crew of an officer and five men were put on board the derelict, and they brought her to Gibraltar. The salvors were awarded nearly two thousand two hundred pounds for services rendered, and four hundred pounds for extra expenses incurred in the salvage.

Rather amusing incidents crop up occasionally with respect to derelict ships. The German steamer *Fürst Bismarck* collided with the French sailer *Louise*. At once the crew of the latter clamoured to be taken off what they deemed to be a sinking ship, and were accommodated. Thereupon an officer and some sailors from the steamer offered to sail the derelict into the nearest port or perish in the attempt. The volunteers were successful, and received two thousand marks for salvage services rendered. In 1897 the Portuguese barque *Para*, with a cargo of lumber from Pensacola for Trouville, was abandoned by her crew near Scilly. They took refuge on board the British steamer *Bourbon*, which promptly put a volunteer crew on board; and they brought her safely to Falmouth. Not long since the iron steamer *Tyr* was abandoned in a sinking condition in the North Sea. A fishing-vessel collided with the derelict, on board of which the crew leaped, only to discover that they had not gained by this compulsory exchange. Forthwith they launched one of the sinking steamer's boats, which had been left behind by her original crew, and were eventually rescued by a passing vessel. In 1844 the sailing-ship *John Blake* was abandoned by her crew on the coast of Cuba. While making for the nearest land in the boats the shipwrecked men sighted another derelict, the *Two Friends*, stranded on a shelving beach. They succeeded in getting her afloat, sailed her to England, and were awarded a goodly sum for salvage remuneration.

Derelict ships add to the difficulties of transatlantic navigation; hence the demand of the shipping industry for specially constructed derelict-destroyers, such as the American *Seneca*, to patrol the Atlantic, experience having shown that a derelict is not nearly so impossible to locate as is sometimes alleged. The barque *Siddartha* was abandoned near the Azores in February 1899. She drifted slowly to the

north-east, until within 400 miles of Queenstown, and there she hovered over the liner tracks for several successive weeks. Moved by a joint appeal of the White Star and Cunard Companies, the British Admiralty sent out two warships in quest of the derelict, and she was soon anchored in Bantry Bay. This vessel, while derelict, was reported to the United States Hydrographic Office by more than sixty ships. In February 1895 the barque *Birgitte* was abandoned on the western side of the Atlantic; and on 1st March she was sighted about 1000 miles west of Cape Clear. Drifting slowly eastward, almost continuously on the routes followed by the large transatlantic liners, this derelict was found by a tugboat and towed into Queenstown. Forty-three vessels had reported her to Washington during the interval. At night-time and in thick weather such dangers may be passed quite close without any one having an inkling of their proximity. About the same date, but more to the north-east, the Russian barque *Louise* was abandoned. She apparently went north as far as the Faroe Islands, under the influence of the Gulf Stream extension; thence proceeded eastward; and was picked up by two steam-trawlers when 16 miles from Aalesund, Norway, and thence towed into that port, after a drift of approximately 1400 miles. The American schooner *Alma Cumming* was left to her fate in February 1895 off Chesapeake Bay. After the end of May, nothing was heard of her until March 1896, when she was about 800 miles off the Cape Verde Islands. She was then totally dismasted, had evidently been unsuccessfully set on fire by some passing ship, and her deck was level with the sea-surface. In August she was observed ashore on an island off the San Blas coast, Isthmus of Panamá, with the natives busily engaged annexing all they could from the wreck. On 1st March 1911, in 53 deg. N., 28 deg. W., the Russian steamer *Korea* was abandoned by her crew; and two days later, about a degree farther east, the steamer *Ionian* sustained considerable damage by collision with the derelict.

Some of the reports of alleged derelict ships are as thrilling as a nautical novel. In May 1823 the *Integrity* fell in with a derelict close to Jamaica, the decks and hull of which were showing a rich crop of barnacles. Her cabin was full of water; but a trunk was fished up which contained coins, rings, and watches. This salvage realised three thousand pounds. In August 1872 the schooner *Lancaster* sighted a dismasted derelict, the *Glenalvon*, on board of which several skeletons of men were discovered, but not a morsel of food. An open Bible, it is reported, lay face downward on the cabin table alongside a loaded revolver and a bottle containing a piece of paper, on which was written: 'Jesus, guide this to some helper! Merciful God, don't let us perish!' All the bodies were reverently committed to the deep, and the derelict left to whatever the future had in store for her.

In 1882 the Nova Scotia barque *L. E. Cann* was towed into a United States port by a steamship which had found her adrift. Later on, in dry-dock, fifteen auger-holes were located in her hull below the water-line. They had all been bored from the inside, and subsequent inquiry revealed the fact that her former captain had conspired with a resident of Vera Cruz to load the vessel with a bogus cargo, insure it heavily, scuttle her when in a suitable position at sea, and divide the insurance money. Unfortunately for these partners in crime, the barque did not lend herself to their nefarious operations nearly so much as was expected.

In 1894 the Austrian barque *Vila*, carrying a cargo of bones which were said to have been gathered from the battlefields of Egypt, was found derelict by a Norwegian steamer and towed into New York. Not a word has ever been heard as to the fate of this vessel's crew. Presumably they took to the boats for some reason, and disappeared without leaving a trace. About the same time the sailing-vessel *C. E. Morrison* was fallen in with, drifting derelict, and set on fire. The crew of the destroyer first salved a bank-book, a sextant, fifty charts, and some pictures, all of which were eventually returned to their rightful owner, Captain Hawes, who had been compelled to leave his vessel without standing on the order of his going. In 1895 the derelict and burning barkantine *Celestina*, bound from Swansea to the Strait of Magellan, was boarded by a boat's crew of the barque *Annie Maud*. A written message was found on the cabin table stating that she had been abandoned in open boats. The fire having been partially subdued, sail was made on the prize, and volunteers navigated her to Rio de Janeiro.

The *Marie Celeste* is a mystery of the sea. This brig left America for Gibraltar; and nothing more was heard of her until she was sighted approaching the Strait in a suspicious manner, when she was found to be derelict. Her hull was sound, there was no sign of an accident aloft, and her boats were in their appointed places. Some remains of a meal on the cabin table were still fresh, and a watch was ticking unconcernedly; yet her captain and his wife and daughter, together with the crew, had disappeared for ever.

Many who gaze upon the obelisk, known as Cleopatra's Needle, erected near the House of Commons, on the Thames Embankment, are perhaps unaware that it was for some days in the hold of a derelict ship drifting about the Bay of Biscay. The salving vessel lost a whole boat's crew in the first attempt at recovery.

Nautical novelists have made moving word-pictures of drifting derelicts, and hoaxers have also utilised them. In 1893 some witty person

closely copied parts of a soul-stirring yarn by Clark Russell, and the alleged modern experience was telegraphed round the world, appeared in the press, and was then decisively contradicted. It was asserted that the Norwegian ship *Elsa Anderson* arrived at Galveston with an English-built brig in tow, which had apparently been burnt and sunk more than half a century previously. A submarine seismic disturbance was invented to account for the vessel's return to the surface. The hull was covered with strange sea-shells, and in the hold were chests containing many guineas bearing the date 1800, several watches, and a stomacher of pearls! One of three skeletons was said to be that of a man over seven feet in height. This hoax was successful until it reached Galveston. Then the authorities denied that the story had the slightest foundation in fact. Six years later a similar hoax was perpetrated, which ought immediately to have been recognised as merely a variant of *The Frozen Pirate* by the above-mentioned eminent nautical novelist. It was gravely asserted that the barque *Silicon*, on her way from the United States to Greenland, had picked up an old-fashioned derelict ship near the Greenland coast. When access to the hold was gained, the salvors, so ran the hoax, discovered that she was laden with furs in good condition; and her log-book showed that she had been abandoned by her crew in 1848. Like the ship imagined by Clark Russell, she was said to have been fast in the ice in the far north. One of the most ridiculous derelict-ship hoaxes of the past century had quite a boom in 1896. A burning derelict, read an astonished world, had been passed between the Cape of Good Hope and Australia, with her lower holds full of coal and petroleum, and the between-decks portion crammed with the dead bodies of people who had met their fate by suffocation while on their way from Russia to Brazil. The burning cargo had generated gas which suffocated the emigrants; the bodies had swollen out of human shape, and subsequent explosions had torn many limb from limb! This tissue of falsehoods appeared in many of the world's daily papers without comment.

H.M.S. *Resolute*, since broken up, was one of the most famous of derelicts. She was abandoned in 77 deg. 40 min. N., 101 deg. 20 min. W., drifted southward in the centre of a solid sheet of ice, and was eventually picked up by an American whale-ship off Cape Mercy, in 65 deg. N. After having been refitted by the United States Government, she was presented to England with impressive ceremony. A desk of the President of the United States, in the White House, Washington, D.C., was made from the timbers of the *Resolute*, and sent by Her Majesty Queen Victoria in memory of that courtesy and loving-kindness of America to England. It is a substantial token of the goodwill existing between two kindred peoples.

Sufficient has been written to indicate that derelict ships often live long and travel far, are dangers not lightly to be despised, and are occasionally salved. Some of the large shipping firms of the United Kingdom keep their commanders informed by telegram with respect to derelicts on the transatlantic routes; the shipping papers of London and Liverpool publish tabular statements regularly of similar import; the United States Hydrographic Office, the British Board of Trade, the British Meteorological Office, and similar bodies on the Continent supply navigators with the most recent information respecting such drifting dangers. Thus life and property were never so safe at sea as they are to-day.

THE ENVOY OF ST JAGO.

By GEORGE ELLBAR.

CHAPTER I.

THE youngest, and according to the illustrated papers the handsomest, captain in the British Navy List took the slate from its slightly excited bearer and read the wireless message with a lifting of his eyebrows. Then he handed it in silence to the commander.

'Good Lord!' blurted out that officer. 'I thought the diplomatic gentlemen had squared things up.'

'Some hitch, I suppose,' said Captain the Honourable Fitzroy Peele thoughtfully. 'I wonder'—he shrugged his broad shoulders—'but what's the use of wondering? That's clear enough. What?'

'Yes, that's clear enough,' agreed Commander Pawson. 'Anyway, it'll give us a bit of gunnery practice, sir.'

Captain Peele was looking at his watch. 'It's now five o'clock,' he said briskly. 'My orders are to open fire at sunset—just two hours. Make the signal "clear for action" at once, Mr Pawson, and carry on.'

'Very good, sir.'

Through the square light on the port side of the *Invulnerable's* state-room the city of St Jago was framed as in a picture. From the intense blue of the Pacific the stone quays and lime-washed houses rose white and peaceful against the unclouded blue of the sky. Here and there a church, or a public building, or a mass of dark-

green foliage gave relief to the scene; while high in the centre of the city stood the dazzling square tower of the governor's house, with its flagstaff and wireless mast.

Peele, rising from his desk, came suddenly upon this fairy-like scene, and was seized with compunction. Around him, throughout the ship, was the sound of hurrying feet, the rattling of stanchions being lowered, the lumbering of heavy weights, and all the bustle and noise of preparing for action. It seemed almost wanton cruelty that the object of these preparations should be the destruction of that fair town. He gazed for a moment at the seemingly unconscious city, and cursed mentally the foolishness of the rulers who had brought the little republic to such a pass, and the ineptitude of the negotiators who had failed so lamentably to lead her out. For Captain the Honourable Fitzroy Peele, R.N., was a man of sentiment.

Then he shook himself irritably, and was the naval officer again, knowing his orders, and intent only on carrying them out to the best of his ability.

He made his way along the main-deck, a trim, well-knit figure, cool, clean-shaven, keen-eyed. Men jostled past him at the double as if he were a mere civilian instead of master of their destinies and those of two other ships' crews as well. They were doing his business, and it was his business to keep out of their way while it was done.

On the upper deck the turrets of the great twelve-inch guns were being turned, and a party of men under the boatswain was busy filling the ship's boats with water. Peele went up on the bridge, where he found the commander bending over the telephone.

'Some hitch in the fire-control of B turret, sir,' explained the latter, looking up.—'Ah, yes, yes, I 'm here. All right, you say? Good. Good-bye.' He hung up the receiver.

A signalman came up and saluted. 'Launch flyin' flag of St Jago comin' off shore, sir.'

Captain Peele and his executive officer moved over to the end of the bridge. A little launch, bravely carrying the flag of the timber-trading republic—a tree with an axe lying at the foot—was ploughing rapidly toward the big cruiser.

'Seems appropriate,' commented the captain, indicating the flag as the launch came alongside. 'I wonder what sort of reply they 've sent to our ultimatum!'

A side-boy doubled up on the bridge and handed Captain Peele a letter. Peele read it and stood silent for a moment, frowning at his thoughts. The commander looked on curiously.

'Show the gentleman to my cabin,' said Captain Peele at length, curtly.

The message was quite brief; it simply conveyed the earnest request of the governor of St Jago that his secretary might be granted an audience. It gave no indication of the nature of the republic's reply. Captain Peele's ultimatum was addressed to the president; and, strictly speaking, he could refuse to meet any one but an accredited representative of the state. Nevertheless, he knew the governor of St Jago to be both powerful and influential, and motives of humanity prompted him to accede to his request.

A figure enveloped in a long military cloak was standing by the port light as the captain opened the cabin door. He observed with astonishment that the stranger was still wearing his sombrero, which was drawn down in such a way that his face was not visible. Peele stepped forward, moved to sudden anger at this exhibition of rudeness.

'Sir,' he said sternly, 'is it the custom of the governor of St Jago's secretary never to remove his hat?'

The other started violently. Then with a sudden movement the sombrero was swept off, the cloak fell away, and Peele found himself face to face with a woman whose flushed face and evident consciousness of her appearance enhanced rather than detracted from her undoubted beauty of face and form. An involuntary exclamation of astonishment came from Peele's lips. Then he recovered his self-possession.

'Madam,' he said, bowing courteously, 'you have the advantage of me. I had expected to see the secretary of the governor of St Jago.'

'And,' replied the girl, 'the governor of St Jago's secretary stands before you. Is it the custom of the captain of His Majesty's ship *Invulnerable* never to offer a seat to a lady?'

Captain Peele bit his lip. With feelings in which annoyance and humorous appreciation of the hit struggled for supremacy, he placed a chair for his surprising visitor.

'May I ask,' he said grimly, 'what is the meaning of this play-acting?'

'Play-acting!' The girl rose, her face white from the intensity of her feelings, and her dark eyes glowing. 'Have I come—as I have come—to plead for the lives of the innocent women and children of St Jago to be sneered at as a play-actor? Do you call it play-acting when hundreds of poor, unoffending people are to be butchered because—because a petty state is too petty to apologise, and a great nation is too great to be magnanimous? Ah, but I forgot. You are English, cold and unyielding, oblivious to everything but enforcing the might and the power of your great nation. It may be play-acting to you just to stamp out a few common foreigners—a mere incident—a little gun-practice. Oh my God!'

Staggered by the violence of this outburst, Peele stood looking dumbly at the girl, who

had subsided into her chair, with her face in her hands, the picture of overwhelming grief. Because the object of her visit touched a responsive chord in his own nature, the bitterness of her speech—an attack rather than an appeal—passed unheeded. He felt almost guilty, and his discomfiture was increased by his Englishman's horror of a scene. Everything else sank into insignificance before the necessity of ending that.

'I beg your pardon if I have been discourteous,' he said somewhat nervously, 'and as a man I sympathise most deeply with you in your trouble. But as an officer in the navy of my country I—er—my duty'——

'Oh sir,' said the girl with pleading eyes, 'your duty is our destruction! All we ask is that you will wait two hours—one hour. My father, the governor, has great influence, and we are certain that if he only has a little time—just a little longer—he will be able to save us. But if you go on, the people—they will break loose—go mad—and it will be terrible—terrible!'

Now Peele knew that it was only fear of the governor—an adventurous Irishman called O'Hara, who had made his way by sheer strength and audacity—that kept the turbulent South American populace of St Jago in hand. He knew also that the man had great influence with both high and low; but he did not share the daughter's confidence in her father's ability to effect a settlement of the international squabble. Besides, his orders were explicit; they admitted of no quibbling; moreover, they were known throughout the squadron. His sympathies were touched, but there was only one course open to him.

The girl received his reply with a look of incredulity and horror. Then her lips tightened, and a curious expression crept into her dark eyes. 'Then you will not wait—you cannot wait?' she said, almost in a whisper, gazing fixedly at the captain.

Peele shook his head, and then uttered a cry of alarm. 'Good heavens,' he muttered, 'she's fainted!'

He dashed across to a spirit-cabinet, took out some brandy, and hurried over to the girl, who lay prone where she had slipped from her chair. As he stooped to raise her he noticed a faint, curious odour; but before he could identify it a pair of strong young arms seized him round the neck, pressing something soft and suffocating against his mouth and nostrils; and before his brain could adjust itself to this new surprise he was incapable of thinking at all.

CHAPTER II.

HE awoke with the echo of a crashing noise in his ears, and instinct made him struggle up into a chair. But the effort showed him how sick and dizzy he was, and he sat motionless, while his brain and senses slowly awoke from their stupefaction. He realised that he was in his cabin, and that the semi-darkness and the noise he had heard were due to the armoured hatch being let down over the starboard light. This started a train of memories, and gradually the events of the day came back to him—the wireless message to shell the city, the preparations to carry out the order, the interview with the governor's daughter.

The blood rushed to his head as he realised what had happened. He looked round wildly, saw the brandy on the table beside him, and almost emptied what remained of the liquor. The spirit steadied him. He got on his feet, switched on the light, and sat down again to think out his position as coolly as he could.

There was no doubt that the girl had chloroformed him; but why? And where was she, and what had happened since? He looked at his watch. Considerably more than an hour had passed since he entered the cabin.

A knock came at the door, and Commander Pawson entered. His eyes shone and his voice wavered to a falsetto, as was his habit when excited.

'Wireless message just received, sir. Thought I would bring it in myself.'

Peele took the deciphered telegram in a rather shaky hand: 'Take no action. Stop. Matter arranged satisfactorily.'

'Cutting it rather fine, sir,' remarked the commander. 'Ten minutes later and it would have been too late. And I wonder who'd have been the scapegoat,' he added to himself, looking at Captain Peele thoughtfully.

'Yes,' said the captain absent-mindedly.

Something in the captain's voice and appearance caught the commander's attention. He eyed Peele narrowly, and a look of concern came into his face, for the captain was a popular officer. Peele, looking up suddenly, met his junior's gaze, interpreted it, and smiled. 'Somehow or other I feel a bit seedy, Pawson.'

'You're not looking well, sir. Shall I send the doctor along?'

'N-o, thanks; I don't want any of his messes. I'll turn in early and sleep it off. That'll do me as much good as anything.'

When the commander had gone Peele went to the door and beckoned to the sentry. 'Has any one wanted to see me, Martin?'

'Only Mr Rogers, sir.'

'Why didn't he come in?'

The marine looked troubled. 'Well, sir, the gentleman said as 'ow you was very busy, an' didn't want to be disturbed on any account. So I'——

'Oh yes, yes. Quite right, Martin; I forgot. Lemme see; how long ago was that?'

The man reflected. Just then six bells was

sounded. His face cleared suddenly. 'Egzackly a hour ago, sir. It struck four bells as 'e was speakin' to me.'

'Um! Pass the word for Mr Rogers to see me at once, will you?'

The captain's clerk came in, and Peele resolutely concentrated his thoughts on his belated correspondence. Having cleared that off, he was free to reflect upon the mystery of his fair visitor's extraordinary action. He summarised the facts. The girl had come with the avowed object of persuading him to defer the execution of his orders. Peele saw no reason to doubt the genuineness of the plea; her whole behaviour was consonant with such a purpose. Moreover, the wireless message was evidence that she spoke the truth. Finding that he was not to be moved, she had cleverly rendered him senseless. Then she had quietly returned to St Jago; but he calculated that a quarter of an hour at least had elapsed between the time he lost consciousness and her departure from the ship.

The key to the mystery lay in those fifteen minutes. Of that he felt certain. But, think as he might, no adequate motive for the girl's desperate action suggested itself to him. Her purpose was not robbery—a thorough search proved that nothing was missing from the cabin. He was forced to the conclusion that her attack on him was directly concerned in some way with her desire to avert the shelling of the city. Now that he could review the affair calmly, it seemed to him that her attitude throughout was too strained, too hopeless, for that of an envoy who expected any good to result from mediation alone. It seemed as if she was purposely hurrying on the interview to what she foresaw must be its inevitable conclusion—if her desperate ruse succeeded. But, assuming all this, it only focussed the light of inquiry more strongly on that mysterious quarter of an hour. For it was ridiculous to suppose that any one, however sanguine, could think that the carrying out of an important political order to the squadron would be frustrated by anything, however untoward, which might happen to its senior officer.

Thus Peele argued, pacing the floor of his cabin; but he could find no reasonable theory to explain what might have taken place while he lay insensible, with his visitor free to act as she pleased. For an hour or more he struggled with the problem, and the result of his cogitations is best expressed in his own summing up: 'Well, she was a darned pretty girl, and a darned plucky girl; and if this business has driven her out of her mind it's a rotten shame, that's all.'

But he was not allowed to leave the matter there. Just as he had decided to dine alone in order to avoid the possibility of awkward questions from Commander Pawson, that gentleman presented himself with a flimsy in his hand. He looked puzzled. 'I don't know what they're thinking about in the flagship, sir. This has just come from the wireless room.'

Captain Peele drew his eyebrows down until they nearly met as he read the message: 'Suspend operations. Stop. Settlement arrived at. Stop. Letter follows.'

'Surely the admiral didn't think we should be such fools as to misunderstand the previous message?' went on the commander. 'Shall we ask for an explanation, sir?'

Peele did not answer for a moment. When he did he spoke slowly, without looking up, as though his mind was occupied with something that did not directly concern the matter in hand. 'N-o,' he said; 'no. I don't think it's worth while. Probably he is over-anxious about it. We've carried out the order, and that's the main thing. But I'll keep the two messages myself in case any question arises.'

Captain Peele dined alone, with the two marconigrams on the table beside him. It was his custom to take one glass of port at dessert, and as he put the empty glass down he nodded to himself in a mirror opposite very solemnly and deliberately. He had formed a theory which, if correct, would explain the strange happenings of that evening. It was only a conjecture, and the opportunity might never come to test its truth; for of one thing he was thoroughly convinced—that it was to his interest never to speak, save perhaps to one person alone, of what had befallen him that night.

. . . . . .

Six months afterwards Peele was walking down Pall Mall with a little flush on his handsome face. The flush deepened as he saw a young, trim-bearded man disengage himself from the passers-by and make straight for him.

'Congratulate you, Sir Fitzroy. You've got something we can never hope for in our enlightened and democratic country. Shake.'

'Thanks, old man,' said Peele, grasping the other's outstretched hand. 'Though what I've done for it I don't quite know.'

'Wal,' drawled his friend, 'you pulled out the chestnuts, anyway; and now you're eating 'em, I guess. But how you did it *I* don't quite know—nor any one else. There's a queer absence of information about what happened around St Jago just before the curtain rang down, eh?'

In Peele's mind came a picture of a flushed, dusky-haired girl, in a military uniform, facing him with glowing eyes across the table of the *Invulnerable's* cabin. He smiled a far-away, reflective smile; and if the other thought he was going to hear something interesting he was mistaken.

'What's this crush at your Embassy to-night going to be like?' was all Peele said.

The other laughed. 'Oh, the usual thing.

Coming? You'll meet one or two interesting people there. Come and dine with me, and we'll go on together.'

Peele, who had only mentioned the function at the United States Embassy to turn the subject, saw that he was cornered, and agreed.

They sat long over the meal, talking about old times, for Peele and Captain Van Sittart, now the United States naval attaché in London, had been through the Russo-Japanese war together. Thus they arrived in Park Lane somewhat late in the evening. After the usual presentations, the two were making their way through the crowd, when Peele suddenly stopped short and clutched Van Sittart by the arm.

'Who is that—that tall, dark girl over there, beside the short man with the dark moustache?' he asked in a quick whisper.

Van Sittart followed his friend's gaze. 'Gee!' he exclaimed, 'you ought to know them. That's Miss Norah O'Hara and her father, Governor Denis O'Hara of St Jago. Say, how did you miss 'em out there? She's a thoroughbred; and as for her father, he's quite the biggest and richest man on the Pacific slope. Come along; I'll introduce you.'

As Peele followed in the wake of the attaché his heart beat fast for all his apparent coolness. He had long ago mapped out his line of action if he should chance again to meet the envoy of St Jago, but the sight of this sweeping beauty in white thrilled him with a new emotion, and awoke all his sailor's diffidence. Moreover, he had clean overlooked the fact that the governor would assuredly know as much as his daughter about his (Peele's) discomfiture.

'Miss Norah and Governor O'Hara, let me present to you Captain Sir Fitzroy Peele of the British Navy. Say, you needn't be afraid of him here, governor; he's left his little guns behind him this time.'

As their eyes met Peele saw the girl give a little start of recognition. With a sudden boldness the captain held out his hand.

'How do you do, Miss O'Hara? I think we have met before.'

As the girl blushingly placed her hand in his Peele caught a glimpse of Van Sittart's look of astonishment.

Then above Miss O'Hara's somewhat confused commonplace rose her father's cheerful voice: 'Afraid of him, bedad!—So ye're the lad who was goin' to blow our poor little St Jago into the sea. Faith, I'm plased to meet ye, and I compliment ye, sor, on yer humanity.'

Peele shook hands and muttered something more or less appropriate, and at the first opportunity turned to the girl, with perplexity and interrogation in every line of his handsome face. Mischief, but also understanding, gleamed in her expressive eyes, and Peele, with a sailor's promptitude, decided on his course.

'Miss O'Hara and I have lots to talk about, and we're going to have a quiet chat,' he said unblushingly in his frank, taking way. 'You don't mind, do you, sir?'

'So ye have!' said the little governor. 'An' if ye didn't want a chaperon whin ye fixed up St Jago between ye, ye don't want one now. An' I want a dhrink.—So come along, Van Sittart.'

As O'Hara and the amazed attaché moved away, Peele smilingly offered Miss O'Hara his arm.

The girl caught her breath. Then her eyes danced, and, with a little shrug of her shoulders expressive of much, she let herself be swept away by Peele's masterly handling of circumstances.

The captain deliberately selected a dim and secluded alcove, and found her a chair. Her face was half-turned away from him; her lips were parted in a little, mysterious smile; and for a moment Peele gazed at her faintly illumined profile with an absurd and rapturous sense of intoxication. Then he spoke. 'Your father, the governor, then, does not know all that took place in my cabin in the *Invulnerable* six months ago?'

'My father has a very high opinion of Sir Fitzroy Peele's humanity and—er—diplomacy,' said Miss O'Hara, glancing at Peele demurely.

'He must also have a very high opinion of his daughter's courage and—er—diplomacy,' said Peele.

'He has,' said Miss O'Hara calmly.

'Tell me,' said Peele, 'do you always telegraph to your enemies in the British cipher code?'

'Always,' said the girl emphatically, 'when they keep the code-book in a cupboard in their cabin, and the key on their watch-chain.' And her eyes danced with merriment.

'Do you think it was—er—strictly fair?'

'All is fair in love and war, Sir Fitzroy.'

'All is fair in love and war!' repeated Peele musingly. 'So that is your maxim?'

'Most assuredly.'

'Then would it be fair for me to call and see you to-morrow?'

The girl turned her head away, and Peele saw the warm colour tinging her shell-like ear. One little gloved hand lay on the settee near him, and, taking it unresisted, Peele bent forward to hear her answer.

'Yes,' she said very softly, 'I think—I think perhaps it would.'

THE END.

CONCERNING COATS OF ARMS.

By Sarah Wilson.

THERE is an old saying that it takes four generations to make a gentleman. This popular impression must be considered with care before acceptance; for the sovereign, being the fountain of honour, can bestow rank when and where he pleases; and thus three of the generations supposed to be necessary can be swept out of the way at the royal pleasure. The conviction may have grown from the concession in Ireland that those families who have used coats of arms for three generations are entitled to have them recorded in the books of Ulster King of Arms. There remains the fact that distinguished ancestry bears a noble share in our appreciation of people using armorial bearings. We look with extra interest upon the present representatives of the knights whose names are inscribed on the Roll of Battle Abbey, for instance (Sir Walter Scott consulted this for designations for his characters in *Ivanhoe*, including Front-de-Bœuf), or upon those in direct descent from the first knights of the Order of the Garter, or who are associated with similar amalgamations of romance, chivalry, and history, like Crusades. It happens that heraldic devices were used to distinguish individuals long before the foundation of the Heralds' College; therefore it comes to pass that we have among us identified descendants of men who were great before it was aught. It is well for those who incline their hearts toward matters of the kind that there are many rolls still extant containing lists of knights engaged in various undertakings in long-past centuries, such as those who assisted King Richard the First in the siege of Acre.

Over and above languages, always used with the utmost compression, the heraldic world has two other modes of expression—namely, devices and colour. In this way those who have gone before us still speak to us with a kind of eye-talk. Their achievements, or escutcheons, tell us, if not how 'they warred, they sang, they triumphed, and they passed,' at least from whom they were descended and with whom they intermarried. In addition to documents and pedigrees carefully preserved in the Heralds' College, British Museum, and private muniment-rooms, we have to look at the effigies, brasses, and tombslabs in our old churches, at the tiles upon the floors, and at the stained glass in the windows, many of which are rich with armorial bearings. The Bayeux Tapestry displays devices on the shields of the adventurous warriors depicted on it; but neither true armorial banners nor shields of arms came into use until the 12th century.

Occasionally general attention is drawn afresh to this sub-world by publications touching upon its confines or laying bare some of its details. Such a work was undertaken by the late Mr Joseph Foster, a relative of the distinguished artist Birket Foster. His handsome volume entitled *Some Feudal Coats of Arms* is embellished with a very large number of armorial bearings and engravings of effigies. He tells us the principal sources of his information are the rolls containing the personal insignia on the vestments and banners of the knights who fought at Falkirk in 1298 at Caerlaverock in 1300, at the battle of Boroughbridge in 1322, and at the siege of Calais in 1346; and, in addition, the lists of the knights who took part in the tournaments held in Dunstable in 1308 and 1334. The descendants of these warriors, he remarks, constitute in very deed the *ancienne noblesse* of to-day. It is curious to observe how many ancient lines are extinct. In the case of the two hundred and seventy Knights of the Garter created before the reign of Henry the Eighth, only thirteen are now represented in direct male descent. On the other hand, it is a matter of surprise to see in the published pedigrees the number of noblemen and gentlemen who claim royal descent or affinity. The identified descendants of Edward the Third, for instance, are numerous.

One of the pedigrees given by Mr Foster refers the descent of His Majesty George V. to the—probably mythical—Hengist who with Horsa was said to have landed in Kent in 449 A.D. at the request of the British Vortigern, then harassed by Picts and Scots. Wittekind, the duke of the (Continental) Saxons, who fought with Charlemagne and was conquered by him, is given as a descendant of Hengist. Through a long succession of Margraves and Electors in the course of centuries, while the throne of England was filled by Normans, Plantagenets, Tudors, and Stewarts (with Anglo-Saxon blood in their veins), the Continental Saxon line is brought down from Wittekind to the princes of Saxe-Coburg and Gotha, one of whom was the grandfather of our King. As Mr Foster says, the pedigree suggests that the Continental Saxons reacquired the British throne in the person of his late Majesty King Edward the Seventh!

Some old-world editors of heraldic works actually based their investigations upon the insignia of the Hebrew tribes when wandering in the wilderness, contending that they were brought out of Egypt in military array, with standards and insignia as described in the Book of Numbers. They tell us the tribes were divided into four squadrons, under Judah, Reuben, Ephraim, and Dan. Emblazoned on the standard of the first was a golden lion; on that of the second a man or male child, or, as some say,

three bars wavy azure, in allusion to the declaration of Jacob, 'Unstable as water, thou shalt not excel;' on the banner of Ephraim was a sable ox; and on that of Dan was an eagle with a serpent in its talons. Other authorities take up the subject as exhibited in ancient Greek vases on which heroes are shown with devices on their shields; and some begin with the symbols on our buildings, on the armour and vestments on effigies or brasses, or on fonts, pulpits, pillars, and paving-tiles. Many brasses, like windows, give the proper colours of armorial bearings.

It is not all of us who cherish appreciation of noble names, but there are few who cannot feel the romance of the deeds that gave distinction and rank in the first instance. Even the sternest and most philosophical minds do not disdain the imputation of a love of arms and all that it represents. Carlyle tells us Mr Gracie of Dumfries traced the Carlyle family to the first Lord Carlyle, and thus to the brother of the murdered Duncan. 'What laughing my darling and I had when that document [Gracie's genealogical-tree of the Carlyle family] arrived!' he wrote. And Dr Johnson argued with Boswell that every man thought meanly of himself for not having been a soldier. 'Were Socrates and Charles the Twelfth of Sweden both present in any company, and Socrates to say, "Follow me, and hear a lecture on philosophy;" and Charles, laying his hand on his sword, to say, "Follow me, and dethrone the Czar," a man would be ashamed to follow Socrates. Sir, the impression is universal; yet it is strange.'

Looking at the devices chosen for coats of arms in Plantagenet times, we see that many of them make allusion to the names of their owners. Swine-heads and boar-heads, for instance, appear more than once on the shields of warriors whose names refer to those animals, as in Swinburne and Swinnerton; gauntlets were chosen by a mediæval Gaunt, maunches by a Maunsell, picks by a Pickford and a Pigot, trumpets by Trumpingtons, hands by Malmain, lambs by Lambton, hunting-horns by Hornes, bows by Bowes, three hammers by Hamerton, keys by Chamberlains, ravens by Corbets, herons by Herons, wings by Wingfield, a muzzled bear by FitzUrse. This adoption did not prevent the use of the same device by owners of other names. There was no limit, apparently, to the choice of animals. Lions were the favourites; after them leopards' heads and bucks' heads, horses, and in some cases talbots were chosen. The horseshoe was also appropriated, and the unicorn. There was a larger choice in birds — owls, cocks, ravens, herons, and popinjays being all represented, and martins without feet, called martlets. Hawks' lures were chosen in two instances. There were also (and still are) many fish in this mute language, such as dolphins and mullets. The great bulk of display in this kind of pageantry, nevertheless, consists of conventional items, such as crosses of very many forms, all of recognised meaning, bars, bendlets, roundels, stars, crescents, fusils, lozenges; and across many of them we see a label to denote the elder son of a father still living. Many common and uncommon objects occur, such as lamps, staves, pens, plumes, cups, helmets, boughs of trees, and leaves. A varied arrangement of chess rooks was chosen in at least three known instances, which, in connection with Froissart's account of the way King Edward the Third played chess with the Countess of Salisbury, opens out a view of the popularity of this game before Caxton's time.

The colours employed are another study of intricate detail. They were said to be symbolic, and are thought to have once had the same significance among all nations. In blazonry, white or argent is understood to mean purity and innocence; yellow or gold, love, constancy, and wisdom; red, blood and fire; blue, loyalty and fidelity; and green, joy and abundance—differing slightly from their ecclesiological interpretation.

When a stand of colours (with another sense of 'colour') is presented to a regiment to-day, it means much; but it means something quite different from what it did when William landed in Sussex, or Edward set out for Scotland, or the French and English kings saluted each other on the Field of the Cloth of Gold. '"Here is my banner," said Sir John Chandos on the morning of the battle of Navarete to the Black Prince. Then the prince and the king took the banner, which was of silver with a sharp pile *gules*, and returned it to him, the prince saying, "Sir John, behold your banner; may God grant you may do your duty." Then Sir John bore it to his own company, and said, "Gentlemen, see here my banner and yours; preserve it as your own."' And straightway, as we read the blazoned page (Froissart's), or view the picture mentally portrayed by it, we are aware of the spirit that pervaded the users of coats of arms in old times.

A QUEST.

One face amid the crowds I seek,
The careless crowds that hurry by;
Through summer shine and winter bleak
To hope I will not say good-bye—
One face I seek.

One face I seek! God send the day
I find it, be it soon or late;
I know her eyes will turn my way
At the compelling call of Fate—
One face I seek.

One face I seek, and, if my quest
Be vain, until the day I die
I'll bear its image in my breast;
And still, and still beyond the sky,
Amid the rapture and the rest,
One face I'll seek.

SEVENTH SERIES

A WANDERER'S NOTE-BOOK.

By A. F. WHYTE, M.P.

IN BELGIUM—*continued.*

THERE is a saying attributed to an English lady of the mid-Victorian period on her return from a tour on the Continent. She was requested to give her impressions of foreign countries, and she replied that they were 'mostly ruins, inhabited by imbeciles.' We are happily far enough removed from that time to be able to smile at the insular presumption of her words, though the spirit that prompted them lurks in varying degree in many of us to this day. The industrial expansion of Germany, for instance, has opened our eyes; her rivalry in armaments and trade has forced upon us the study of her people and her methods. In another direction, and with the completest difference of origin and result, the *entente cordiale* with France has swept away old enmities and established what promises to be a lasting friendship not only between the Governments of Great Britain and France, but also, in a very gratifying sense, between the two peoples. Denmark, in her turn, claims our admiration for her systems of popular education and scientific agriculture, by which she has raised herself from the dire straits of 1864, and has more than made good the loss of the two duchies. Norway has shown us, by her admirable system of public-house reform, how to subdue one of the gravest of our national evils. And so on. During the last years of the nineteenth century we awoke to the fact that our 'splendid isolation' had left us all but entirely ignorant of the world of thought and action in Western Europe; and we set about to dispel our own ignorance. It is curious to note that, in the process, we have practically ignored one of the most interesting and instructive of our neighbours — namely, Belgium.

The average Briton thinks of Belgium—if indeed he thinks of her at all—as a kind of *annexe* to France; he has some recollection, perhaps, of having heard something somewhere about the Forest of the Ardennes; Brussels he associates vaguely with sprouts and music; and as his memory brightens he will tell you that the country possesses a famous battlefield which has given its name to one of the London railway termini! As for her history, 'why, didn't she not so long ago escape, by the death of the late King Leopold, from the rule of an unscrupulous and dissolute monarch whose iniquities in the Congo Free State made him notorious from Gibraltar to the Baltic?' If he has a taste for the study of guide-books he may remember those lines of Latin doggerel in which a medieval monk celebrated with commendable brevity the contemporary virtues of six Belgian towns:

> Nobilibus Bruxella viris, Antwerpia nummis,
> Gandavum laqueis, formosis Bruga puellis,
> Lovanium doctis, gaudet Mechlinia stultis—

'Brussels breeds statesmen, Antwerp breeds wealth, Ghent has its halters, Bruges its pretty girls, savants flourish in Louvain and fools in Malines.' But beyond such scraps of travellers' gossip his knowledge does not extend.

Belgium is a small country (about twice the size of Yorkshire), which supports more inhabitants to the square mile, and is served by a more complete transport system of roads, canals, and railways (including a vast network of light railways), than any other country in Europe. To the statesman she offers the study of a highly developed commercial organisation, a scientific system of agriculture, and an object-lesson in the development of small-holdings in land. Each of these, in its appropriate degree, deserves our attention; but we cannot, in such random sketches as these drawn from the note-book of a 'sentimental' traveller, enter deeply into any one of them. Vast quantities of information regarding each and all of them lie rotting in the Consular Department of the Foreign Office and the pigeon-holes of the Board of Trade. All I can do, in passing, is to put my hand at random into such pigeon-holes as I know, and give you samples of the untouched store of facts.

Take the consular service as an instance of commercial organisation in Belgium, and you will soon see how much we may learn from our neglected neighbour. 'Belgian diplomatists,' says Sir Constantine Phipps in a report to the Foreign Office a few years ago, 'little absorbed by international questions [happy men!], devote their main attention to commercial matters and to the extension of Belgian export trade, and require no commercial attachés to assist them. They are obliged, on entering the service and at

 [*All Rights Reserved.*]

certain stages of promotion, to pass difficult examinations on economic subjects; and it is to be doubted whether in any other diplomatic service persons could be found so thoroughly versed in such questions. The Belgian consul renders, moreover, services such as can be obtained from the consuls of no other nation, even to the extent of assisting in the collection of debts, in the arrangement of litigious questions, as well as making close inquiries into the credit and reliability of individual commercial houses abroad. The consuls act as pioneers of Belgian trade.' They are, as a rule, graduates of the Institut Supérieur de Commerce at Antwerp, which is the merchants' university and the special training-school for all branches of commerce, as well as the consular service. For two years, often for three, the prospective consul pursues his studies; the first year being devoted to training in the routine of a merchant's office, in advanced commercial arithmetic, rates of exchange, bills of lading, marine insurance, commercial correspondence in at least three foreign languages, and a few other cognate subjects. The second year's course carries the student forward into political economy, commercial law, the study of protective tariffs; with a weekly lecture, illustrated by models, on the main conditions of modern shipbuilding. A glance at this curriculum shows how thorough is the commercial equipment with which the Belgian goes out to face the competition of his rivals. If he is fortunate he may obtain a travelling bursary from the Government in order that he may extend his commercial knowledge by visiting countries outside Europe. Such bursaries are tenable for three years, and are large enough to enable the holder to make extended journeys in search of openings for Belgian trade in Asia, Africa, America, and Australasia, of which he must furnish full half-yearly reports to the Commercial Department of the Belgian Foreign Office. The results of this system are regarded with high satisfaction by the Government and the home manufacturers; and there is no doubt that it forms a most valuable training for the consular service. Our own Foreign Office and the Board of Trade would do well to ponder these things, for they are essential to the continued well-being of those many millions of our fellow-subjects whose very existence depends upon the maintenance of our immense foreign trade.

For another instance, take the transport system of Belgium. In my first article I spoke of the miraculously cheap *Rundreise* tickets provided by the Belgian State railways; and I think I can prove that the epithet is not extravagant. The railway rates in Belgium, both for passengers and for goods, are usually very low, partly owing to the competition of the canals, and partly owing to the fact that the Government deliberately pursues the policy of low rates for the encouragement of industry and commerce, the development of the export trade, and the capture of as much as possible of the transit trade from South Germany to the sea. For nine shillings and fivepence a third-class passenger can travel anywhere over the two thousand eight hundred and fifty-nine miles of Belgian State lines as often as he pleases during any given week. It may be noted in passing that the above mileage represents rather more than thirty miles of railway for every hundred square miles of territory; and if the mileage of the light railways be included, the proportion rises to fifty-two miles for every hundred square miles. Workmen's tickets are so cheap that many city artisans live out in the country, and are thus able to enjoy the twofold advantage of the purer air of the countryside and the higher wages of the town. For one shilling and threepence a farmer can send ninety pounds of perishable goods—that is, fruit or vegetables—by fast train a distance of one hundred and fifty kilometres (nearly ninety-four miles) at the State risk, whereas in England a farmer would have to pay four shillings if the goods were sent at the company's risk, and two shillings and ninepence if sent at his own risk! I need not multiply instances; for the foregoing amply prove that not only is the Belgian railway system more extensive than any other, but the freights payable are 'miraculous.' The competing means of communication offered by the canals, however, has greatly decreased the importance of the railways for heavy transport. All over Belgium there is an elaborate network of canals and 'canalised' rivers, which has not yet reached its maximum development; about 85 per cent. of these belong to the State, and *are deliberately run at a loss* of about one hundred and twenty thousand pounds per annum. The Government regards the canals in very much the same light as our County Councils regard our high-roads, as an indispensable part of the national transport system; and 'it is no exaggeration to say that the commerce of Belgium as it exists at present could not be carried on without them.' In Antwerp alone in 1904 thirty-six thousand barges, with a freight tonnage of seven million tons, entered, and thirty-five thousand seven hundred barges, of six million seven hundred and fifty thousand tons, cleared. The rates for carriage by canal are much lower—though the time of transit is, of course, longer—than for railway carriage; and they have the advantage, from the trader's point of view, of being fixed by competition among the barge-owners, and are also more easily adaptable than the railway rates, which are fixed by the Government, and cannot be varied rapidly or often. The canal rates vary almost from day to day, and are quoted every morning on the Antwerp Exchange.

As the industry of agriculture is the most important in Belgium, and its prosperity, therefore, of vital consequence to the general welfare of the

community, it is not surprising that the Government has devoted its energies and financial resources to the development of scientific methods of tillage, of co-operation between agriculturists in nearly all their activities, and of general agricultural instruction. Out of the manifold organisation of the Ministry of Agriculture I select one branch for special mention here—namely, the State Experts in Agriculture (*Agronomes de l'État*), who number thirty-five—twenty-seven principals and eight assistants. Two or three of these are permanently established in the office of the Minister of Agriculture in Brussels, the others being in separate districts all over the country. Their duties include the promotion of agricultural organisation by means of co-operative societies and credit banks, the arrangement of practical lectures of a popular kind for farmers and others on all manner of agricultural subjects, the conducting of experiments in seed-testing and new kinds of fertilisers, &c. Details of their work can be found in several published reports and in other publications, of which Mr Rowntree's book, *Land and Labour, Lessons from Belgium*, is the latest and best. Setting aside, therefore, any further researches into the system as a whole, I think I can best give you an idea of the services rendered by these *Agronomes de l'État* by taking you through the day's work of one of them.

Rising early, the Belgian *agronome* takes a morning stroll round the experimental plots under his charge, in which he gives new seeds a thorough trial before commending them to the farmers of his district. He passes from one plot to another, noting the progress of his various experiments, and returns to his house, where he finds a pile of letters awaiting him, among which the most interesting are those addressed to him by individual farmers in his capacity as expert adviser. The following are typical specimens of the inquiries which reach him:

(*a*) Would you advise me to put chemical manure—and what sort—on a temporary pasture (six years old) before sowing winter barley? How many kilos are needed per hectare; and what else must be done to the soil before sowing?

(*b*) When you were here to lecture you told us about the Raiffeisen Bank. Would you be good enough to let me know what steps I must take to become a member?

(*c*) My wife has begun poultry-keeping, and doesn't know much about it; nor do I, for that matter. Can you give us advice as to (1) the best breeds for laying, (2) the best things to feed the birds with, (3) the proper way to pack eggs for the railway?

(*d*) As secretary of the co-operative creamery here, I write to ask whether you can send me the syllabus of your lectures on dairying. We want lectures here next winter, and I wish to lose no time in arranging them.

Such answers as he can write without consulting his books or the Brussels Ministry are sent off at once; the remainder are reserved for his evening leisure. In the afternoon he attends a neighbouring market, mixes with the motley crowds, acts as impromptu arbiter when disputes arise, and converses with the farmers, discussing 'the weather and the crops,' giving advice, and hearing complaints. New faces strike him at once; and as he chats with old friends about their families, fields, and herds, he observes a stranger prowling round the group of which he is the centre, and obviously waiting for an opportunity to talk to him. He breaks out of the circle and accosts the new man. They talk together about this and that—the dryness of the season, the new canal that the Government is building, the high hopes that are entertained about the coming of a light railway to the village, &c.; and the *agronome* soon finds that he is dealing with a novice who has so far failed to get his bearings in the new community.

'How's the manuring getting on?' he asks.

'*Peste!* not so well. It's not much use. The stuff's too dear, so I can't buy enough; and, even if I could, it costs a lot to fetch it here.'

'Oh, where do you get it?'

'From Ghent.'

'From Ghent! Why, man alive, what possessed you to go to Ghent for it?'

'A man in St Amand told me before I came in here that you could get good stuff in Ghent, so I get it from there.'

'Who told you that?'

'A lawyer who fixed the transfer of my farm for me before I came away.'

'A lawyer! Hum! We don't let lawyers shove their noses in here, I can tell you. And I don't know what your society is doing, letting you pay through the nose to some rascal in Ghent. The other men about here,' continues the expert, 'don't complain as they used to do that the price is too high. They used to pay retail prices; but that was because they bought their stuff in small pieces, separately. Now they get it through their society at practically wholesale prices, and save a heap of money from year's end to year's end.'

'What society?' asks the new-comer.

'*Sancta simplicitas!* where *did* you spring from? They have societies in France, haven't they? You came from over the border, didn't you?'

'Yes, I came from France, and I wish I hadn't; it's no use here. Societies? Oh, they have them in some places, but I never joined one.'

'That's perhaps why you couldn't make it pay—your farm in France, over the border yonder! And, *mon ami*, that's why you're finding it such poor fun here. What do you think? Isn't it?'

'I don't know. Perhaps it is.'

'Well, look here,' says the expert, 'it's no

earthly use trying to make a decent job of farming here without the societies. Oh, you may make ends meet, but you'll have a dog's life in doing it—a dog's life, I tell you. All these men,' declares the expert, waving his hand round the busy market—'yes, all of them—are in societies of one kind or another. And if you want living, walking testimony to their value, there, do you see that tall, gray-haired man over there? Well, he got a good many of his gray hairs from trying to work by himself. He was an independent kind of fellow, didn't believe in "these newfangled notions of clubbing together," said he could manage better on his own. Well, he just couldn't; he was gradually being elbowed out, and had to come in eventually. He's now a member of three societies, and secretary of one of them. Looks pretty prosperous, eh?'

'Yes, he does. Perhaps that is the way out,' says the French novice.

'You'll see soon that it *is the way out*. You think it over. I'll see you again about it; but, in the meantime, that short, red-faced man over there, with the brown leggings, can tell you more than I've time to do just now. Go and talk to him; tell him I told you to. Or, no; I'll introduce you myself, and give you a start with him.'

So the novice learns that there are societies for buying feeding-stuffs, societies for buying artificial manures, societies for insuring live-stock, societies for giving loans to farmers, societies for marketing eggs and dairy-produce; and they are all for him if he wants them. No one questions that he needs them. He goes home with something to think about and a new hope in his heart.

The work of the *agronome* is over for the afternoon, and he returns to his fireside to wrestle with the problems in the letters which he set aside in the morning.

THE CAHUSAC MYSTERY.

CHAPTER XI.—THE SYMPATHY THAT GROPES.

WHY did John marry Kitty? John, with his strong, single-hearted nature, takes unto himself and adores as the one jewel of earth—for a limited period until his eyes are opened—the simple-minded, soft-hearted girl who loves him devotedly, but not one whit more than she would have loved James or William or Tom, had any one of those very commonplace young men become her husband and been decently kind to her.

Philosophy and social science, and the many specialised forms of study which we have brought to bear upon mankind, after all these years, have taught us nothing reliable about the master-passion. We love still according to no rule, after the lines of no theory; reason has no say in the matter, and expediency is out of court. A man loves from the eye, a woman from the heart; but equally by chance, so to speak.

At 241 Park Lane Cahusac found Mrs Westaway. She had once been a pretty girl, and was still pleasant to look upon; naturally good-humoured, well-meaning, and impulsive, but somewhat warped by contact with the world. She received Cahusac with an air of gloom.

'Oh my dear boy, you may well ask what is the matter! Have you heard of Wil's wickedness? We all knew he was frightfully in debt, and it now turns out he has been raising funds on the strength of a promise made him by Alice that as soon as she got her fortune into her own hands she would make it over to him to satisfy his creditors! To complete the mischief, Alice vows she will keep her word. Have you ever heard of anything so utterly unprincipled?'

Mrs Westaway shook out a fold of her soft laces impatiently, and, leaning back among her cushions, looked at Cahusac for sympathy.

'I cannot believe that Wil intended'——

'I'm not speaking of Wil. We all know, delightful boy as he is, that he would swindle his own grandmother out of her last sixpence, only she happens to be well aware of his little ways. Not at all! I mean Alice.'

Cahusac smiled strangely. 'You brought her up, Mrs Westaway.'

'Malcolm, I have known you from a boy, and I said from the beginning that you were at the bottom of this!'

Cahusac stared at her.

'Yes, I said it was just like one of Malcolm Cahusac's quixotic notions. You may ask Wil if I did not.'

'I assure you I have never exchanged a single word with Alice on the subject; but one may be permitted to respect her point of view.'

Mrs Westaway resumed her seat with some air of relief. 'I am glad to hear you haven't—more glad than I can say. She quoted cases of people who had kept vows made for them when they were babies—kept them to their own hurt. She mentioned no names, and I am sure I don't know why I thought of you,' she went on, not noticing the mingling of embarrassment and elation which crossed Cahusac's face.

'But don't you think she is right?' He put the question in his usual indifferent tone.

'Right? Certainly not! Of course one should be truthful and upright, and all the rest of it; but when it comes to flinging away your whole fortune to the Jews, and living on your family, because you happen to have been silly enough to make a stupid promise before you knew to what

it pledged you, well then I am of opinion that no one but a fool would do such a thing. It is quite as criminal to sponge upon your relations as to decline to fulfil a ridiculous and illegal arrangement.'

The servant opened the door, and Mrs Westaway added hurriedly, 'Here is Alice. I will leave you with her, and for goodness' sake persuade her to be sensible.'

Alice came into the room, and greeted Cahusac with that air of dignity and slight reserve characteristic of her race and class. It is a trick of manner, perhaps, and may not represent any inborn quality; but it invariably stands its possessor in good stead. Alice's reserve was discounted on this occasion by a deep blush when she became aware of the identity of the visitor. 'I did not expect to see you,' she said, 'at this hour.'

'I happen to be my own master just now,' Cahusac answered. 'I am going to Paris to-night.'

'To Paris! How odd! Wil is going too, with M. de Sarsan.'

Cahusac's face altered. She was watching it anxiously.

'I know you don't like M. de Sarsan,' she went on rather hurriedly; 'but he does influence Wil.'

'For good?' Cahusac did not want to ask the question—it was a stupid and priggish one at best; but he was more disturbed at this meeting with Alice than he would have cared to own.

'I think I can prove it to you. Has not Aunt Ella asked you to try to make me take a sensible view of my obligations as regards my promise to Wil?'

Cahusac flushed hotly and foolishly as he acknowledged that she had.

Alice's smile took on a little turn of sadness which stirred him still more strongly. 'She asks everybody. I wish she would not speak of our affairs so much and so openly. It is very painful.'

'I am afraid no apology of mine will mend the matter; but I can say that I did not venture to think of offering you my advice,' he replied with the quick huffiness of a man in love.

Alice was the type of girl who is readily loved; the type of girl, soft-natured and innocent, whom most men fall down and worship, and who, with their gentle dignities and stainless lives, have been the home-treasure for whose sake Englishmen, under the name of England, conquered Napoleon. Half the race have their lives brightened and their romances translated from heaven to earth by such as these.

Her eyes of childlike blue grew misty with reproachful tears. Her reserves were only skin-deep. She answered frankly, 'If you had cared to offer your advice and help I should have been glad and—grateful.'

This was an attack at close quarters of a kind to which Cahusac was not accustomed. He stammered in his answer. 'I have found it difficult. Wil avoids me lately.'

'As I said, you dislike M. de Sarsan,' she went on, not noticing his interruption; 'but I have had no one else to help or to advise me. He agrees with me that I must make over my money to Wil's creditors.'

'Agrees with you?' Cahusac repeated in surprise, while in his mind he wondered what game the man was now playing.

'Yes; did I not do well to trust him? Besides, I have no one else.' She rose and crossed the room to the window, for the tears were falling at last.

There was a second's pause, and then Cahusac followed her. He looked at her in silence, shaken throughout his whole being by the love he bore her—all dreamy hopes and gossamer thoughts, as she was! The living appeal! And these appealing girls rarely appeal in vain. Not intellectual, not strong, not capable, but fulfilling at one period of their existence a very ordinary ideal; yet a man's ideal for all that.

Such she was, sweet and helpless and appealing, fair and dear. He looked at the soft coils of hair upon her white neck, rather astonished at himself perhaps, yet thrilled and elated. He knew in his heart even then that there were thoughts and depths of soul that she could never share. Not the rarest girl in the world is she, yet most men prefer her. She is so different from themselves; she owns all the converse qualities. She is restful, trustful, and knows nothing of the mysterious discontents of spirit, the weary ambitions, the unanswerable questions of life. Marriages may not be made in heaven; some courtships are, at any rate.

'You know I would have helped you if I could—if I had known!' he found himself saying, almost unconscious of the words, so filled was he with the sense of her presence.

She turned towards him as he spoke. 'You don't know how lonely I am!' There was no artifice in the plaintive assertion. 'I have many relations, but they don't understand. They are all against us—against Wil and me. Now M. de Sarsan has undertaken to manage everything for me. And you'——

This is the sort of thing that generally has but one result. Cahusac knew so much, and was sufficiently himself to recollect it. 'I am sorry to hear that,' he said in a firmer tone. 'I think you had much better have put your affairs in the hands of one of your family.'

Two turquoise-blue tearful eyes reproached him. It was almost more than a man could bear.

'I am very unhappy,' she said. 'I don't know what to do. M. de Sarsan is our only friend; he has been very kind.'

Cahusac felt the check of the last sentence. He longed to speak, and to speak out; to tell her he loved her; and, man-like, he longed to show her how mistaken she was in her opinion

of De Sarsan; and yet in all fairness he must be silent. Her very weakness held him back. In her innocence she might some day have learnt to love him, but he could not ask her to share the uncertain future ahead, in which it might well be that calumny would triumph against him. If he told her all, he believed that, in her unworldliness and pity, she would take no count of possible trouble or shame, but gladly link her life with his. Was ever lover in so hard a case? he wondered. The one comfort of the moment was that De Sarsan, with his wiles and covert designs, was also to be away.

'I am boring you with my silly talk,' she exclaimed suddenly, he had kept silence for so long. 'I am sorry I spoke of myself. And yet, you know what it is to be lonely and unhappy too.'

He met her eyes, and in his she saw a dumb look of pain which she never forgot.

'Do you remember once you offered me your friendship, Alice?' he broke out. 'And what I told you then I tell you now once more. I dare not take your friendship, I cannot be your friend, while I stand as I do to-day, in face of I cannot tell what reverse of fortune.'

She suddenly put out both her hands to him. The action was so natural, so wistfully kind, so eloquent of the unuttered cry, 'Let me stand by you, let me comfort you!' that he could hardly crush back the answer which burned so near his lips.

It was the moment. He was on the path where one loses count of time. As long as there are two upon it they wander, taking no heed of distance. It is only when one is left to return alone that the way grows very dreary and very long.

'A man's fate is stronger than his will and his desires sometimes,' he said tenderly. 'If he can break free, then he is his own master, to do as he pleases. But until that moment he must be bound by his honour.'

He had taken both the slender outstretched hands in his own, pressing them hard in his emotion. She drew nearer with a timid movement.

'I don't understand you; but I am so sorry for you, Malcolm.' The red lips quivered, and her very loveliness translated her speech into comfort to Cahusac's ears. He could not look longer at the sorrow and supplication of her face.

'The future holds all my hopes—my life,' he muttered, as if to himself; then, seeing the marks of his rough grasp upon her white fingers, he suddenly bent his head and kissed them once and again with passion.

He was gone. She remained very still, one hand holding the other for many minutes. Then, blushing deeply to the brows, she kissed the place where his lips had been.

'I care for him very much,' she said softly. 'I wish I knew what trouble he fears will come to him. But I am sure he cares for me—and he is very unhappy.'

(To be continued.)

MONEY-BOXES.

By G. L. Apperson.

THE latest development of official ingenuity for the encouragement of thrift, the provision of money-boxes by the Post Office Savings Bank for the reception of small deposits by youthful depositors, is a wise adaptation to official ends of an ancient institution. The association of money-boxes with the national system of savings-banks is new, but the money-box itself is as old as the hills. Boys of every generation have probably repeated the familiar experience of dropping coins into their money-boxes in thrifty moments, only to make the most ingenious attempts to regain possession of the deposits when, the spasm of thrift having passed, the need for coin became immediate and pressing.

The Post Office, while providing the box, wisely intends to retain the key. The most effective of the older money-boxes were those which, while offering an accommodating slit for the insertion of coins, provided no means for the withdrawal of deposits short of smashing the receptacle, which was commonly of earthenware. But as this kind of 'breaking the bank' was somewhat of an extreme measure, the youthful depositor who wished to recover deposits too hastily made was reduced to a prolonged shaking and wriggling of the box, in the attempt, usually unsuccessful, to induce a coin to return by the opening through which it had entered.

Money-boxes, or money-pots, as they were sometimes called, were in very general use long before banks were invented. Roman money-boxes may be seen in museums. A seventeenth-century writer describes a 'Roman money-pot fashioned almost like a pint-jug without a neck, closed at the top, and having a notch on one side, as in a Christmas-box.' Medieval examples are numerous. In that remarkable collection of mementos of the London of days gone by, the Guildhall Museum, there may be seen several earthenware money-boxes, both glazed and unglazed, of the fourteenth to the eighteenth century. One of green glazed ware, with a slit on the shoulder for the reception of coins, has plainly been broken at the bottom, no doubt for the extraction of the contents. Another of the same date (fifteenth century) is in the form of a toad, while a seventeenth-century specimen is in

the form of a Sussex pig, and was perhaps made at Rye. In size these medieval money-boxes are usually three or four inches high, and three to four inches in diameter. A larger example of somewhat later date, perhaps of the eighteenth century, which was found at Stepney, is between five and six inches high, and nearly four inches in diameter. This rather elaborate box has a globular body, resting on a pedestalled base, and is surmounted by a hen and three chickens.

At country fairs, in the less sophisticated days when fairs were fairs, no objects were commoner than children's money-boxes made in many forms of earthenware and china, often quaint and curious. In the remarkable collection of rural objects of use and ornament which Miss Gertrude Jekyll made through a series of years, and described in her delightful book on *Old West Surrey*—a collection since generously presented to the Surrey Archæological Society to be housed in their museum at Guildford—are two curious examples. One, made of coarse, yellow-and-brown splashed earthenware, has a round body on a stem or foot. It bears, rudely incised, the name Mary Smith, a figure of three trees, and the date 1837. Miss Jekyll suggests that 'it was not made for any special Mary Smith, but was a pattern to be sold at fairs, where so common a name would be likely to fit some one in a rustic crowd.' The other box is of oak, and was clearly intended to be of the puzzle variety. It is held together simply by the tight gripping of each edge of the six sides; but as 'one side is made slightly narrower than the others, and can be first released by the forcible pressing back of two of the projections,' it is probable that a youthful possessor would not be long in solving the puzzle. When the released side is put in again it is sprung into place by force.

The too familiar Christmas-box takes its name from the money-box or jar in which those who solicited or received the seasonable 'tips' were accustomed to store their plunder. A Latin dictionary-maker of 1585 defined '*capsella fictilis*' as 'a mony-box made of potter's clay, wherein boyes put their mony to keepe, such as they hang in shops on towards Christmas.' When Christmas arrived the box was broken and the contents shared. Bishop Hall moralised neatly on this retentive receptacle, when, in one of his theological works, he remarked that it was a 'shame for a rich Christian to be like a Christmas-box, that receives all, and nothing can be got out till it be broken in pieces.'

In the north of England and in Scotland, pots and vessels of various shapes, usually of earthenware, but occasionally of wood or tin, have been known for centuries, for some inscrutable reason, as 'pigs.' A 'pig' is a vessel which may be used for any and every purpose; and among its uses is that of a money-box. Some of the Scottish lads and lasses who take advantage of the new savings-bank device will probably be more apt to call their aids to thrift 'pigs' than boxes. When Jeannie, near the end of *The Heart of Midlothian*, presents her astonished husband with a parcel of bank-notes drawn from between the leaves of a Bible, secreted in a cracked brown can, with a piece of leather tied over the top, and so enables him to purchase a certain coveted piece of pasture-ground, she remarks that 'It wad be better laid out on yon bonny grass-holms than lying useless here in this auld pigg.' From revelations which are occasionally made, it would seem probable that this primitive method of banking—the storing of money in a carefully secreted box or jar—is still far from uncommon in country places.

SOME ANNALS OF A DESERTED DOCKYARD.

By C. M. Norris, Engineer Captain, R.N.

ANTIGUA DOCKYARD, better known locally as English Harbour, is situated on the south-west corner of Antigua, the chief of the British Leeward Islands.

The entrance to the harbour is through a narrow channel between two points lying east and west, on which are the remains of two old forts, Fort Charlotte on the east and Fort Berkeley on the west. The narrows open into a capacious anchorage called Freeman's Bay, from the northern end of which another channel leads into a close natural harbour, hurricane-proof as far as it is possible to obtain such a place on this terrestrial sphere.

On the eastern and northern sides of the harbour the ground rises abruptly to a height of some six hundred feet, known as Shirley Heights, on the summit of which may still be seen the remains of Fort Shirley and the barracks of the garrison which, during the French wars, was wont to keep a sharp lookout on the doings of our neighbours in the islands of Guadeloupe and Martinique to windward.

At the foot of these heights the older portion of the dockyard was built in 1721. On this side also we find the senior officer's house, now called by the colonists Clarence Cottage, probably from the fact that the Sailor-Prince, afterwards William the Fourth, lodged here when his ship was hove down for repairs. The cottage is still habitable, and is used by the colonists for picnics and other entertainments. On the western side, called the 'middle ground,' a tract of hilly country which separates the harbour from the adjacent Falmouth Harbour, the newer portion of the yard was built in 1743.

It consists of storehouses, commissioner's house, quarters for officers and men when their ships were careened, a capstan-house containing huge wooden capstans, and careening jetties or wharves against which the ships were hove down in order to make good underwater defects.

The yard, nestling amidst the well-wooded hills, is exceedingly picturesque; but it bore an evil reputation among the seamen of the past as a hotbed of yellow-fever. Shut in from the bracing influence of the trade-wind, and in close proximity to the water-tanks, it was a veritable mosquito-trap.

Captain Edward Thomson, in one of his *Sailor's Letters*, gives the following description of the place:

'ENGLISH HARBOUR, 21*st October* 1756.

'With the strictest truth I may call this one of the most infernal places on the face of the globe, though a commodious harbour for refitting. I have long been suffering from a white flux, and for recovery am stuffed into a small room with twenty-six people. I officiate as chaplain, and bury eight a morning. I attribute the fever to water taken from cisterns built by Admiral Knowles. It is all rain-water, and covered close up, which for want of air breeds poisonous animalculæ and becomes foul and putrid.'

As one gazes into this sleepy little hollow it is difficult to imagine it was once a hive of human activity; that the place once swarmed with the pigtailed seamen of Rodney, Hood, and Nelson as they hauled their battered ships in to make good the ravages of the enemy. We find here the immortal Nelson pouring out his soul in love-sick tones to his adored Fanny in the neighbouring island of Nevis. In yonder old cottage the hero of Trafalgar and the Sailor-Prince sat cheek by jowl discoursing the events of the last war, Rodney's action off Dominica, and the misdeeds of the colonists in evading the Navigation Act.

It was in 1784 that Nelson arrived at the harbour in the *Boreas*. As the vessel swung through the narrows and shot to her anchorage in Freeman's Bay, the first thing that caught the young captain's eye was a commodore's pennant flying from the masthead of the *Latona*. On making inquiries, he found that there was a standing order from the commander-in-chief, then on the Windward Division, that 'all captains refitting at the dockyard were to put themselves under the orders of the Resident Commissioner.' Now this officer, though twenty-one years Nelson's senior as a captain, was employed in a civilian position under the Navy Board. Nelson, now considering himself the senior naval officer present, sent an order to the *Latona* to strike the commissioner's pennant and return it into store. This done, he warped his ship into the dockyard and settled himself down as the senior officer on the Leeward Island Division.

In a letter to a local tradesman, which does not appear to have found a place in Nicolas's *Despatches*, he writes: 'As I mean to form a mess here for the hurricane-months, please forward one hogshead of port, one of best white wine, twelve dozen bottled porter, fifty pounds of sugar, one firkin of butter, two baskets of salt, and two pounds of black pepper.'

He had not been long in the place when he brought a hornet's nest about his ears. Before the Declaration of Independence the Americans had done a thriving trade with the colonists. When the peace came in 1783 the commerce was resumed, to the mutual satisfaction of both parties. Unfortunately, under the Navigation Act, foreigners were forbidden to trade with the British colonies. The Americans, having set up as a nation on their own account, were now discovered by Nelson to be foreigners within the meaning of the Act, and he with characteristic promptitude proceeded to deal with them as such. He therefore notified the Customs officials that he would seize any American vessel he found trading with the colonists. A correspondence now ensued between Nelson and Governor Shirley of the Leeward Islands, in which the latter was finally goaded into saying, 'Old governors are not accustomed to take advice from young gentlemen.' It was in reply to this that Nelson made the well-known retort: 'I am as old as the Prime Minister of England, and as capable of governing a ship of war as he is of governing the State.' The case was further complicated by the commander-in-chief sending the young captain orders to desist from extreme measures, and to be guided by the governor. In spite of these orders, Nelson, finding that his warning to the Customs officials had been disregarded, seized four American ships. The case was tried in the Vice-Admiralty Court, and the vessels and their cargoes awarded as prizes to the *Boreas*. The colonists now worked themselves into a state of excitement bordering on frenzy. After all that they had suffered during the war, here was a piratical youth come among them ruining their commerce, flouting their governor, and ignoring the orders of his admiral, apparently with no other object than to fill his pockets at their expense with his ill-gotten prize-money.

As the colonists were under the impression that a naval officer could not lawfully seize a vessel except through a deputation of colonial officers, they now caused the Yankee skippers to bring an action for damages against Nelson for assault and false imprisonment, and a warrant was issued for his arrest. But herein lay the difficulty. Though many were the ruses employed to gain possession of the body of the culprit, Nelson, by sticking close to his ship for

many weeks, managed to elude the vigilance of the provost-marshal, who followed him hot-foot from island to island in his futile endeavours to arrest him.

The matter was finally settled by the king, whom Nelson had memorialised on the subject, sending orders to Governor Shirley to have Captain Nelson defended at his expense. Later on came the thanks of the Treasury to the commander-in-chief for his successful efforts in the suppression of the illegal trading. When these were calmly appropriated by the admiral the indefatigable little captain's gorge rose. 'That another should be thanked for what I did, and against his orders!' he groaned.

Here is an extract from a letter to Mrs Nisbet about this period:

'ENGLISH HARBOUR, *August 14th*, 1786.

'My heart yearns to you, it is with you my mind dwells, absent from you I feel no pleasure. It is you, my dearest Fanny, who are everything to me; without you I care not for this world, for I have lately found nothing in it but vexation and trouble.

'I have not been able to get even a cottage upon a hill, notwithstanding my utmost endeavour; and therefore have been kept here most woefully pinched by mosquitoes, for my sins perhaps. So the generous inhabitants of Antigua think, I suppose, not one of whom has been here, or has asked me to leave English Harbour.'

In the midst of his activities, Nelson always took a keen interest in the welfare of his ship's company. He was beloved by all, particularly the midshipmen, whom he used to call his children. During the hurricane-months at English Harbour he encouraged music, dancing, and cudgelling on board, and the spirits of the men were kept up by plays acted by the younger officers. Amongst the latter an unfortunate affair took place which cast a gloom over the ship's company for a time. Two of the midshipmen, Mr Andrews and Mr Stainsbury, fought a duel which nearly terminated fatally for the former. The young officer eventually recovered, and lived to fight his country's battles in the next war.

Duels frequently took place in English Harbour, among both the naval and the military officers. They were generally fought on the middle ground toward the shore of Falmouth Harbour. A story of a somewhat sanguinary encounter is related by Admiral James (one of Rodney's officers) in his journal: 'A quarrel took place between myself and Mr Dick, the surgeon's mate, to be settled on our arrival in English Harbour. We went on shore on October 22, 1771. Not being able to procure pistols, we fought with our hangers till each was so disabled by cuts that it was mutually agreed we should defer final settlement of dispute until we were able to procure pistols. On our arrival on board, however, we were put under arrest and kept there until an amicable settlement was arrived at.'

It was in 1781 that Prince William Henry arrived in the harbour in the *Pegasus* and put himself under the orders of Captain Nelson. They had met before at Jamaica, but a warm and intimate friendship now sprang up between them, and Nelson found a ready listener when he let himself go on the charms of his dearest Fanny, and the prince amicably insisted on giving the bride away. For the next six months the two officers dined together on alternate nights, and Nelson found himself in attendance on the prince at a constant succession of dinner-parties, balls, cock-fights, dignity-balls, and other entertainments which the generous planters have always been accustomed to lavish on the naval officers of their day. The genial, unconventional manners of the prince won the hearts of the Antiguans, and they vied with each other in their efforts to make his stay a pleasant one; even the negroes were charmed with the 'Grand Buccra,' as they called him. But the effect of the prince on Mr John Burke, Solicitor-General, seems to have been rather alarming. That gentleman had been deputed by the Legislative Council to read an address of welcome; but, according to a local record, 'he was so completely dumfoundered that he was unable to articulate a single word.'

Though the most amiable of men on shore, the prince was somewhat of a martinet on board ship; even the loyal Nelson remarked in one of his letters that the prince 'had more trouble than enough with his officers.' A good instance of his methods is shown in the following extract from his order-book:

'*Pegasus*, ENGLISH HARBOUR,
'*23rd January* 1787.

'From Mr Schomberg's neglecting to inform me yesterday of his sending a boat on shore, and Mr Smollet doing the same, I think proper to recommend the reading over of these orders with attention to the officers and gentlemen, as for the future I shall make them accountable for their conduct in disobeying any commands or orders I may from time to time give out.

'WILLIAM.'

Mr Schomberg, who was first lieutenant to the prince, once told the latter that 'no officer could serve under him, as sooner or later he must be broke.' He took the censure in the order-book so much to heart that he applied for a court-martial on his conduct. As there were not sufficient officers in the harbour to form a court, Nelson put him under arrest to keep him out of harm's way; and so the luckless officer remained till the arrival of the *Pegasus* at Jamaica six months later, when the matter was settled out of court. He was not 'broke,' but eventually became a Commissioner of the Navy. He was the author of *Schomberg's Naval Chronology*.

In the spring of 1787 the *Boreas* and *Pegasus* went for a cruise round the islands, during which they touched at Nevis, where the prince performed his crowning act of kindness by giving the bride away and making Nelson the 'happiest of men.' In May the two friends parted, Nelson going back to English Harbour to refit for the voyage home, the prince to Jamaica and afterwards to North America, where he was ordered to pass the winter. The latter part of the programme was more than he could stand, so in direct disobedience of orders he made the winter passage from Halifax, struck a gale of wind off the Scillies, and arrived in Plymouth about the end of December with his sails torn to shreds.

This little escapade of the prince caused somewhat of a flutter at the Admiralty; and as my Lords did not see their way to try a prince of the blood by court-martial for an act to the prejudice of good order and naval discipline, they decided to leave the matter in the hands of the king, who ordered that the culprit should be confined to the precincts of the port of Plymouth until his ship had completed her refit, and then be packed off to sea again. There is no reason to suppose that the prince found the time hang very heavily on his hands, for he was cheered in his confinement by a visit from the First Gentleman in Europe, who journeyed down to Plymouth with a few choice spirits to welcome his erring brother.

On 13th January 1797 an incident occurred in Antigua which bulks largely in the annals of the yard. On the evening of the day in question the sloop *Perdrix* was lying against the jetty in front of the capstan-house on the eastern side of the yard. She was commanded by Lieutenant Peterson in the absence of his captain on leave; the sloop *Favorite* was at the opposite side of the yard, commanded by Lieutenant and Commander Lord Camelford. The alarm guns having been fired from Shirley Heights, Camelford sent an order to Peterson to row guard and prepare to act with the military in manning the forts at the entrance to the harbour. Peterson, conceiving himself to be the senior officer of the two, sent a reply saying that he 'wondered at Camelford's presumption,' and subsequently sent a counter-order, signing himself senior officer at English Harbour.

Camelford replied by sending Lieutenant Millward with a party of marines to arrest Peterson and bring him, dead or alive, to the western capstan-house.

Lieutenant Millward's evidence before the court-martial which ensued is as follows: 'Having arrived at the stairs leading to the mess-room over the capstan-house, I found it guarded by two seamen with fixed bayonets. Having obtained permission, I went up, followed by the marines. I found Lieutenant Peterson sitting there, and when I told him I had come to arrest him, he grew very violent, jumped up, seized his sword and a brace of pistols, and told me if I did not go he would run me through. As I advanced he made a thrust at me, which I parried with my sword. I then ordered the marines to seize him; but finding I could not arrest him without danger to his life, I called the marines off. He then told the master to arm himself, and going to the window, shouted, "*Perdrix! Perdrix!* Arm yourselves!" Just then I heard Lord Camelford, who was at the foot of the stairs, calling me to come down, which I did. Lord Camelford then went to the wharf and hailed the *Favorite* to come to his assistance. By this time the *Perdrix* men were falling in on the jetty, with their arms, and Lieutenant Peterson was walking in front of them with his sword drawn. It was then quite dark. Lord Camelford then took one of my pistols and asked if it was loaded. On being told it was, he advanced and asked if Mr Peterson was there. The latter replied, "Here I am, damme, sir!" Lord Camelford said, "Do you still persist in disobeying my orders?" "I do," was the reply. Lord Camelford then raised his pistol and shot Lieutenant Peterson dead. Then turning to the ship's company, he said they were quite right in obeying their officer, but that he had shot Lieutenant Peterson for mutiny.'

Lord Camelford was tried for his act on board the flag-ship at Martinique, and honourably acquitted.

In connection with this extraordinary verdict, it is an open question whether Lord Camelford was not himself the mutineer. Lieutenant Peterson was some two years the senior as a lieutenant; and, under the naval law as it exists to-day, an officer placed under similar circumstances would be the senior officer present. The court appears to have accepted Camelford's statement that he was the senior officer, and the Admiralty were only too glad to have the matter hushed up and done with.

Although English Harbour was not finally closed down till about 1880, its sphere of usefulness gradually declined after the American war of 1812.

With the gradual lengthening of the old wooden walls, and later on the introduction of the steam fleet and the substitution of dry-docks for the old-time method of careening, the centre of naval activity was moved northward to Bermuda, which has for many years been practically the only refitting station for ships on the North American and West Indies station. English Harbour is the only existing dockyard which has not to some extent kept pace with the times. It still remains an object-lesson in dockyard methods of 1800 and war-time, when much was accomplished with small means.

FAMOUS WRECKWOOD FIRES.

By Thomas Hake.

THE wreckage cast from time to time upon our storm-ridden shores can never fail to awaken a romantic interest. To the fisherfolk and such-like dwellers within sound of the sea it must frequently convey a meaning too sad to contemplate; but, on the other hand, the briny logs of broken timber 'arrive' after a gale in the shape of fuel that is greatly prized, being often found littering the very threshold of weather-beaten homes. Such fuel may chance to be reminiscent of disaster and even loss of life; but, nevertheless, it helps to brighten the domestic hearth. The peculiarly witching light of a wreckwood fire, with its delicate display of rose-tinted flames blending with tints of green and blue, seizes upon the fancy; and to him who sits beside it at the midnight hour, conscious of a storm raging without, there must occasionally come visions as weird as the one which haunted the mind of Clarence in *Richard III.*:

> Methought I saw a thousand fearful wrecks,
> A thousand men that fishes gnaw'd upon,
> Wedges of gold, great anchors, heaps of pearl—
> . . . . . .
> All scatter'd in the bottom of the sea.

But a wreckwood fire alight upon the seashore after a tempestuous night, with the breakers sounding loudly in the ear, is even more inspiring. A scene of waste and desolation it is, no doubt, symbolising man's unequal fight with the forces of Nature; and yet it is so picturesque that the fascination it asserts is scarcely less irresistible than the sense of consternation and awe.

It was upon just such a wreck-strewn beach that one of the most memorable of wreckwood fires was kindled some ninety years ago. The afternoon had been stormy, with violent winds from the south-west. Evening closed in, and with the approach of night a thunderstorm broke over the Mediterranean shores such as brought a sense of dread even to the stout-hearted seamen of those latitudes—seamen well accustomed to witness the appalling 'liquid pillars of fire' never experienced in more northern climes. Just before the coming of that fateful storm, Shelley and his friend Williams, accompanied by one sailor, a man named Vivian, had gone towards Spezia from Leghorn on a return cruise. Their boat was caught in a sudden squall; it went down stern foremost, not giving them a moment in which to turn round and confront their perilous plight. Some days later Shelley's body was washed ashore in the lovely Bay of Spezia, as Trelawny was the first to discover. He it was who obtained the needful permission to reduce the remains to ashes by fire. It was the only means by which the wishes of the poet's friends for the burial at Rome could be carried out. It was all arranged in accordance with the Tuscan law: any object cast ashore must be burned, as a precaution against plague. 'We found,' says Trelawny in his graphic narrative of the event, 'wood in abundance—parts of wrecks cast upon the beach.' The place was about four miles from Via Reggio. The headland, projecting boldly and far into the sea, forms a deep and dangerous gulf, with a heavy swell and a strong current generally running right into it. A vessel embayed in the gulf and overtaken by one of the squalls so common upon that coast is almost certain to be lost. It was here, near the spot where the body had been found, that a portable furnace and tent were prepared. The furnace was of iron bars and strong sheet-iron; and the fuel used was wreckwood, with frankincense, wine, salt, and oil, the accompaniments of a Grecian cremation. This revival of a classic rite was performed in the presence of Byron, Trelawny, Leigh Hunt, and a guard of soldiers. The copy of Keats's last volume found in Shelley's pocket, doubled back at the 'Eve of St. Agnes,' as though he had been reading it until forced by the squall to put it aside, was thrown upon the blazing pyre. The extraordinary beauty of the flames was very noticeable; and a curlew that came wheeling and screaming round and round, close to those flames that rose golden and towering into the night, could not be driven away.

In that weird and powerful romance, *The Toilers of the Sea*, Victor Hugo has related the most amazing episode connected with a wreckwood fire ever imagined. It occurs in that part of the story in which the titanic hero, Gilliatt, having reached his destination on a solitary sea-bound and sea-beaten rocky peak, makes all the necessary preparations for carrying out, with fierce and dogged resolve, his set task—the herculean task of reconstructing a wrecked vessel, a steamboat fixed as in a vice between two perpendicular rocks known as the Douvres, off the treacherous coast of Guernsey. With no human aid—no resource beyond his own vigorous brain and brawny arms—he ultimately achieved his purpose. For art he had instinct; for power, will. He possessed a hatchet, a chisel, and a hammer. He wanted a good workshop and a convenient shed. He began to busy himself among the breakers in search of wreckwood, collecting more especially the smaller parts of the wrecked vessel. He took advantage of every high tide to strip the reefs of everything that the shipwreck had scattered upon them. He went from rock to rock seizing upon splinters of panels, shattered planking—whatever the riotous waves had dis-

persed. During these clambers over the rocks in search of the needed wreckwood and every scrap of iron that he could lay his hands on, he kept a sharp lookout for caves; he found two at last that proved appropriate for the purpose he had in view. He decided that one should serve as a storehouse for the wreckwood; the other he resolved to convert into a blacksmith's forge. At the entrance to the storehouse he always kept two heaps: a pile of iron for forging purposes, and a pile of wreckwood for fuel with which to feed unceasingly the contemplated forge-fire. Through the rocky recess he had chosen in which to construct his forge there was a never-ceasing current of air. This he resolved to utilise. It was this draught that suggested to him the notion to transform the cavern into a smithy. The draught, however, had to be regulated. With amazing ingenuity he stopped up all the crevices of the rock with paste and tow, leaving only a small air-passage made out of a powder-flask which he had found on board the wreck. This flask he directed horizontally towards a large stone, which Gilliatt made the hearth of his forge. Having heaped wreckwood upon his extemporised hearth, he lighted his forge-fire. The cave being partially open to the sky, the smoke issued forth freely, but it blackened the escarpment; the rocks which had seemed destined for ever to receive only white foam and crystalline spray became polluted with black smoke from the wreckwood fire. As if to enhance the wonderful vitality and picturesqueness of the scene, the wild sea-birds flying to and fro watched him as he worked. For fuel, then, he had wreckwood, the wind was his bellows, his anvil a stone. As he had no cooking utensils in which to boil the crabs which were almost his only food, he baked them in the forge-fire between two stones after the fashion of savages. But these wreckwood fires which he kindled were hardly sufficient to warm him; for in that open space, with the wind blowing in from the sea, he was often half-frozen on one side and half-scorched on the other. Seated there, wrapped in his sheepskin cloak and supping off baked shell-fish, how mystical must have been the meditations of that solitary toiler of the sea as he gazed into his wreckwood fire, with no sounds but the cries of the sea-gulls circling overhead and the roar of the waves breaking upon the rocks at his feet! It was while in search of wreckwood for this forge-fire that Gilliatt chanced to discover the strange and fairy-like cavern which is so vividly portrayed—the splendid home of the loathsome devil-fish, or eagle-ray, of which this amazing hero of romance so nearly became a victim.

But the most delightful picture of a seaside wreckwood fire is to be found in *Twice-Told Tales*. It has all the fancy and all the charm of Hawthorne at his best. It reads like a page out of his own reminiscences, as indeed it must have been, for it is descriptive of one of those lonely wanderings which he appreciated more than most men. On the shore where he is strolling in a quaintly objective, and yet reflective, mood, a fishing party have landed from their skiff and are cooking their scaly prey by a fire of wreckwood kindled in the angle of two rude rocks. In the deepening twilight, while the surf is dashing near their hearth, the ruddy gleam of the fire throws a strange air of comfort over the cove, bestrewn as it is with pebbles and seaweed, and exposed to the 'melancholy main.' Moreover, as the smoke climbs up the precipice it brings with it a savoury smell from a pan of fried fish and a black kettle of chowder. 'This reminds me,' Hawthorne confesses, 'that my dinner was nothing but bread and water and a tuft of samphire and an apple. . . . Methinks,' he goes on to soliloquise, 'the party might find room for another guest at that flat rock which serves them as a table; and if spoons be scarce I could pick up a clam-shell on the beach. . . . They see me now! and one of them sends up a hospitable shout. Can I decline? No; and be it owned, this is the sweetest moment of a day by the sea-shore.'

Even the Ancient Mariner—the mariner

> Whose eye is bright,
> Whose beard with age is hoar—

might have been tempted to approach such a genial wreckwood fire—tempted to spin his yarn of the spectre-bark once more.

THE MONTH: SCIENCE AND ARTS.

A NOVEL SUCTION-CLEANER FOR THE HOME.

THE widespread popularity of the vacuum system of cleaning furniture, carpets, decorative fabrics, and bedding has resulted in commendable ingenuity being displayed by inventive minds in the evolution of a compact and handy little apparatus for domestic use. Probably the acme of simplicity, efficiency, and utility has been attained in the 'magic' suction-cleaner which has recently made its appearance. This device, which is British throughout, indicates a new development in the system of removing 'matter in the wrong place,' as the scientific description of dust and dirt has it. The cleaner comprises an outer case of aluminium which contains four essential parts—namely, the suction intake, fan-box, motor, and exhaust duct respectively. The electric motor is built specially to avoid excessive heating, and is

made so as to withstand long, hard use, and sufficiently powerful to do more work than it is ever likely to be called upon to perform. It is mounted horizontally, and is fitted with special, easily accessible reservoir oil-mechanisms which lead to all bearings. There is a turbine disc-fan attached directly to the armature of the motor, which is driven at just the right speed to secure the proper balance of draught. This suction effort is constant and steady in very large volume. The case is mounted upon rubber-tired wheels fitted with ball bearings, so that only the minimum of effort is required to push the cleaner to and fro. The motor can be driven from the house supply of electricity; all that is necessary is to attach a plug to a wall connection or to the lampholder of one of the electric lights. As this appliance is intended to supplant the unsatisfactory broom, lightness has been a consideration, and its total weight is no more than ten pounds. The principle upon which the cleaner works is very simple. The fan, rotated at a high speed, exercises a powerful suction, drawing the air through the fabric over which it is being passed into a suction inlet, and then discharging the dust into a bag made of dust-proof fabric attached to the lower part of the handle; when filled the bag is easily removed and emptied. The action of the suction draught, however, is different from that of the ordinary vacuum cleaner. It does not tear the fabric to pieces, which is one of the greatest objections to this system of cleaning, but merely removes the loose dirt and dust. When delicate decorative fabrics and hangings are being submitted to such treatment this is a vital consideration. The ordinary vacuum system disintegrates the threads of the material owing to the force of the suction draught, and for this reason many people after one experience of vacuum cleaning revert to the old-fashioned method, which, although it possesses many drawbacks, at the same time has the overwhelming advantage of not injuring the fabric in the slightest. With the 'magic' cleaner no such defects are present. It will clean my lady's delicate velvet hat and fragile plumes as easily, safely, and completely as it will cleanse a dust-laden carpet. The control is extremely simple, there being a switch in the handle by means of which the apparatus is moved to and fro. Moreover, it is utilitarian to the utmost degree. There is a variety of attachments whereby it can be used for many different purposes, such as cleaning upholstered furniture, renovating pillows by driving a powerful blast of pure air through the feathers (thereby separating them), dusting walls (for which purpose the attachment is fitted with bristles like a brush), curtains, carved furniture, mattresses, quilts, and bedding, hats without inflicting the slightest injury, picture-frames, mouldings, cornices, &c., books by driving a current of fresh air between the leaves, drying the hair after shampooing—in short, for every purpose where the removal of dust or damp is imperative to ensure cleanliness and health.

MEASURING THE DENSITY OF SMOKE.

The position of the societies for bringing about an abatement of the smoke nuisance has been strengthened very materially by the perfection of an instrument whereby it is possible to measure the density of smoke. This apparatus has been devised by Mr Joseph Lovibond, F.R.Met.Soc., and is a modification of his well-known tintometer. The appliance consists of a short optical instrument having two apertures at the objective end. One of these orifices commands a view of the smoke under examination, while the other gives a view of the surrounding daylight, taken from a projecting reflector. The eyepiece of the instrument secures a view of both, side by side. The daylight aperture is then closed by a series of standardised glass absorbents, until the light in the daylight aperture is equal in luminous intensity to that of the smoke. The smoke density obtained is recorded as so many units of light obstructed, and the value of the unit is recorded upon the top of the instrument, showing the result without further calculation. The basis of the light-unit is in accord with Professor Rood's division of the diffraction spectrum into five spaces of twenty units each. The value of a given light is determined by the number of neutral tint-units required to absorb all the spectrum colours.

OILSKIN WATERPROOF CLOTHING.

To decide concerning the class of clothing for wet-weather wear is always difficult. There are innumerable classes of such material upon the market, ranging from the tweed dressed with a water-resisting medium which is purely temporary in its protective qualities, to the ungainly oilskin. From all points of view the latter article is far and away the most efficient, but an objection has been raised to its sticky character and nauseating aroma. These drawbacks have been so great that, despite the undisputed value of such an article, it has been rejected in favour of the less satisfactory but more pleasant mackintosh material. The latter, except in the very highest-priced qualities, is of little use. Its life, so far as resisting rain is concerned, is very brief; while even the best qualities, acting somewhat as a sponge, become saturated with the rain, and are then uncomfortably heavy and hot. During the past few years further attention has been devoted to the oilskin waterproof with a view to eliminating its defects, and in this direction complete success has been achieved. No matter how wet the surface may become, there is no possibility of the slightest stickiness developing, while the fabric is absolutely free from smell. It has also been possible to prepare the oilskin in a variety of weights, so as to adapt the

garment made thereof to any desired purpose, either for ladies or gentlemen. Complete protection against the weather can be secured with a coat as light as silk or as heavy as a navigator's serviceable sou'-wester. Coats can be made to meet the exigencies of city life, riding, driving, motoring, and any other outdoor occupation, with equal success. Seeing that the oilskin is the obvious means of preventing the rain from penetrating to the under-garments, and that great advances have been made in its preparation, it should enjoy a great measure of popularity. In the Colonies it should make a special appeal, especially in such as Canada, where the rainfall is torrential in its severity, as the writer knows from experience, and will penetrate any other class of water-resisting material in a few minutes. The 'slicker' is about the most efficient waterproof garment available in the Dominion; but its sticky surface makes against its popularity, although its vogue is extensive, for the simple reason that there is no competitor affording equal results. The 'beacon oilskin,' however, is as superior to the old-fashioned 'slicker' as the modern railway express is in advance of Stephenson's 'Rocket.' Ladies particularly should welcome this new fabric because of the fact that it is made in a wide range of colours, which renders it more attractive to the fair sex.

WONDERS OF KINEMATOGRAPHY.

Although the popular impression of the value of kinematography is that it is for amusement only, recent developments have served to show that it is capable of being pressed into sterner service in the interests of science. M. Lucien Bull has devised an apparatus whereby it is possible to photograph bees, flies, and beetles on the wing at the rate of two thousand pictures per second, so that one may study at ease the complex movements of the wings of such creatures, which otherwise, owing to the remarkable rapidity with which they move, cannot be followed by the naked eye. He has also taken a series of photographs showing a bullet being fired through a soap-bubble. When projected upon the screen in a large image the bullet appears as big as a football, while the bubble resembles a huge balloon. The flight of the bullet can be easily followed, and the picture is intensely fascinating, inasmuch as it is observed that the bubble does not burst when the bullet penetrates the exceedingly thin and fragile wall, but when it emerges from the opposite side. A German experimenter has followed up M. Bull's experiments, and has devised an apparatus capable of taking a photograph in one ten-millionth part of a second. Of course, for such a brief period of exposure sunlight is useless, so the electric spark, which is exceedingly rich in rays having a highly valuable photographic quality, is used. The apparatus is employed primarily for military purposes, such as photographing projectiles in flight for the study of ballistic problems and the operation of automatic firearms. Although the pictures are taken at the speed of over two hundred and fifty per second, when they are projected upon the screen at the rate of sixteen pictures per second—the average speed in projecting moving pictures—the flight of the projectile to its emergence from the muzzle may be followed as easily as a man running down a street. Dr Carvalho has pressed the X-rays into service in conjunction with the kinematograph, and one can now see upon the screen the working of the various parts of the stomach during the digestion of a meal. Recently an Austrian engineer has completed an apparatus by means of which the movement of a steam-hammer has been photographed. This has been carried out in order to secure more reliable data in connection with the technical investigation of steam-hammers than any other known means can afford. It would seem, therefore, that moving pictures will in the future become an invaluable aid in scientific research, particularly as the applications of the kinematograph are illimitable.

A TRAVELLING THEATRE ON MOTOR-CARS.

In this country the peripatetic showman has become almost a thing of the past; but it would appear as if there were a possibility of his revival if an experiment which is now in progress in France becomes commercially successful. An enterprising theatrical manager in that country has conceived a novel means of treating the provincial population to the best productions of the Paris stage. He has abandoned the horse-drawn caravans in favour of an elaborate motor-car equipment composed of no less than ten powerful tractors and thirty-six cars for scenery, wardrobe, tent, and company. The outfit is divided into ten trains, and these tour from town to town in the showman's customary manner. The whole of the equipment is in duplicate, so that while the final performance in one place is drawing to a close the second installation can be moved on to the next, and the erection of the theatre for that place can be commenced while the other is being dismantled. In addition to the tent proper and the seating for the auditorium, two cars are equipped as boxes, two to each car. These are fitted in the most luxurious manner, and would do justice to a city theatre. They are drawn up on either side of the proscenium. The manager's office is situated in one car, while other cars are set aside for dressing-rooms. The tent accommodates about sixteen hundred people, while the stage is twenty-three feet in width by thirty-three feet deep. The erection of the tent, which is of solid and massive design, occupies about fifteen hours. The equipment includes a complete electric generating station for supplying current to thirteen hundred lamps on the stage

and two thousand in the theatre itself, while the train is completed with one car set aside as a workshop for carrying out all repairs.

BEET-SUGAR RAISING IN BRITAIN.

During the past few months additional impetus has been given to the movement in favour of establishing firmly the beet-sugar industry in Britain. The upward tendency in the price of sugar during the present year is said to augur well for the industry in this country, and the wonderful results which have attended its exploitation on the Continent are held up as an example of what can be accomplished in this direction. Britain imports about one and a half million tons of beet-sugar annually, the value of which is about twenty millions sterling. On the face of it, therefore, it certainly appears as if there were a profitable outlook in this field for our farmers, especially when it is stated that the British soil and climate are adapted to the cultivation of the root. The one great objection, however, to the project is the high cost of labour in this country as compared with the Continent. Then, again, it is admitted that the crops require unremitting attention to bring about the best results. Seeing that to-day the great difficulty in Great Britain is to keep the men on the land, this appears to be an insuperable obstacle. Moreover, there is very little land in these islands suited to the beetroot which is not already under cultivation for some other crop; and the question naturally arises in the farmer's mind as to whether it is better for him to abandon the present system, the precise return from which he knows, in favour of another crop the financial results of which are doubtful. Statistics concerning cost of production and profits obtained in Continental centres are advanced, but they cannot be accepted as conclusive evidence of what could be done in Britain. The strongest competitor is the cane-sugar, which is likely to improve as years go on, for improved processes and methods are being practised by the planters. It is advocated that a change in our fiscal system would bring about the desired results. Such may be the case so far as it affects this country; but, at the same time, the profits of the Continental factories would shrink to a low ebb. Even if such a situation were produced, it is doubtful whether beet cultivation and sugar manufacture would ever assume very large proportions in these islands, owing to economic reasons, for one can hardly expect the farmer to change at once, say, from grain-growing to beetroot-cultivation. For instance, France, which is the model agricultural country to the world, produces about eight hundred thousand tons of beet-sugar per annum, whereas Germany has an output exceeding two million tons. One would have thought, from the fact that France grows sufficient grain to render itself self-supporting, being equal in volume to twice that grown in Canada, that the French would have occupied the premier position in this industry. Evidently the French farmer does not consider the proposition so attractive as to induce him to throw himself whole-heartedly into beet-cultivation. Denmark has now seven beet-sugar factories, and others are being organised. Although the cane-sugar planters in the West Indies have not advanced so rapidly with their improved processes as was foreshadowed, yet the waste from the 20 per cent. of sugar in the cane is being reduced more and more. The Continental companies attained their present position solely through the iniquitous bounty system. When the sugar-cane industry of the West Indies regains its footing history probably will be repeated, for when heavy shipments were made from them to the Continent the beet-sugar industry seemed likely to collapse, as it could not withstand its competitor. The West India planters are overhauling their fields, systems, and processes, and up-to-date machinery is being introduced. A paper on 'English Beet-Sugar,' by a well-known authority, Mr Sigmund Stein, of 214 Upper Parliament Street, Liverpool, was published in these columns in 1910. In the same volume a paper appeared by Mr C. M. Hale on 'The Decay of the Sugar Industry.'

THREE-WHEELED MOTOR-CARS.

The latest development in the automobile industry has created a favourable impression. The recent Motor-Cycle Show introduced the public to the three-wheeled vehicle, which is neither a motor-car nor a motor-cycle. It is a hybrid, but one which is destined to a great future. The 'auto-carrier' in general appearance resembles the familiar voiturette, and affords all the comfort and convenience of that little vehicle, with a host of other attractions in addition. The air-cooled engine develops about six horse-power, and is fitted with two large outside flywheels which ensure steady running and flexibility. The power is transmitted to a simple special two-speed epicyclic gear of strong design, mounted on the back axle through a single chain, and giving a maximum speed of forty miles per hour. The control is of the simplest character. It will be seen that the power equipment is similar to that of a motor-cycle. The third wheel is placed behind. The body of the voiturette, designed to seat two, is the ideal of comfort, being complete with wind-screen and collapsible hood. This ingenious vehicle has certainly solved the problem of company on a motor-cycle, with none of the disadvantages and perils of a side-car attachment, for it moves as steadily as a car. Those who wrestled with the power-driven tricar may regard this latest development merely as a glorified modernised vehicle of that type, but such is not the case. The three-wheeled automobile as exemplified by the 'auto-carrier' stands in a class

by itself, and that its many features were realised the interest it aroused at the Motor-Cycle Show proved conclusively. The motor runabout has almost disappeared from the roads for the simple reason that it was too costly to purchase, and the cost of maintenance and wear and tear were so heavy. The 'auto-carrier,' on the other hand, costs no more to run than a motor-cycle, and at the same time gives everything that the small runabout motor-car can offer. It also solves the problem of a low priced automobile, inasmuch as, complete, it costs less than one hundred pounds.

BIG FORTUNES IN LITTLE INVENTIONS.

Mr W. A. Du Puy, a writer in the *Scientific American*, points out how many fortunes have been made from little, useful everyday inventions. Mr W. H. Palmer of Baltimore was the inventor of a cap for beer or soda-water bottles which has made him a millionaire. He carried the patent in his pocket for six years before he succeeded in placing it on the market; when it was placed Palmer and his capitalist had a profit of many thousands of pounds between them on the first year's business. The difference between the old straight and the crinkly hair-pin made a fortune for an inventor, who took his cue from his wife's difficulty in the use of the article. Thaddeus Fairbanks was a New England farmer who, in the silent watches of the night, thought out the principle of the now well-known Fairbanks scales. The rubber eraser on the end of a pencil made a fortune for its introducer, H. L. Lipman of Philadelphia; while Heatin of Providence, who devised the little metal staple that holds on shoe-buttons, realised a fortune thereby. Elias Howe evolved the sewing-machine from the idea of placing a hole near the point of a needle; others followed, and brought the machine still nearer perfection. Adams, who brought out a patent in 1871 for chewing-gum, made a great fortune from it. The man who invented an opener for tins did well, as also the inventive genius who made a can with a seam just below the top which, when the owner wants to open the tin, he has but to strike, when the seam breaks and the top comes off. A Chicago packer ordered ten millions of these cans as an experiment, and others followed suit. Quite as interesting a list might be compiled of British inventors on similar lines. The matter is suggestive as well as encouraging. Mr Du Puy reckons that half of the patents taken out are of public value, many of them of really stupendous worth.

THE ELIMINATION OF THE KITCHEN.

In the Brent Garden Village at Finchley, houses are being built with a view to abolishing, as far as possible, domestic drudgery, and they are without a kitchen. The aim of the promoters of the village scheme is to induce the tenants to take their meals in the central hall, and for this purpose the old mansion on the estate, once occupied by the late Baroness Burdett-Coutts, has been turned into a kind of hotel, with a staff of servants. These servants will be available for engagement by the hour or day for service in the houses of those resident on the estate. Self-contained houses and flats are to be built, the former at rentals, exclusive of taxes, of thirty-two to seventy pounds a year; the latter from twenty-eight to fifty-five pounds, inclusive of rates and taxes. Mr J. W. C. Haldane, C.E., in his latest book, *Married Life Variously Considered*, draws attention to other methods of getting over the servant difficulty by living in flats or maisonettes, such as Queen Anne's Mansions, Westminster, London. This great edifice, of many stories high, containing one thousand rooms, stands on the borders of St James's Park. Here the residents can have any number of rooms, from one upwards, on long or short leases, and may have their meals either at home or in the residential dining-rooms of the building. The kitchen is eliminated, and the skilled domestics of the company are employed. At Ruislip Manor Estate, near Harrow-on-the-Hill, there is also a system of co-operative housekeeping. Meals may be either prepared at home or supplied in a central building, and trained servants are furnished by the hour or the day.

To Correspondents who wish fuller information regarding new inventions mentioned here, addresses will be furnished, when possible, provided a stamped and addressed envelope or post-card be sent to the Editor, 339 High Street, Edinburgh.

A PASSING CLOUD.

I saw a cloud, with fiery edge of storm,
Pois'd above earth and all its hives of men;
And then I said, 'A tempest comes again.'
And I beheld in mind the lightning's form,
I saw the great black drops that fell transform
The peaceful landscape with a look no pen
Could picture in its dread and surge; but then,
Behold the edges of the fearful cloud
Grew silvern and golden, and a spray
Of lovely light shot out where once it lay
Like spangled lace around a funeral shroud;
And, lo! I learn'd the lesson, known of old,
That threatening dangers may be angel-guides,
Unseen, yet treading where our terror glides.

WILLIAM J. GALLAGHER.

*** TO CONTRIBUTORS.

1*st*. All communications should be addressed 'To the Editor, 339 High Street, Edinburgh.'

2*nd*. For its return in case of ineligibility, postage-stamps should accompany every manuscript.

3*rd*. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, *should have the writer's Name and Address written upon them* IN FULL.

4*th*. Poetical contributions should invariably be accompanied by a stamped and directed envelope.

MA'MSELLE.

A STORY OF THE GREAT WAR-TIME.

By H. F. ABELL.

IN FOUR CHAPTERS.—CHAPTER I.

EVERYBODY in Milton loved Ma'mselle, and everybody called her a fool. They loved her because, although a stranger in the land, and a French stranger at a time—that is, in the year 1813—when the hatred of Frenchmen by Britons was of an intensity not to be realised in these days of *entente cordiale*, she gave up her life to the doing of good works not only among the poor inmates of the great war-prison at Staple Cross, near Milton, but among the country dwellers around.

They called her a fool because she had refused the hand of John Bungay, the 'Dandy Squire,' a man of fine presence and of ample means, for favour from whom half the eligible damsels for miles around would have made no slight sacrifices.

Some months before the opening of our story John Bungay had travelled down with her in the coach from London, and had rendered her some trifling service which had led to conversation, from which he learned that she, a lone and beautiful girl, was coming to Milton, in the very heart of France-hating England, to carry out a mission of mercy among her miserable fellow-countrymen shut up in the great war-prison, and treated as detestable criminals for no other reason than that they had dared to act as instruments for the great European Ogre who would rule the world. To the mind of the bluff, narrow-minded English countryman there was something so charmingly original and romantic in the idea that this fair, and evidently well-born and well-to-do, young Frenchwoman should consecrate her life to such a work as the humanising and caring for the wants of a crowd of men whom he, like everybody else, deemed worthless rascals, that she had won from him what he had never been known to give to a woman before—his affection.

John Bungay was somewhat of a mystery. He had appeared at Milton some six years previously, no one knew for certain whence; and although he evidently carried on a business of some sort, as he had a large correspondence and talked of his 'office,' its nature was never revealed, and he seemed chiefly occupied with the gardens he had made out of the land which ran along the great western road from Milton village to opposite where the great war-prison reared its unsightly walls.

Ma'mselle had upon arrival taken a room at the 'Bell' in Milton, a famous old inn whereat some score of mail-coaches changed horses every day of the year, and the next morning had called upon Captain Heacham, the governor of the war-prison, had told him her errand, had produced credentials which proved her connection with some of the best families of old aristocratic France, and finally had received his permission to commence her rôle of ministering angel among the six thousand inmates of Staple Cross. But not without difficulty. The numerous escapes of prisoners—and especially of notable prisoners—of late had rendered the most rigid precautions necessary; and even Captain Heacham, impressed as he evidently was by the beauty and pathetic earnestness of his applicant, only granted her prayer under conditions which made it practically impossible for her to aid and abet in any attempt at escape on the part of her protégés.

But the influence of Ma'mselle in the neighbourhood became something more than that of a mere philanthropist. Finding that being in Milton village necessitated a long daily walk of more than a mile to the prison at Staple Cross, and, what was of more weight, that proximity to Mr Bungay exposed her to more of that gentleman's attentions than were agreeable, she took a bold step.

It was an age when the rigid education of young ladies was regarded as a sort of compensation for the anything but rigid manners and morals of young men, and particularly rigid was the scholastic establishment at Parthenon House—in the village of Paxley, within a stone's-throw of the war-prison — over which Miss Wimple held sway.

Ma'mselle had often been impressed by the crushed and unnaturally sedate appearance of the Parthenon House young ladies when she met them taking their constitutional walk under the eye of a severe-looking governess, and a field for

 [*All Rights Reserved.*]

further exertion on her part seemed to reveal itself. She called on Miss Wimple.

Miss Wimple was a prim, precisely dressed, perfectly drilled little lady of fifty, upon whose every action and gesture was printed the word 'propriety,' and the contrast between her and the tall, well-built, fair-haired, blue-eyed, well-dressed French girl, whose every gesture and movement was natural and easy, was almost ludicrous.

'To what am I indebted for the honour of this visit?' she asked.

'I want you to do me one kindness,' replied her visitor, who spoke English well, with a pretty accent. 'Let me live in your house. I will for half each day teach the young ladies the French, the dance, the walk'——

'The what?'

'The walk. They cannot walk. See here!' And she imitated the angular pose and stiff gait of the contemporary English schoolgirl with such exactness that the features of Miss Wimple, hitherto puckered up with an expression half of amazement, half of annoyance, relaxed into a smile.

'They are too *steef*—too wooden, and that is a great pity, with such charming faces. Then I will teach the fence—the science of using the sword.'

'But, good gracious alive! my young ladies don't want to fight duels.'

'No! no! But it is a good, graceful, strong-making pastime.'

'And the other half of the day?' asked Miss Wimple.

'I spend at my duty in the prison.'

'Oh my goodness! My dear young lady, do you know what that means?'

'I know it well enough,' replied the girl sadly and earnestly, 'to be certain that it is my duty.'

'But you will catch disease! I hear there were ten burials yesterday. You will see such sights and hear such things! I am told it is so shocking in there that it cannot be described.'

'All the more reason that some one should fight it. But I take your time. I ask no money. To the contrary, if you will, I pay you. I am rich. I give you references from the best families of France.'

There must have been something in the bearing and manner of the maker of this most unusual proposal which appealed to Miss Wimple, apart from the fact that she really was in need of a French teacher, for she said she would think it over. She did; the immediate result being that Ma'mselle came into residence at Parthenon House as French and recreation governess. The later result was wonder on the part of Miss Wimple how she had ever got on without her.

At the date of our story, Ma'mselle—her name was Claudine de Bussy, but she was generally known simply as Ma'mselle or Marmselle or Marm—had been an inmate of Parthenon House for six months. During that short time she had accomplished what, at any rate in that day of international bitterness, no ordinary foreigner could have accomplished in as many years. Ridicule, contempt, even insult, had of course greeted her; but they lasted a very short time. She became the idol of the girls from eldest to youngest; they literally gambolled in their emancipation, under her sway, from the traditional trammels and fads of fashionable education. She upset the old Parthenon House creed of turning young ladies into the most unnatural dolls possible, of returning them to their parents walking, talking, mincing, anticking, grimacing machines, so deftly and so pleasantly that not a few of them actually preferred their school to their home lives. As with studies, so with recreation. For the old miserable two-and-two constitutional and the eternal skipping-rope she substituted fencing, and figure-dancing, and musical-drill, and acting, and would have had them down to the river and taught them swimming but that propriety here felt bound to hold up a forbidding finger.

Over the hearts of Miss Wimple and the other governesses, with one exception, she had acquired complete empire. The exception was Miss Mordant, the English history and literature teacher, a blighted young thing of some thirty-five summers, who worshipped the Dandy Squire with obtrusive ardour, who had of course heard of his passion for Ma'mselle, and who therefore saw nothing in the dainty, unconventional French girl but a bold, brazen-faced intruder, who was not hereabouts without an object very different from that with which she was credited.

Ma'mselle's duties at Parthenon House ended with the midday meal. After this she went to the war-prison, and busied herself there for the two hours allowed her; after which she did great work among the poor of the countryside, of whom in this long, terrible war-time there were but too many.

Captain Heacham, the prison governor, at first told off one of his officers to meet Ma'mselle at the gates, to pass her through the sentries, and to accompany her within the prison; but gradually he took this office on himself, until it came to pass that as regularly as she came so regularly did he appear.

Charles Heacham was a naval officer, and a polished one, which was not always the case in those hard days when sailors were often at sea for years without coming into touch with softening influences. He was a typical sailor to look at, open-faced, clear-eyed, hearty-voiced; a young man to hold so responsible a position, whose chief fault in local eyes was a tenderness of heart toward the poor wretches under his care which was deemed inconsistent with the main-

tenance of proper discipline. He had succeeded a martinet whose stern rule had stirred up more than one mutiny, occasioned many escapes, and finally brought about his removal. But the martinet had seen no service. Captain Heacham had fought Frenchmen too often not to respect them.

A strange world was this great war-prison at Staple Cross. In sixteen huge timber buildings were crowded at the time of our story some six thousand prisoners—officers and men—soldiers and sailors, Frenchmen, Americans, Danes, and Dutchmen, but chiefly the first-named. Elsewhere officers were separated from men, or were allowed to reside outside on parole; but here all were flung together without distinction of rank. In this great mass there were of course men of every shade of goodness and badness, the badness predominating, as the prisoners, especially the Frenchmen, were largely privateersmen—notoriously the scum of the coast population, who usually fought more upon principles of personal gain than of patriotism.

When Ma'mselle started upon her task the prison was one great festering wen of misery and vice. Almost everybody gambled, with the result that most were half-naked. Quarrels were frequent, and generally brought about duels, which—as the possession of arms was, of course, forbidden—were fought with any weapons handy, from window-bars to scissor-blades. Captain Heacham had brought about an improvement in the sanitation; but it was still very bad, and the hospital mortuary never lacked tenants.

Some of the prisoners, being handy fellows of a better class, employed their time in manufacturing with the crudest tools, out of the bones of their food and straw, ingenious, and in many cases even beautiful, objects of use and ornament, which they sold at the bi-weekly market held at the prison gates. With the proceeds the majority gambled, some bought clothes and extra rations, and a few—a very few—formed funds which assumed quite respectable proportions by the time they were released.

Then Ma'mselle appeared on the scene. That a young, fair, delicately bred countrywoman should have deliberately chosen exile in a hostile land solely to alleviate the distress of her unfortunate fellow-countrymen appealed to the hearts of the farthest-gone blackguards in the community, and of their own will they at once conceded her a respect which very soon ripened into a feeling of far-deeper nature. Furthermore, when it was rumoured that she was the sister of the famous young Dunkirk captain, De Bussy, whose privateer, the *Soleil*, had not only for a couple of years past successfully defied all attempts by British ships to capture or destroy her, but had on more than one occasion gained victories against odds, she became the object almost of worship, and was spoken of by lips usually associated with the lowest filth and profanity as *La Sainte Demoiselle*.

It was not likely that the frequent personal attendance of the captain of the prison upon Ma'mselle would escape the notice of her countrymen. At first it was ascribed to watchfulness on his part; but when keen eyes noted what evidently genuine pleasure the girl had in his company, and ears heard her frequent praise of him as one who really had their welfare at heart, and it became the subject of general remark that he was smartened up in appearance to a degree not compatible with his ordinary sailor-like contempt for externals, it was arranged in the public mind that interesting developments were far from unlikely.

(To be continued.)

LOST LINERS.

By JOSEPH HORNER.

We only know she sailed away
And ne'er was seen or heard of more.

LOST absolutely, in the fullest and most awful sense of the term! Swallowed up wholly, mysteriously, by the devouring sea! Such has been the fate of many gallant ships; no single survivor to tell the story; no boat or piece of wreckage, no bottle, not a sign or syllable from the vasty deep to reveal the nature of the awful catastrophe by which vessel, cargo, crew, and passengers were blotted out of existence! There is a weirdness, an awful terror, in such mysterious disappearances. They fill the imagination with horror, and cause mental tension in the minds of relatives of the lost far harder to bear than when the fate of a wrecked vessel is told by survivors. The sinking of the *Royal Charter*, or of the *London*, or the *Northfleet*, though gruesome and harrowing, does not produce in the mind that sense of pain which comes with the recollection of the fate of the *President*, or of the *Pacific*, or the *City of Boston*.

The number of vessels which have so mysteriously disappeared at sea that not a trace of them, or of their crew or passengers, has ever been found is larger than most people imagine. In the North Atlantic service alone, from the year 1841, when the *President* disappeared with one hundred and thirty-six souls, to 1890, when the *Thanemore* of the Johnston Line, with forty-three lives, never came to port, there have been—inclusive of these—no fewer than twenty-four big steamers absolutely and totally blotted out of human knowledge, together with their crews

and passengers, numbering in all one thousand four hundred and fifty-three. At a very moderate estimate, the value of these vessels with their cargoes could not have been less than five million pounds. The sum of human agony involved is terrible to contemplate. And every year vessels are posted up as missing.

The *President*, one of the earliest Atlantic liners, was the first steamer to be lost and never heard of again. She sailed from New York on 11th March 1841, with one hundred and thirty-six souls on board. She was a nearly new vessel, having left the Mersey on her first voyage on 17th July 1840. The commander was Lieutenant Roberts, R.N., a man of iron will and resource. He had taken the *Sirius* on her first voyage from Queenstown to New York in 1838 in eighteen and a half days. The *Sirius* was the first steamer owned by an English company which crossed the Atlantic, and but for the determination of Lieutenant Roberts the crew would not have proceeded; they became mutinous, and said it was utter madness to go on in so small a craft. He insisted, and had resort to firearms, and so brought the little vessel to her destination.

After the loss of the *President* in 1841, thirteen years elapsed in which only one life was lost by the wreck of an Atlantic steamer. It is a curious coincidence that, after the *President* was lost and never heard of, the next great loss of life, which occurred in 1854, was also that of a vessel which disappeared without leaving a trace. This was the *City of Glasgow*, which sailed with four hundred and eighty souls on board. The *Pacific*, of the Collins Line, left Liverpool on 29th June 1856, and with her living freight of two hundred and forty was never more heard of. In the year 1859 an Anchor liner, the *Tempest*, mysteriously disappeared with one hundred and fifty souls. The *City of Boston*, of the Inman Line, with one hundred and seventy-seven persons, was never heard of after leaving port on 28th January 1870. A board stating that she was sinking was found in Cornwall on February 11, 1870. The Allan liner *Huronian* left Glasgow in February 1902 for St John's, and disappeared. The British gunboat *Condor* was lost in the Pacific in 1901. Besides these, the names of many lesser-known vessels swell the long list of tragic disappearances.

The White Star cattle-steamer *Naronic*, with a crew of sixty hands and seventeen cattlemen, was lost in February or March 1893, while on a voyage from Liverpool to New York. She was a month overdue before very much anxiety was felt, as it was known that heavy weather had been experienced in the Atlantic, and it was thought that she might have broken down and was making for the Azores. A boat with the name *Naronic* on it was subsequently found half-full of water and abandoned. In this case the vessel was a new one, launched in May of the previous year. She was built with bulkheads and all modern improvements, was four hundred and sixty feet long, and had engines of three thousand horse-power. Yet she disappeared, perhaps about one thousand five hundred miles from New York, that being the location of the abandoned boat.

Since the veil which conceals the catastrophes that sent the missing vessels to their doom can never be lifted, a wide field of surmise is open. We can only guess at the causes of these losses by considering what has taken place in the case of vessels which have received serious injuries, the nature of which is known. The following are the possible causes which may account for the total disappearance of liners: capsizing; damage from within, as explosion, breakdown of machinery, or fire; damage from without, as collision with an iceberg or with a derelict hulk; and mysterious causes.

In reference to explosions, there are two possible causes. One is due to the steam-boilers, the other to coal-gas generated in the bunkers. Accidents from both causes have frequently occurred; and though it is not easy to see how the force could be sufficiently great to rend a vessel asunder without affording time for the use of boats or life-saving appliances, yet the possibility must be admitted. Boilers are always in the bottom of the vessel, and it is quite conceivable that one or more boiler-explosions would rupture the sides and let in the water in large volumes. In the case of a tug in Cardiff Harbour this actually happened. And although the loss of no big vessel has been traced to this cause, it must be admitted that the cause would be sufficient, and the end would be sudden.

Explosions of coal-gas have occurred; and in past years, when less attention was paid to ventilation than at the present time, and when vessels were built of wood, it is within the bounds of possibility that an explosion might have torn a hole or started planks, or might have given rise to a fire of large extent. If to this is added the terror of rough weather in the night, when most of those on board would be asleep, the chances of any vestige remaining would be slender.

Breakdowns of machinery alone would hardly account for the loss of vessels, but they might do so indirectly—first, by leaving a vessel exposed to the mercy of rough weather; secondly, by damaging the hull and letting the water in. Fractures of propeller-shafts or of propeller-blades are not infrequent occurrences. Neither is damage to a rudder. It is quite conceivable that a vessel disabled thus for several days, and encountering exceptionally rough weather, might be overwhelmed by the sheer force of the waves. In rough weather the chance of a disabled vessel being seen in mid-Atlantic if she drifts out of the regular routes is very slender. Steamers for many years past have been entirely dependent on their machinery, having

no sails to fall back upon. Only in recent years have the most modern and best liners been fitted with twin screws and double sets of engines, one of which remains available if the other is damaged. A disabled vessel might, therefore, in the past have suffered badly if she drifted out of the trade-routes, and might have gone down in bad weather.

Damage to machinery may also be sufficient to explain the loss of a vessel by causing her to sink at once. The *City of Paris*, of the Inman Line, had a big smash in one of her engine-rooms on 25th March 1890. She was coming home in fine weather, and when she was near the Irish coast the starboard engines broke down in consequence of the fracture of the starboard propeller-shaft, and the sea filled the engine-room. Then the massive fragments of the wrecked engine hammering against the bulkhead smashed that, and allowed the water to flow into the port engine-room, completely filling that also. In about ten minutes both engine-rooms were filled with water, adding three thousand tons to the vessel's weight. Yet she still floated securely, and the outer skin was not damaged in the least. The watertight compartments kept the *City of Paris* afloat for three days until help came to tow her into Queenstown. At Queenstown the openings in the sea-connections of the vessel were closed with the assistance of divers. The water was pumped out of the engine-rooms, and with her port-engines and one screw the vessel renewed her voyage, and went on safely and quietly to Liverpool without any one suffering harm. In the case of the P. and O. steamer *Delhi*, which stranded on December 12, 1911, off Cape Spartel, on the Morocco coast, all the passengers were rescued, including the Duke of Fife and the Princess Royal and her daughters.

Capsizing is not so likely a cause as some others. But it is possible. The *Captain* capsized, with the loss of hundreds of lives. The type was, however, very different from that of the liner. But the draught of a vessel diminishes toward the close of her voyage, as coal is reduced. Some vessels are unsteady, and it is conceivable that heavy weather, shifting cargo, and insufficient ballast may cause a vessel to roll over on her beam-ends and capsize. There is little doubt that the *Waratah* capsized by reason of top-heaviness. One of her life-buoys was reported as being found (December 1911) at Waiuku, New Zealand.

But the most probable cause of unexplained losses of ships at sea is fire, or it is one, at least, which divides probabilities with explosions and icebergs. Even on the supposition of an explosion, it seems almost inexplicable that no trace of a sunken vessel should ever afterwards be seen. A missing liner or other large vessel is a source of interest to all seafaring men, and a keen lookout is kept on the track which the vessel was known to have taken. Any stray spar or belt or bit of wreckage, therefore, could scarcely escape observation. If a vessel sinks in mid-ocean some portions float. But if a vessel is burnt everything would probably be consumed, as the vessel would burn to the water's edge. Boats might or might not be launched, according to the rapidity of the rush of the flames, the state of the weather, &c. If boats are launched, say, a thousand miles from land, the chances of rescue or of making land are remote. Fire, therefore, seems adequate enough to account for the loss of some of the numerous vessels which have never been heard of after leaving port.

Considering other possible external causes of the total disappearance of liners, heavy weather must be regarded as a probable reason in some instances. Although we do not admit that the roughest weather would harm a modern liner, we must remember that the older vessels were not so large and powerful as are those of the present time. The *Pacific*, for example, which disappeared in 1856, was not nearly half the length of the latest vessels. Bulkheads had not been brought to the perfect condition of security which they have now attained. Not infrequently even now steamers become waterlogged and reach a sinking condition, and their crews are happy if rescued. It may well happen that vessels have foundered in mid-ocean in consequence of not being able to receive assistance, while the sailors could not take to their boats with any hope of their living in the tempest.

Uncharted rocks also cause the loss of vessels, as in the case of the *Pericles*. But her captain was a man of resource, and no lives were lost.

Icebergs are a probable cause of the loss of some vessels, especially of liners running to Canadian ports. The damage to the *Arizona* may be instanced, and many other vessels have had hairbreadth escapes. A vessel insufficiently secured by bulkheads would stand a poor chance in collision with an iceberg.

Tidal waves are probably accountable for some unexplained losses. There are three classes of such waves—those due to submarine seismical disturbances, solitary waves occurring in an otherwise calm sea (the origin of which is obscure), and cyclonic waves. Each is very dangerous, the first and the last named chiefly in the vicinity of coasts, the second out at sea. It was a seismic wave which wrought such havoc at Lisbon in 1755, and in Japan in 1896, when thirty thousand people were killed. But the effects of these do not usually extend far out to sea, as do those of solitary waves. Many records of the latter have been given where the decks of vessels have been swept of all hands, and of all deck erections. In 1881 all hands were washed off the decks of the *Rosario*. In 1882 the master and half the crew of the *Loch Torridon* were swept off the deck by a tidal wave. In 1887 the *Umbria* was flooded by two great waves. In 1894 the *Normania* was struck

by a solid wall of water reaching as high as the bridge, smashing the cabin on the promenade-deck, and carrying away the music-room and the officers' quarters. The height of tidal waves ranges from forty to eighty feet. The Cunarder *Etruria* was struck by a tidal wave on 10th October 1903, when a Canadian gentleman was killed and several injured. The captain's port-bridge and stanchions were carried away. Though such waves would not greatly endanger the huge modern liners, they might have swamped their predecessors by breaking through the decks or rushing down hatchways and skylights. Many vessels have been lost by being pooped by vast storm-waves, which are not so high as are many tidal waves.

In reference to mysterious agencies, these can be dismissed in the present state of knowledge. The secrets of the sea have been investigated so well that no destructive agent is likely to exist which is not known to science. Collision with a whale would not damage a liner, though it would be bad for the whale. The sea-serpent may be dismissed without comment. The eruption of submarine volcanoes may be dangerous to small vessels, but the idea of harm from them cannot be entertained in connection with the Atlantic service. So that, after all, we are driven back for the solution of these disappearances to the same causes which are known to have wrecked so many vessels. Among these must be included collision with derelict wrecks, which have been known to drift about in the Atlantic for over a twelvemonth, and unhappily the malicious placing of explosives among the cargoes of liners, as was done at Bremerhaven in 1875.

THE CAHUSAC MYSTERY.

By K. and HESKETH PRICHARD, Authors of *Roving Hearts*, *Don Q*, *Tammer's Duel*, &c.

CHAPTER XII.—THE WALLOW OF FAILURE.

ON the following day De Sarsan, entirely satisfied with the position of affairs, started for Paris, taking Wilford Lanceley with him. Alice's gratitude was very real, and she showed it prettily; but she made no mention of having seen Cahusac, or of his intended trip in the same direction. When alone she glowed softly over her interview with Malcolm; he was her lover, and she was proud of him, and of the fact that a man so strong and self-contained should have chosen herself from all the world to love.

Cahusac's dislike of De Sarsan troubled her at first, for the Belgian's interest in Wil, and his uniform kindness, had won upon her; and presently she came to sigh a little over the unlucky prejudice with which he had inspired Cahusac, a prejudice that she hoped in time to be able to overcome by her own influence. Wil liked De Sarsan; he declared himself safe as long as he was in the elder man's company; so for the time being Alice's fears about her brother were at rest. During his absence she hoped some family arrangement would be arrived at whereby he might be provided for, some provision made which would, in fact, permit him to continue the old careless, happy life he had always led.

By means of De Sarsan's aid, and armed with arguments he had put into her mouth, she believed her trustees could be brought to see the force of her wishes. Her instinct had made her aware of De Sarsan's hopes as regarded herself. He wanted to make her his wife, yet he was ready to sacrifice the whole of her fortune to fulfil a point of honour which all those about her called a foolish whim. So strong a proof of her suitor's disinterestedness and nice sense of honour had its due effect upon her mind and her liking for him.

It need scarcely be said that this was precisely the result which De Sarsan had schemed to ensure. The girl had no idea that the honour for which she was battling so blindly had already been discounted by the Belgian; that, in spite of appearances, her fortune was on its way into his pockets and not into those of Wil's creditors; that she was, in fact, about to be made the victim of a clever and heartless swindle. For the truth was that almost the whole of Wilford's debts had been bought in cheaply by De Sarsan's agents, who were instructed to spread abroad the report that Miss Lanceley, not being legally responsible for her brother's debts, would refuse to meet them when the time came.

Things being so far in train, De Sarsan departed in good spirits. Success, amply deserved, as he felt, still waited upon him.

Spring had been cold and damp in Paris that year. On the afternoon of their arrival De Sarsan left Wilford at a certain fashionable club where the play was usually high, and turned out into the streets.

A bleak wind was blowing up from the Seine as he passed along the broad boulevard. He had intended to walk to his destination; but the discomfort of the elements drove him into a *fiacre*, which he dismissed at the mouth of a narrow street where the tall, dark houses spoke eloquently of Old Paris.

He stood still for a second looking up the dreary vista, and crushed his cigar between his fingers. He was a man who delighted in savouring his good fortune; it was a delicious morsel which he rolled perpetually under his

tongue. Even in his thoughts De Sarsan just then did not feel vindictive; when one holds the certainty of power this emotion assumes a piquancy which is pleasant.

He passed down the street to a house on the left hand. The entrance, the stair, and the stout *concierge*, how well he knew them! He mounted slowly, and each step gratified him. In the old days he had absolutely lived here—on sausages and cigarettes! The apartment he sought was at the top; but here Mouchon had lived, and here little Pierette. Yes, yes, he remembered them all! It was a place where the right man could assail almost any reputation by an outlay of a few score francs. And yet the destroyers never fattened.

De Sarsan paused at a door, knocked, and passed in. The room was empty except for its cheap furniture. The fire in the stove had gone out, and crackled as the air grew colder. Dust, cigarette-ends, papers, and the remains of a meal were perceivable to at least two senses.

De Sarsan's eyes rushed over the unforgotten details. All seemed unaltered; even the window remained dirty and cracked as it used to be. He had been in these sodden depths, washed hither and thither by circumstances; but he had risen from the slime, and been carried by the tide of fortune to bask on the bank in the sun of wealth. Another man might have been involuntarily saddened by this contact with the old sordid life. De Sarsan felt nothing but elation. He understood the feelings of those who lived in such rooms, and the sense of having left all that so far behind flattered him.

He flicked a chair with his handkerchief and sat down.

As he did so the door was thrust open, and a small man with a dark stiletto beard entered. 'Ah, it is then you?' he said after a slight pause.

'Yes, it is I, my good Puyfot, come to have a little peep at my old friends.'

The man who had entered was perhaps forty years of age. What his face might have been before the pencils of the passions had worked their designs on it no one could say. He had a laugh between his teeth, but a dumb spirit of hatred sat behind his reckless eyes. His shiny dapperness and gaiety stood in poignant contrast to the seared brow and eyes endowed with the imagery of evil. The man looked what he was—half a genius, desperate; an epicure in vicious knowledge.

'To visit an old friend! What kindness!' Puyfot took off his coat and hat, and hung them up; then he applied himself to the stove.

De Sarsan watched him, and laughed. 'Ah, Ulpien, ever the same! Bad times and a bold face. You remind me eternally of the pretty girls, and then—the headache.'

Puyfot looked up, and his small features were shaken with a little swirl of laughter. It stopped as suddenly as it had begun. The man gave one the idea that his acquaintance with the nauseous side of life was simply illimitable, yet the whole face spoke of a hopeless depth of unhappiness that somehow held its own attraction.

'What have you been doing with yourself?' inquired De Sarsan amiably.

'Is it necessary for you to ask? We know each other,' replied Puyfot. 'I am here. I have been here ten years. Presently I shall die here.' He laughed again; it was the laugh of a moral drunkard, upon whom the liquor will no longer bite.

De Sarsan was amused. 'And afterwards?' he asked.

'Oh, you will know all about that!'

'I know about it?' De Sarsan disposed himself to hear some new jest.

'We shall meet afterwards.' Ulpien stood up and faced him.

De Sarsan frowned. In Puyfot's presence he always felt like a man without a cloak to hide his blemishes. The feeling was so strong that he could have struck the sneering eyes blind.

'Yes,' went on Puyfot, 'we shall undoubtedly meet hereafter—shall I say where there are plenty of girls perhaps, and certainly some headaches?'

'You are looking older, Ulpien,' said the other abruptly.

'Really? That has ceased to affect me.'

'Your way of life is all very well until the gray hairs begin to arrive; then'——

'What of that? I shall never wear gray hairs; old age is in my soul!' The words carried a world of tragedy.

De Sarsan crossed his legs. He had not come there to hear Puyfot's stale confidences in his moments of depression.

'I am very well pleased with the manner in which you are carrying out the affair between *L'Œil* and the *Gas-Lamp*. The thing begins to move,' he said with cold approval.

'Ah, let us to business, then! Begins to move! Pardon me, your instructions and your money have come to an end.'

'So? I am here, however, to offer you more of both.'

'I accept them. We are old friends.'

'You must continue to handle our young diplomat in England tenderly. There are other points you can use.' He lowered his voice and spoke rapidly for several minutes. Puyfot, his eyes closed, his nostrils slightly distended, listened intently until the other ceased.

'Keep it going in the papers, my friend—keep it going. Commit yourself to nothing definite, but also spare nothing in allusions, suggestive possibilities, innuendos, but vague, always vague, and leave the world to draw its own inferences; they will be infinitely worse than the worst you could invent. You can do all this—no one better.'

Puyfot opened his black eyes. 'How you hate him! If you were as good to your friends as you are merciless to your enemies'——

'What then? I pay my friends well,' said De Sarsan brutally.

'You know what I mean. I want money to live on—yes; but I have wanted something else—your influence. I am tired of my part. I can do no more.'

De Sarsan was arrested by the man's manner. 'I have not forgotten your affair, Puyfot,' he said; 'but I have been away from Paris, and it is my personal influence that I must use to forward your wishes. Your tragedy will yet appear; but it is not precisely easy to gain the ear of that great lady who holds the patronage in her hands. Still, now that I am in Paris, I will see what can be done.'

He saw hope gleam for a moment through the other's mask of desperation.

'Will you take it with you — my tragedy, *Astoreth?*' Puyfot sprang up and opened a tin box. 'Look, I shall scarcely dare to part with her—my child, my mistress, my beloved!'

De Sarsan's glance at the manuscript was more than dubious, but he had his own aims in view; at this moment he could afford neither to change nor to lose his tool.

'Yes; let me have it. I will make time to inquire about it.'

Puyfot swung round upon him. 'Oh my friend, if you will do this for me! There are years of labour, of love, of starvation, of waking, of passion, in that child of my soul! Take it—take it! Oh, if I should live to see it acted—to see *Astoreth* sweeping forth in a storm of applause!'

De Sarsan jumped up more briskly than was his wont. 'That will do, my friend!' He put a careless finger on the written pages and turned over one and another while Puyfot watched him.

'Well?'

'My dear man, what can I tell of it? My opinion is not in any case worth the having.' He raised his eyes, and Puyfot, sensitive as a mother over a sick child, read there an entire aloofness of thought from the subject in hand. De Sarsan, while he turned the pages, had been absorbed altogether in his own affairs. 'I fancy, Puyfot, that to-night we may even ask one question. This is it: "What had Lady Cahusac to do with the affair? And what was the mystery of Park Lane one night in April six years ago?"'

He took a bundle of notes from a pocket-book and laid them on the table.

'*Au revoir.* I shall see you again this evening.' The Belgian moved toward the door, opened it; then, glancing over his shoulder, he saw the fixed attitude of the other man. He closed the door—and stayed inside.

Puyfot sank into the chair before the table and buried his head in his arms. Silence reigned over the despairing scene for minutes. Then Puyfot's voice rose: 'I—I—I! Yes, he thought of nothing else; he forgot even the tragedy! As for me, I shall rot here, die here—I, who had ambitions and genius! *Mon Dieu!* I have ambition, I have my genius, and nothing else but regrets; I, who possess a hundred times the talents of that brutal politician. Why do I work for him? Why not kill him—or myself—or both?' He sobbed. 'Fame! — she who stands so far above me!—if I could lie one moment on her breast! And then—and then the night, and—who knows?—the punishment! But I rave! There is no hope—no hope!'

The door opened under De Sarsan's hand with some noise. Puyfot started to his feet. De Sarsan was half in and half out of the doorway.

'The tragedy!' he said. 'I had forgotten it. Can you not bring it with you to-night to "Les Corbeaux"?—By the way, Puyfot, have you not told me that you know something of medicine?'

'I have qualified,' Puyfot answered gloomily. 'I look after some of my poor neighbours. I know also that I carry death here.' He touched himself lightly on the breast. 'Hollow, hollow, like the world I live in!'

De Sarsan looked interested. 'So! You know something about pulmonary diseases, then?'

'But yes — everything — even of the latest discoveries, since I have a personal concern in them.'

'Quite so.' De Sarsan came in and shut the door. 'There will be a young man in my company. He will probably be very drunk. Can you diagnose his case?'

'If I am paid for it,' sullenly.

'That follows naturally. My young friend is near the end, as I think. You will also bring your tragedy?'

'No.'

But De Sarsan was growing weary of his retainer's caprices and furies, which he was inclined to consider begotten rather of absinthe than disappointed genius. 'As you will,' he said, and this time withdrew finally.

Puyfot remained staring at the door. He was a hopeless and unbalanced blend of realist and idealist, a man who spent five hours in dreams to one given to work. He was devoured by a flame of ambition; he heard the Muses screaming to him in his sleep. Had he been more of an idealist men might have taken him at the kindly valuation which they extend to genius. Had he been more of a realist he must have been a name in France. As it was, he was typical of a stratum of artistic life, a stratum which has once been described by a cynic as 'the wallow of those across whose foreheads their own genius has scrawled "failure."'

(To be continued.)

SECRET SERVICE IN SOUTH AFRICA.

By P. L. OLIPHANT.

THE transition of a country from pastoral conditions to the development of its mineral resources is invariably accompanied by a rapid moral deterioration. The mining-camp acts as a magnet, drawing together from the four quarters of the earth a host of adventurers and fortune-hunters whose methods are not tolerated in the strict conventionalism of the civilised world. It may be that some of the more restless of the old settlers join in the rush for the hidden treasure; but they stand but a poor chance with the new-comers, unless they are prepared to adopt the standards and ideals of the Lost Legion. They will find themselves pitted against men, and women too, who are past-masters in the science of getting rich quickly at the expense of their neighbours, unrestrained by the terrors of any law that has not Judge Lynch as its administrator.

Mr Douglas Blackburn and Captain Waithman Caddell, in their book, *Secret Service in South Africa* (Cassell & Company, Limited), have furnished us with a picaresque and highly diverting chronicle of the sub-surface workings of the late South African Republic, full of humour and entertaining stories. It would be excellent reading but for the appalling fact that it is true. One pauses in the midst of enjoying the racy atmosphere of these stories to wonder whether it is possible that a great nation can ever spring from such sordid beginnings. Through the pages pass a procession of rogues and dupes, who are only dupes because they have failed as rogues. The rogues are not the off-scourings of the country, but for the most part the governing men; the dupes are their less fortunate companions; and the tools of both rogues and dupes are the Kaffirs. The attitude of the authors toward the state of society which they depict is strictly non-committal. They simply record the facts, leaving the reader to 'point a moral or adorn a tale.' They hold no brief either for Boer or Briton, for plutocrat or Kaffir. But they make some very pertinent observations on the nature and handling of the native population, which indicate a sympathetic knowledge of that most difficult part of the 'white man's burden.'

The book is divided into chapters giving special and peculiar information on the various phases of South African crime and its detection. There are chapters on the illicit liquor traffic, gun-running, illicit gold-buying, hidden treasure-quests, I.D.B. (illicit diamond-buying), native labour agents, and, most significant of all, the strange story of the Third Raad, which ruthlessly exposes the unabashed corruption of the old Kruger régime—a corruption in which Boer and Briton shared. Of the many good stories to be found in these chapters, mention should be made of the great chief Magato and his calabash of diamonds; of fat Jim, the native thimble-rigger; of the mystery of 'Mr Burton;' besides many tales of illicit diamond-buyers. These chapters are redolent of the Cairo stories of the *Arabian Nights*, calling to mind Calamity Ahab and his entourage of swindlers and rogues. As a record of crime and its detection they have a peculiar interest; but the authors raise our curiosity to a higher level when they touch on events of an historical nature, though it must be confessed that here they do not fully satisfy us. In perusing the chapters on the Boer Secret Service under Dr Leyds, the Jameson Raid, and the Boer preparations for war, we gain the impression that the authors could have told more an they would. In their Foreword to the volume they warn us that 'consideration for the actors, most of whom are still living, has impelled the sacrifice of much interesting matter,' and we must accept their decision; but we do so regretfully, and with a feeling that more remains to be told which possibly can be told by no others. Nevertheless they have much to say of an enlightening nature on these subjects. The story of Kruger's millions, and of his attempt to escape to Europe with them on the *Dorothy*, is dismissed by the authors as an obsession worthy to be included among 'extraordinary popular delusions.' After proving that the millions could not possibly have existed in the Transvaal at the time of the President's escape, our authors continue: 'It is scarcely probable that even Kruger's best friends in the Executive would have permitted him to leave with practically all the plunder.'

The question as to whether Kruger expected German intervention in the war, and the part that Dr Leyds took in endeavouring to secure it, are very fully discussed, with no definite conclusions so far as Leyds is concerned; but as regards the President, we are left in no doubt of his expectations. 'When he reached Europe he learned for the first time that kings and kaisers are not quite as accessible or plastic as native chiefs or even British Commissioners; and, severest blow of all, that Paul Kruger in Pretoria was not the same man in the capitals of Europe. The shock to his stubborn pride was terrible. For days he maintained a brooding silence. When he did begin to speak with his son-in-law Eloff, it was on matters of family and personal business. He evaded as much as possible discussion on the affairs of state. When he mentioned Dr Leyds, it was without bitterness. Once he let fall a remark that might have been interpreted into a reproach that his State

Secretary should have misled him by employing the cautious and equivocal language of diplomacy instead of the blunt, straightforward Taal.'

Into the secret history of the Jameson Raid our authors do not carry us much farther than previous disclosures have led us; but they give much information of a significant nature concerning the arming and drilling of the Uitlanders in Johannesburg and of Kruger's attitude toward the raiders. That there was any real enthusiasm amongst the Uitlanders for their deliverance from the bondage of Krugerism the authors deny. It was with difficulty that an audience could be got together at the monthly meetings of the National Union, an association formed for voicing the grievances of the Uitlanders; but it was a very different story when the enlistment of armed men to fight against the Government began. 'When it became known that volunteers were to be paid a pound a day for membership of a force whose duties not even the commanders could explain, there was a rush of the unemployed. . . . The hours of drill were so admirably arranged that it was possible for a man to belong to two corps, and put in his drill with both. Several enterprising fellows, realising that hay had to be made while the sun shone, joined all three corps, and drew a pound a day from each for ten days. But despite the extra time put in at drill, the martial knowledge gained was amazingly small.' The Pretorian Executive, we are told, refused to take the matter seriously. 'They could not, or would not, believe that there was any backbone in the movement, and events proved that they were right.' Kruger 'had no fear of miners armed with rifles in the streets of Johannesburg. They might shoot one another, and probably would; as to any damage to the town—well, it would hurt Uitlanders, not *oprecht* burghers, for there were very few there. Paul Kruger never loved the great town on the Reef, and the prospect of its being the scene of a serious disturbance did not worry him. . . . If ever Dutch phlegm asserted itself in Paul Kruger, it was during that memorable week.' We must give one more extract from the chapter on the Jameson Raid: 'There is an incident connected with the surrender of Jameson which has not been generally known. He and his surviving officers and men were prisoners on the market square at Krugersdorp when there arrived a party of Boers from the Waterberg district. Owing to the distance of their farms from the scene they did not reach Krugersdorp in time to take part in the final action of Vlakfontein, and heard particulars of the Raid for the first time. Their indignation was great. They rode round the disarmed prisoners in menacing style, pointing their rifles at them and expressing their feelings forcibly. It was a mild-looking old burgher with a white, flowing beard who suggested, "Let 's shoot them now." The idea was caught up and passed round. General Ben Viljoen, then field-cornet of Krugersdorp, heard it, and "went for" the patriarchal proposer in his best style of vituperative comment. His remonstrances irritated the old men. They were outraged at the sight of a young man speaking in such style to one old enough to be his grandfather, and for a minute it was touch-and-go. A post-office clerk took in the situation, and ran for Cronje, who was in the landdrost's office. The old general came out promptly, dismissed Viljoen, and reproached the patriarch in judiciously chosen language. The crisis was averted. The Waterberg Boers rode round the square firing their rifles into the air, causing something like a panic among prisoners and spectators, and then off-saddled. It is a perfectly understood thing to-day that but for Cronje there would have been a massacre on Krugersdorp market square on the opening day of 1896.'

With regard to the Boer preparations for war, we are assured that the Government made no importation of arms on any considerable scale previous to the Jameson Raid, and the authors adduce much evidence in support of this assertion. But subsequent to that colossal blunder the arming of the republic proceeded with all haste and with every appearance of justification. To all representations that the British Government was friendly disposed to the Transvaal, Kruger made the stereotyped reply, 'How can I believe their assurances after Jameson's Raid?' That there was a large and influential war-party in the country and in the Government our authors admit, and Kruger placed himself at the head of it. 'It was the strange personal magnetism that Paul Kruger exercised over his people that silenced the opposition of men like Joubert. Whence he obtained the frenzied folly that induced belief in the impregnability of the Transvaal is no secret. For the first and only time in his life he surrendered his will and judgment to the control of a younger man, Dr Leyds. The greatest puzzle of all is, did the astute, cultured, European-trained Hollander honestly believe that a petty state could hold out against Great Britain's might, or did he believe in the assurances he gave his employers that all was well since the Kaiser was their friend?'

Emphatically, *Secret Service in South Africa* is a book to read. It concerns a chapter in the history of the British Empire which was closed with the establishment of the Union of South African States—a union from which it is much to be desired that the great results expected will be realised. The perusal of this record of South African aims and ideals in the near past discloses a state of affairs which it would be difficult to match in any country in the world, and leaves us with some idea of the thorny path the reformers have to tread before these great results can be

achieved. Natal comes well out of the scrutiny; but then Natal has not yet come across an extensive gold-reef or a deposit of diamond-clay. The authors have told the truth, and they will not be thanked for it, though they have treated their unpalatable disclosures in a light-hearted spirit. To those of us who have faith in the destiny of the British Empire the book will come as a salutary warning, 'lest we forget.'

SLUYS.

By R. A. GATTY.

THERE is so much that is beautiful and fascinating in Bruges that the ordinary traveller is content to wander about the picturesque streets, and not venture farther afield into the open country. If you climb up to the top of the belfry you see at once what a flat, uninteresting land surrounds the beautiful city, offering little temptation to the traveller; and the country roads, with their stone sets, are a trial even in a motor-car. Nevertheless, no one should miss a trip to Sluys. It is easy of accomplishment, for the busy steam-tram which passes along the streets, making a most disagreeable noise, runs out to this little-known spot. The journey occupies about an hour, and it is amusing to pass through the quaint villages, some of which have fine churches; though the necessary noise of blowing of horns to clear the tram-lines of pigs, dogs, and children is a trifle distracting.

At the Dutch frontier a polite official looks into the carriage, and seeing ordinary travellers without baggage, he smilingly bows and retires. Finally the tram draws up at the dockside at Sluys, and you find you have a couple of hours to look round the town. I must own it is difficult to believe that you are actually on the very spot which once was the main seaport for Ghent and Bruges when those cities were at the height of their prosperity. The sea is now a couple of miles away, and it is only by the formation of the ground that you can trace what was once a great waterway leading up to a harbour capable of holding five hundred ships.

The town of Sluys, if you can give it such a name, is merely a shadow of its former self. There is a long, straight canal stretching away to Bruges, some twelve miles distant, and the dock was full of huge barges which were being loaded with beetroot grown in the adjacent district. There were evidences of life and business, and the proprietor of the Hôtel van Brussel informed me they had no poor in the place, and all they wanted was to be let alone. 'We love the English,' he said, 'and are good friends with the French; but we fear the Germans, for we think they intend some day to take our country.'

It was in one of the hotel rooms that I learnt more about the history of Sluys than when walking about outside. The proprietor proudly showed me a series of maps hanging on the walls. The first was a view of the port, with the sea right up to the town, as it was when the great naval battle between France and England was fought in 1340. The action, which began in the mouth of the estuary, ended right under the walls of the town, the engagement lasting for twelve hours. It is said the French lost two hundred ships and thirty thousand men. So complete was the victory that for centuries the English remained masters of the Channel. The next map was different in appearance. The sea had retreated, and only a narrow strip of water led from the town to the coast. Other maps showed this passage still further narrowed, till the last had no water at all excepting the canal leading to Bruges. Several of these maps were original, with the date attached. The first naval despatch we have in our English archives is a letter from Edward the Third to his son giving him the account of the Sluys victory.

As Sluys was such an important port, through which passed the merchandise to Ghent and Bruges, it attracted the attention of the Duke of Parma when he was fighting Philip the Second's battles in the Netherlands. In 1587 he began a siege of the town under the veteran soldier La Motte. We have a good deal of gossip about this event from the pen of the redoubtable Welshman Roger Williams. The garrison forming the defence only amounted to sixteen hundred men, half of whom were Englishmen. Opposed to them was the force of invading Spaniards, numbering about six thousand men. The defence was rendered more difficult from the fact that there were two miles of ravelins and ramparts to protect, and not enough men to cover the ground. Parma found Sluys a hard nut to crack. The town was built on firm ground, but the surrounding land, owing to a stream of inland water, was nothing but shifting sands and treacherous bogs.

Roger Williams, writing in the midst of the siege, says: 'Yesterday was the fifth sally we made. Since I followed the wars I never saw valianter captains nor willinger soldiers. At eleven o'clock the enemy entered the ditch of our fort with trenches upon wheels, artillery-proof. We sallied out, recovered their trenches, slew the governor of Dam, two Spanish captains, with a number of others, repulsed them into their artillery, kept the ditch until yesternight,

and will recover it by God's help this night, or else pay dearly for it.' Such a spirit as this directing the soldiers gave the Spaniards no easy task, but sap and mine had begun their deadly work. It seems that below the city were extensive wine-caverns, and in these for eight days, almost without any cessation, and by torchlight, the two sides fought hand to hand with pistol, pike, and dagger, within the bowels of the earth. Brave men swam out at night down the waterway with despatches to the Earl of Leicester and others in control, imploring assistance. Jealousies among the Dutch, and, worse still, Queen Elizabeth's intrigues with Parma, prevented any organised plan of help. 'It is still possible for the fleet to succour the city,' wrote Roger Williams. 'I do assure you that your captains and mariners do not their duty unless they enter with great loss; but you must consider that no wars may be made without danger. What you mean to do we beseech you to do with expedition, and persuade yourself that we will die valiant, honest men.'

The efforts of the defenders were all in vain, and the city capitulated, 5th August 1587. Roger Williams, with his gilt morion battered, was witness to Parma's entrance. The Prince of Parma, seeing him, asked him, as a brave soldier, to enter the Spanish service. 'My sword,' replied the doughty Williams, 'belongs to her Royal Majesty Queen Elizabeth. When her Highness has no further use for it, it is at the service of the King of Navarre.' Devoted as brave Roger Williams was to his queen, even in her presence he could not restrain his outspoken manner of speech. He had a suit which he wished the queen to grant, and having obtained an audience, he knelt before her in a rough riding-dress. The queen was secretly disinclined to grant the favour which the Welshman sought, and he knew it. Seeing his ill-clad person, Elizabeth turned away her head, exclaiming, 'Pho, Williams! how your boots do stink!' 'Tut, madam!' replied Williams; 'it's my suit that stinks, not my boots.'

Once in the hands of Parma, Sluys became an important place of arms. Acting upon the secret instructions of his master, Philip the Second, Parma began to concentrate troops, and to prepare the flat-bottomed boats which were to convey the Spanish soldiers out into the Channel to meet the great Armada that was shortly to be despatched against England. The plans for the conquest of England, the dethroning of Queen Elizabeth, and the establishment of the Inquisition were drawn up by Philip in his palace of the Escorial, and communicated to Parma. The Admiral Medina Sidonia was to take the Armada from Lisbon to Calais roads, and there he was to wait for Parma, who was to come out from Nieuwpoort (*Anglicè*, Newport), Sluys, and Dunkirk, bringing with him his seventeen thousand veterans, and to assume the chief command of the expedition. They were to cross the Channel to Dover, land the army of Parma, reinforced by six thousand Spaniards from the fleet, and with this army Parma was to march at once upon London. Then Medina Sidonia was to seize and fortify the Isle of Wight, guard the entrance of the harbours against any interference from the Dutch and English fleets, and as soon as the conquest of England was complete he was to proceed to Ireland. 'Most joyful I shall be,' wrote Parma to his master, 'to see myself with these soldiers on English ground, where, with God's help, I hope to accomplish your Majesty's demands.'

This great expedition, planned by the cunning Philip, who to the last moment was endeavouring to hoodwink Queen Elizabeth and her astute Ministers, was very nearly successful. The Armada arrived in Calais roads, and Parma would certainly have come out with his army in flat-bottomed boats from Sluys and Nieuwpoort had not the vigilant Dutch fleet kept watch at the mouths of the estuaries. Here, with one hundred and fifty galleons, sloops, and fly-boats, the Dutch admirals waited for the coming of Parma, ready to sink his overladen craft, packed with men unable to move. Until the Armada had cleared the coast of these nimble Dutchmen it was impossible for Parma to stir. All his preparations and efforts were vain, and the Prince raged and fumed, while the helpless Armada passed along the Dutch coast, driven before the rising gale, and pursued by the English fleet. You can see at Sluys the remains of Parma's vast works, but there is little to tell you of the gigantic struggles which have taken place at that historic spot.

The history of Sluys does not end here. In 1604, sixteen years later, Prince Maurice determined to reconquer the town. It was a prodigious task, as the land all round Sluys was wet and treacherous, and unfit for carrying on a siege. The Dutch, however, were used to such difficulties, and after much labour and fighting the Prince was victorious. The condition to which the town was reduced before it capitulated is thus described: 'It was midsummer, and the famine in the beleaguered town had become horrible. The same hideous spectacle was exhibited as on all occasions where thousands of human beings are penned together without food. They ate dogs, cats, and rats, the weeds from old churchyards, old saddles, and old shoes, and when all was gone they began to eat each other. The small children diminished rapidly in numbers, while beacons and signals of distress were fired day and night. . . . Next day the town capitulated. The garrison were allowed to depart with the honours of war, and the same terms were accorded to the inhabitants, both in secular and religious matters, as were usual when Maurice reoccupied any position for the republic. Between three and four thousand creatures, look-

ing rather like ghosts from the churchyards than living soldiers, marched out, with drums beating, colours displayed, matches lighted, and bullet in mouth. Sixty of them fell dead before the dismal procession had passed out of the gates. Besides these troops were fifteen hundred galley-slaves even more like shadows than the rest, as they had been regularly sent forth during the later days of the siege to browse upon sontinelle in the submerged marshes, or to drown, or starve if unable to find a sufficient supply of that weed.'

It must be admitted that Sluys has an interesting history. It is difficult, as you wander about this pleasant spot, to realise all it has gone through, and to believe it was once of such great importance. I had arrived by tram, and had seen the route by land from Bruges, but I was delighted to find a small steamer in the dock which was shortly starting to return by the canal. I secured a seat on board, but I found we had other duties than merely making a homeward trip. One of the huge barges laden with beet-root had to be taken in tow, and this involved a great deal of shouting and excitement before all was made fast and we slowly wended our way down the broad canal. Before us lay the low lands where once fleets had fought, now green with grass and dotted over with browsing cattle. Nothing could be more peaceful and beautiful, for the sun was sinking into the sea, and rich sunset lights tinted the houses of the old town with varying colours. The boatmen hailed us as we went by, descendants, perhaps, of those sea-dogs who had guarded England in the past from Parma's troops. We went by the water-gate which Parma himself had constructed, but there was nothing outwardly to remind one of the terrible scenes which had more than once made Sluys famous in the annals of war.

The kindly sea has silted over the records of the past, and if Sluys is now an inland town, it is surely a happier place than in those days when ships moored alongside its quays and nations fought for its possession. 'I cannot make out why you Englishmen go to Sluys,' said a Belgian gentleman to me on my return; 'it is one of the dullest, stupidest places I know.' To him, perhaps, but not to others who know the part it played in the story of the great Armada.

BRUMÈRE.

By Colonel STANLEY PATERSON.

IT was deep in the wilds of a far western land that Brumère fell sick. Fever's gaunt arm, reaching out of the marsh-mists, seized him with burning fingers, tore, racked, and shook him, throwing him down daily weaker and weaker, and visibly nearer to his end.

None of us knew much about Brumère. Picked up casually in the distant down-country, a vagrant Frenchman, he attached himself eagerly to our expedition, apparently quite content to live on the scanty food our stores could supply and the meagre pecuniary pittance our finances could afford to pay him; and by his willingness, unfailing good temper, and fearlessness of danger he soon endeared himself to all, and became the almost indispensable handy-man of the expedition.

When, on the lower reaches of the river, the engines of the launch broke down, Brumère put them right; later, when the canoes rotted and leaked, 'twas Brumère's assiduous patching that alone kept them afloat. And still later, when—deserted by our carriers, foodless, and surrounded by threatening Indians—we were forced back through leagues of trackless virgin forest, it was mainly owing to Brumère's resourcefulness and dogged pluck that we reached our canoes alive.

We never asked whence he came. In the wildernesses of the earth man troubles not overmuch as to the antecedents of his fellow-man. There a man is a man by the strength of his own virility; the ordinary rules of the social code that bind us so tightly in civilisation no longer apply, and by his daily work alone a man is judged.

Though Brumère was always cheerful when spoken to, he had a sad and wistful expression; and when work was not hard and plentiful—which was seldom—he would sit for hours gazing with eyes unseeing to his immediate environment, but obviously strenuously fixed on some view far beyond the foliage of the forest giants that bounded the limit of our visible horizon.

. . . . . .

The day's work had been arduous—all the more so that Brumère had taken no part in it—but we had now reached a place of safety. The canoes were beached on the soft sand, huge fires lighted in the forest, without, however, dispersing more than a few yards of its gloom, and Brumère had been carried tenderly to a hammock slung near to them. It was obvious to all that he could travel no farther. Pity was on every face, and even the superstitious peons crossed themselves as they passed him.

Making my nightly round of the camp, I saw him beckon, and went up to him with a sad heart, but with cheerful words on my lips.

He slightly smiled, and muttered, '*Non, non;*

c'est fini; je vais mourir.' Then, after a pause, he said, '*Mon commandant*, you have been kind to me. Will you do me another kindness? Will you write to Marie? You do not know Marie—no?' He passed his hand feebly over his brow. 'I had forgotten. She is my fiancée; she waits for me there in Toulon. Is she not beautiful?' he queried, weakly indicating a locket hanging round his neck.

I examined the photograph of a very ordinary-looking grisette, but of course agreed in his estimate. After all, every one does not think alike, and to be loved is to be beautiful in one person's eyes at least.

'They told me she was false to me, that she played *cocotte* to Grouchon; yes, and he told me so too, to his cost, *le misérable!* But they lied. I do not believe any of them. To be sure, Grouchon was always with her. We loved not one another, he and I. And Marie feared and hated him; she told me so, and with a stamp of her foot begged me to kill him. And I jestingly agreed. What could it be but a jest when he was *sous-lieutenant* of marines, and I only *mécanicien* of a gunboat? Then my ship was ordered to the East, where the Black Flags were everywhere plundering and murdering the sons of France. She came down to see the ship sail, and promised to wait for me; and as we steamed out of the bay I saw her standing on the quay with Grouchon. And so she waved me farewell.

'Two years passed—years of privation, pestilence, and constant combat—years when I learned to look death in the face and fear it not. War and sickness had claimed many of my comrades; but I remained strong and well, and was now promoted to petty officer. *Ah, mon commandant*, would that the fever had taken me then instead of now!

'Then we were ordered away in the boats, twenty of us, to carry stores and temporary relief to a fever-worn and hard-pressed garrison in a fort situated some distance up a small creek—one of the advanced outposts of our line.

'Just as dark fell and the night mists closed down on the river, we pulled alongside the little jetty of the fort, and found an eager and weary garrison awaiting us; for their stores were nearly exhausted, and from the effects of wounds and sickness scarce sufficient men remained fit to keep the very necessary watch round the fort at night. All looked pinched, worn, and haggard, and had a drawn and anxious expression on their faces very different from the look on the face of the old soldier who has faced death often, and fears it not. For these were but conscript-lads lately landed in the country, and condemned to learn their first war-experience in this swampy death-trap, poor boys! We at once disembarked and passed through the fort-gate, and there, in the dim light of a swinging-lamp, I saw a face I knew—Grouchon. He took no notice of me, but talked earnestly to our lieutenant, who shortly came over to me and said that in order to give the garrison a much-needed rest it had been agreed that we should undertake the duty of guarding the fort for the night, and ordered me to fall in six men immediately to relieve the sentries on the ramparts. Grouchon it was who marched us off; but, just as we were starting, he told me to let one man fall out, as five men would suffice. And I distinctly saw him smile as he spoke.

'Steadily we marched along the line till all the men were posted, but still Grouchon moved on. Soon we came to a small sally-port close to the river, and in a most exposed position, where he halted, and, turning to me, said, "This is your post." Now, as you well know, *mon commandant*, it is not right that a petty officer should mount sentry like a common soldier; but I am not one to argue with orders, nor can it be said that in times of difficulty or danger Brumère ever failed, so I shouldered my rifle and stepped on to the post without a word. A dangerous-looking post it was, and I now understood the tense expression I had noted on the soldiers' faces.

'A low rampart affording no protection to a sentry ran along the bank of a deep creek, over which a light bridge led to the sally-port, which was closed with a light iron door. Thirty yards on the other side of the creek was open ground, then a sombre mass of virgin jungle in which an army of Black Flags might lie hidden in comfort, and shoot the sentry at any moment—an event, I afterwards heard, of not uncommon occurrence. However, no bullet disturbed my watch, and the events of the day took my thoughts back into the past, and kept them so busy that it seemed a very short two hours before I again heard the steady tramp of the approaching relief, and distinguished their forms by the uncertain light of the half-moon which was just struggling above the horizon. Twenty yards from me the relief halted, and Grouchon came on alone. Walking close up to me, he said, "I cannot relieve you now. You must do another turn; it will give you plenty of time to think of your Toulon light o' love." Then, low between his teeth, he said things of Marie—such things as I cannot repeat, *mon commandant;* such things as brought the hot blood boiling to my head and my bayonet threateningly to the charge. "Coward, you lie!" I cried. "Ah, assassin, you would murder me!" he replied, grasping his revolver. Then, *mon commandant*, all sense and knowledge went from me. I only heard Marie whisper again, "Kill him!" and with all my force I struck.

'Well, they were all my shipmates, the relief, and they tried to save me. Apparently they told so good a story that the court-martial recommended me to mercy, and my death-sentence

was commuted to transportation for life. They called that mercy! Why, every day of those awful five years in prison was worse than any death. There is no need to tell you of them, or of our escape, and the nightmare of our life in those dread pathless forests. We were wild beasts, and worse, *mon commandant*. I shudder to think of it. Suffice it to say seven of us escaped, but only two reached this country. Good-bye, *mon commandant;* you will write to Marie, will you not?'

I promised, and went slowly and sadly to my hammock, where for long I lay awake, musing on the unalterable chance of circumstance and the dire power for the making or breaking of a man's life that lies in the hands of a woman. Alas, how recklessly too many of them use it!

Next morning we were roused as usual by the sounds of awaking life in the forest, but there was no awaking for Brumère. Carefully we laid him under an orchid-covered forest-tree, and the peons fixed a rough wooden cross above the place where he lay. Then, with a heart welling with pity, I sat down and wrote to Marie as tender a letter as rough man could write—a letter to be posted months later in a far-distant colony that welcomed me back to comfort and civilisation. And there, in the course of work, there came into my hands a letter from the Governor of a neighbouring French colony enclosing a list of prisoners escaped from his penal settlement, and asking for any information regarding them. I said nothing, though the list contained a name and description I knew well; but I smiled and thought of that orchid-decked grave in the far-away forest.

Since then years have passed. The French Governor is still hunting for his lost *forçat*, and I—I am still waiting for news of Marie.

CROCODILE-CATCHING IN BORNEO.

By the Rev. EDWIN H. GOMES, M.A., Author of *Seventeen Years among the Sea-Dyaks of Borneo.*

IT is a common sight in Borneo to see a large crocodile sunning himself on the muddy bank of a river. He takes no notice of the natives, even though they pass quite near him. So common, indeed, is the sight that the Dyaks themselves pay no heed to these dangerous reptiles; and yet it is no unusual thing in Borneo to hear of some human life being taken by a crocodile. For months perhaps the crocodiles in a river live at peace with mankind, and then suddenly one of these creatures will carry off some lad bathing in the river, or even attack some one paddling along in his boat. I know of a Dyak girl who, when sitting and paddling at the stern of a canoe, was knocked over into the water and carried away by a crocodile, and her companions could do nothing to save her. There seems to be no reason why the crocodile should suddenly show a man-eating propensity in this way. The Dyaks account for it by curious superstitions. They say that if food is offered to a person, and he refuses it, and goes away without at least touching it, some misfortune is sure to befall him, and he will most probably be attacked by a crocodile. Also, it is said that one of the ways the gods punish crime is by sending a crocodile to attack the culprit; and I have often heard it said by Dyaks of some one who has been killed by a crocodile that probably he had displeased the gods, either by paying no heed to the warnings sent him in dreams or by means of omen birds, or by committing some hidden crime.

The Dyaks of Borneo will not kill a crocodile except in revenge. If the animal will live at peace with him, the Dyak has no wish to start a quarrel; if, however, the crocodile breaks the truce and kills some one, then he feels justified in retaliating. Under these circumstances, the Dyaks set to work to find the culprit, and go on catching and killing crocodiles until they succeed in doing so. The Dyaks generally wear brass ornaments, and by cutting open a dead crocodile they can easily find out if he is the creature they wish to punish. Sometimes as many as ten crocodiles are killed before they manage to find the animal they want to be revenged on. Having succeeded in doing this, they once more live at peace with these reptiles until such time as the truce is broken again by some crocodile killing a human being.

There are men whose business it is to catch crocodiles, and who earn their living by that means; and whenever a human being has fallen a victim to one of these brutes a professional crocodile-catcher is asked to help to destroy the murderer, and a large reward offered him. The majority of natives will not interfere with the reptiles, or take any part in their capture, probably fearing that if they do anything of the kind they themselves may some time or other suffer for it by being attacked by a crocodile.

The usual way of catching crocodiles in Borneo is with a baited wooden bar and slack cable. A piece of hardwood, about an inch in diameter and about ten inches long, is sharpened to a point at each end. A length of plaited bark of the baru-tree, about eight feet long, is tied to a shallow notch in the middle of this piece of wood, and a single cane or rattan, forty or fifty feet long, is tied to the end of the bark rope, and forms a long line. The most irresistible bait is the carcass of a monkey, though often the body

of a dog or snake is used. This bait is securely lashed to the wooden bar, and one of the pointed ends is tied back with a few turns of cotton to the bark-rope, bringing the bar and rope into the same straight line. The more overpowering the stench of the bait the greater is the probability of its being taken, as the crocodile has a preference for putrefying flesh. When a crocodile has fresh meat, he carries it away and hides it in some safe place until it decomposes.

The next thing is to suspend the bait from the bough of a tree overhanging the part of the river known to be the haunt of the animals. The bait is hung a few feet above the high-water level, and the long rattan line is left lying on the ground and the end of it planted in the soil. Several similar lines are set in different parts of the river, and there left for days, until one of the baits is taken by a crocodile. Attracted either by the smell or sight of the bait, some animal raises himself from the water and snaps at the hanging bundle, the slack line offering no resistance until the bait has been swallowed and the brute begins to make off. Then the planted end of the cane line holds sufficiently to snap the slight thread binding the pointed stick to the bark rope. The stick thus returns to its original position at right angles to the line, and becomes jammed across the crocodile's stomach, the two sharpened points fixing themselves into the flesh. The crocodile swims away, dragging after him the long cane line attached to the bait which he has swallowed. Sometimes the cotton holding the bar to the line fails to snap. In that case the crocodile becomes suspicious of the long line attached to what he has swallowed, and, climbing up the river-bank, disgorges the bait and unopened 'hook' in the jungle, where it is sometimes found. But should the cotton snap and the bar fix itself in the animal's inside, nothing can save the brute.

The formidable teeth of the crocodile are not able to bite through the rope attached to the bait, because the bark fibres of which it is loosely made get between his pointed teeth, and the rope holds, no matter how much the fibres get separated.

The trappers each morning visit the different traps to see if any of the baits have been taken, and if any are missing they search for them. They seldom fail to find the rattan or cane floating on the surface of some deep pool at no great distance from the spot where the bait was set. A firm but gentle pull soon brings the crocodile to the surface, and if he be a big one he is brought ashore; though smaller specimens are put directly into the boat and made fast there.

Professional crocodile-catchers are supposed to possess some wonderful mysterious power over the animals which enables them to land them and handle them without trouble. I have seen a man land a large crocodile on the bank by simply pulling gently at the line. But this is not surprising, as, from the crocodile's point of view, there is nothing else to do but follow when every pull, however gentle, causes considerable pain.

The rest of the proceeding is more remarkable. The animal is addressed in eulogistic language, and 'beguiled,' so the natives say, into offering no resistance. He is called a 'rajah among animals,' and is told that he has come on a friendly visit, and must behave accordingly. First the trapper ties up his jaws—not a very difficult thing to do. The next thing he does appears to me very risky. Still speaking as before in high-flown language, he tells the crocodile that he has brought rings for his fingers, and he binds the hindlegs fast behind the beast's back, so taking from him his grip on the ground, and consequently his ability to use his tail. When one remembers what a sudden swing of the muscular tail means, one cannot help admiring the courage of a man who coolly approaches a large crocodile for the purpose of tying up his hindlegs. Finally, the forelegs are tied in the same way over the animal's back. A stout pole is passed under the bound legs, and the animal is carried away. He is taken to the nearest Government station, and the reward given according to the length of the animal killed is claimed.

Though the animal is spoken to in such flattering terms before he is secured, the moment his legs are bound across his back and he is powerless for evil the natives howl at him and deride him for his stupidity. Later on they rip his belly for human remains, and hew him to pieces. He struggles furiously, but to no purpose. His head is cut off and hung up over the fireplace, side by side with the cluster of human heads taken in warfare.

The professional crocodile-catchers are generally Malays; but now there are Dyaks who have given up their old superstitious dread of the animal, and are expert crocodile-catchers, and quite willing to earn money by catching and killing crocodiles if required to do so.

THE SPELL OF NIGHT.

Oh soft-winged spirit of the midnight air!
Breathe on my lips that they may learn to sing
Thy melodies in notes more pleasing; bring
Sweet thoughts and dreams divine and fancies fair.
Thy sacred presence is a voiceless prayer,
Fond memories about thy garments cling;
Hearing the flutter of thy passing wing,
I see thee not, yet know that thou art there.

Oh blest magician! teach me how to bear
The trivial woes of life, the poisoned sting
Of irritant and sleep-forbidding care.
Waft me away to where through heaven swing
The great, slow stars; for here are dull despair,
And tears, and discontent, and murmuring!

SEVENTH SERIES

RIO DE JANEIRO, THE QUEEN OF TROPICAL CITIES.

By JOHN D. LECKIE.

WHEN the early Portuguese navigators, creeping cautiously along the partially explored coast of South America, discovered the vast bay on which the Brazilian capital now stands, they imagined that they had arrived at the mouth of a mighty river, and christened it Rio de Janeiro (River of January) in honour of the date of discovery, January 1, 1531. The mistake was a very natural one, for their native Lisbon is situated on a landlocked estuary of a very similar nature at the mouth of the Tagus. Curiously enough, the Spanish navigators who, a few years previously, had discovered the River Plate fell into the opposite error. Noticing the freshness of the water, they called it the Mar Dulce, or Fresh-Water Sea, quite ignorant of the fact that they lay in the estuary of a great river, though no land was visible, for the shores of the River Plate are for the most part low and flat, and only visible on a close approach.

Rio, like Sydney and a few other places, claims to have the finest natural harbour in the world. The writer has seen both the harbours named, but it is difficult to make any comparison between them, as the beauties of each are of an entirely different nature. Sydney harbour owes its picturesqueness to the lateral coves which open on either side, displaying ever-changing vistas of beauty as the steamer threads her way through the central channel. On every side pretty villas nestle among gardens and shrubbery which extend down to the water's edge, and the charming surroundings continue until the steamer is moored alongside the circular quay in the heart of the city.

In Rio de Janeiro, on the other hand, the beauties of the landscape are not so much in the harbour as in the surrounding mountains and the views which they present. A long way before the harbour is entered these noble landmarks serve as a guide to the mariner. The first to be descried is the famous Sugar-Loaf, a conical peak of granite which stands like a sentinel at the entrance to the harbour. Conical peaks of the same kind are common along the coast of Brazil, the formation of which is granitic. The names of other peaks in the neighbourhood of the harbour suggest their fantastic shapes. First there is the Corcovado or Hunchback, so called because, when viewed from a certain point, it presents the outline of the bent head and shoulders of an aged man or hunchback; another characteristic peak is the Gavea or Topsail; while in the distance the peaks of the Organ Mountains are visible, so called from their fancied resemblance to the tubes of a church organ. These are only a few of the many peaks which are visible, for Rio is surrounded by a mass of mountains; indeed, the city is partially built on and around them, for here and there isolated hills too steep to be built on raise their verdure-clad heads over the mass of houses below, and add to the picturesqueness of the scene.

The transient traveller whose visit to Rio is confined to the few hours the steamer remains in the harbour can form no proper idea of the city, the older portion of which (that which lies closest to the Custom House and landing-stage) conveys a rather unfavourable impression. Here the streets are narrow and old-fashioned. The city, confined to the narrow valleys between lofty hills, extends for many miles in various directions, and cannot be properly inspected in a short time. The best portions of Rio, the newer city and the charming suburbs of Botafogo and Laranjeiras, are at some distance, and very often are never seen at all by the casual traveller. Botafogo lies along the shores of the bay, but not the commercial portion. On one side are the placid waters of the bay, with a view of the Sugar-Loaf, and on the other side the emerald frame of the mountains forms the immediate background. Here are the homes of the rich; there is an elegance about them to which no other city of South America (not even Buenos Aires) can aspire. The stately mansions of granite, the avenues of lordly palms, the beautiful private gardens laid out with exquisite taste and adorned with statues and fountains, the luxuriant vegetation of the tropics, all combine to give one an impression of the oriental splendour described in *The Arabian Nights*.

Great improvements have been made of late years; in fact the city has been completely Haussmannized. In many respects Rio is at a

 [*All Rights Reserved.*]

disadvantage compared with her great southern rival, the Argentine capital. The flat, monotonous nature of the ground on which Buenos Aires is built is an advantage in so far as it allows a free expansion of the city in all directions. Rio, on the other hand, is shut in between lofty hills, and the streets follow the windings of the narrow valleys, a fact which greatly hinders the development of the city. In Buenos Aires the streets, nearly all of equal width, cut each other at right angles, on the chess-board principle so common in American cities. This is very favourable to the regulation of traffic, which can be more evenly distributed and is not confined to one or two leading thoroughfares, as every street is really a thoroughfare, and no matter in what direction one travels, one can always find a parallel street at a short distance. Notwithstanding this favourable circumstance, of late years the traffic in the central part of Buenos Aires has become so great that serious inconvenience is caused. But what about Rio, where no such arrangement of parallel thoroughfares is possible? In the latter city, also, many of the streets are so narrow that tramway-cars can only travel in one direction, and even then they encroach so closely on the narrow pavement that the pedestrian must exercise constant vigilance if he does not wish to be caught by the projecting footboard or splashed with mud from head to foot.

The Fluminenses, as the inhabitants of Rio call themselves (from *flumen*, the Latin name for a river; Portuguese Rio), are jealous of the magnificent new boulevard, Avenida de Mayo, which the Porteños (inhabitants of Buenos Aires) have opened up in the centre of their city. Not to be behindhand, they also built a new boulevard in Rio, which they called the Avenida Central. Although a fine avenue in many respects, the Avenida Central has not come up to the expectations of its founders. One of the reasons attributed is that business has not increased so much as was expected, owing partly to the fact that the rapid rise of the neighbouring port of Santos has been effected to a great extent at the expense of Rio. The main export of both cities is coffee, and Santos is not only on the whole a more convenient shipping point for the coffee districts, but the region tapped by it (the state of São Paulo) is one of the richest and most progressive in Brazil.

The Fluminenses are proud of their city, which is not undeserving of the title of the Paris of South America, and have spent millions on improving it. Their municipality is one of the most enterprising in the world, one fruit of their enterprise being the magnificent new municipal theatre built at a cost of six hundred thousand pounds.

The British colony in Rio is far from being so numerous as that of Buenos Aires. This is probably due in great measure to the tropical climate, which does not suit the British constitution so well as the more temperate city of the south. The number of British commercial houses is few in comparison with those established in Buenos Aires. In walking along the streets in the more central parts of the Argentine capital one recognises British faces and hears the language of Shakespeare at every turn; indeed, in the neighbourhood of the great banks (all close together) one hears almost as much English as Spanish. No better evidence of the number and importance of the Anglo-Saxon community could be given than the fact that two daily papers in English are published in Buenos Aires; there were formerly three, but two of them amalgamated. The British community in Rio is as yet far from having attained this importance.

In the neighbourhood of Buenos Aires there are few resorts where the British resident can take an outing or spend a holiday. The favourite place is the Tigre, a swampy district about an hour by rail from the city, where he can indulge in bathing, boating, and fishing of a kind, in the muddy waters of the River Plate. If he wants a genuine seaside resort he must betake himself to the neighbouring republic of Uruguay or to the fashionable bathing-place of Mar del Plata, both too distant for a day's outing or even for a week-end. In fact these, as well as the mountain resorts, such as the Sierras de Cordoba, are only accessible to the rich and leisured class.

In Rio matters are different. Here the holiday-makers find mountain and seaside resorts within easy reach and accessible to the poorest; indeed there are many such resorts in the immediate suburbs of the city. The Corcovado Mountain, already mentioned, has a cogwheel railway up to the very summit, which commands a magnificent view of the city, harbour, and surroundings. This isolated peak (elevation, two thousand four hundred feet) rises so perpendicularly that the eye travels freely in every direction, and one has the impression of being up in a balloon or on a natural Eiffel Tower. There are few mountains in the world which can furnish such a magnificent and complete view of their immediate neighbourhood.

Another suburban mountain retreat is Tijuca, also accessible by tramway; it is a miniature Switzerland, with picturesque dells and waterfalls. For those who wish a quiet bathing-place there are numerous islands in the bay where bathing, boating, and fishing can be indulged in. Here, in a sense, one is out of the world within sight and easy reach of the great city. If the bather wants the heavy surf of the open sea he can go to Copacabana, on the outer edge of the harbour. If he wants a mountain retreat where he can enjoy coolness while Rio is sweltering in tropical heat, a short trip across the bay and railway continuation lands him in Petropolis, a beautiful town among the hills. Petropolis is so close to Rio that many business men live here, travelling to and from their offices in Rio every day. Many

of the foreign Ministers live in Petropolis in preference to Rio; here also the Emperor Don Pedro had his palace, for Petropolis is the Versailles of Brazil. Another pleasant holiday can be spent in visiting one of the German 'colonies' nestling among the mountains. In fact, there are at least a score of resorts within easy reach of Rio where a pleasant holiday can be spent.

Secretary Root, of the United States, was much struck by Rio when he visited it not long ago, and expressed his wonder that it had not been 'discovered' as a pleasure resort by the citizens of the great republic. Here again the climate is against it. During the winter season (at least four months of the year) the climate is perfection, but in summer the heat is oppressive; the lofty mountains shut out the cool breeze from the sea. Therefore, although the summer of Rio coincides with the winter of Europe and the United States, the southern city offers no attraction as a spot in which 'to cheat a northern winter.' It must not, however, be supposed that the climate of Rio is necessarily unhealthy. Yellow-fever, once a great scourge, is now successfully combated by modern sanitary science. The writer remembers the case of a Scotsman who emigrated to Rio as a lad of fifteen, and, after passing his whole life there, died in the city as a nonagenarian, after seventy-five years of business activity, preserving his faculties almost to the last, and leaving a numerous progeny. Old Rio residents will remember his name when it is stated that he was the first Lloyd's agent to be appointed in South America. Speaking personally, the writer has lived several years in both Rio and Buenos Aires, and enjoyed much better health in the former city than in the latter.

Mention has been made of the rivalry which exists between Rio and Buenos Aires, each of which claims the rank of the first city of South America. It is not only in its natural beauty and its pleasant and picturesque surroundings that Rio surpasses its rival. There is an air of culture and refinement about the Brazilian capital which is lacking in the case of Buenos Aires, though in the latter city one notes more movement, bustle, and commercial activity. It is the same difference which distinguishes Paris from London, Philadelphia from New York, or Edinburgh from Glasgow. There was a time, not long ago, when Rio was undoubtedly the first city in South America, even in point of population, but the rapid development of Buenos Aires in recent years has changed the relative position of the two cities. Buenos Aires, with a rapidly increasing population of a million and a quarter, claims the proud position of the first city of the Spanish-speaking world of South America, and of the entire Southern Hemisphere. The population of Rio probably does not exceed a million, even if the outlying suburbs and the towns on the other side of the harbour be included. Though Buenos Aires was founded nominally several decades before Rio, the latter is virtually an older city. The former suffered severe vicissitudes during her early history, and was several times destroyed; the progress of the latter was steadier and more permanent. *Chambers's Encyclopædia*, published in 1867, gives the population of Rio at that time as three hundred thousand, and of Buenos Aires as over one hundred thousand. Indeed, the Brazilians state that it was they who gave the first impetus to the commercial development of Buenos Aires. During the Paraguayan war, in which Brazil took the leading part, Buenos Aires served as a base of operations, or at least of supplies for the troops. During the five years of the war millions were spent by the Brazilians in Argentina, where they bought cattle and horses for their troops, and the fleet of steamers constantly occupied in the transport of troops and supplies from Brazil to Paraguay had its headquarters in Buenos Aires. According to the Brazilians, the rapid development of Buenos Aires dates from and was first caused by the Paraguayan war, which lasted from 1865 to 1870.

The writer remembers the first time he entered the magnificent harbour of Rio de Janeiro. It was in May 1894, not long after the suppression of the revolt under Admiral Custodio de Mello. The entrance to the port was studded with forts, nearly all of which bore traces of their recent bombardment by the rebel fleet, and one of them (Villegaignon), built on an island in the middle of the harbour, was reduced to a heap of ruins. For months the rebel admiral had things pretty much his own way, and but for the interference of the foreign diplomatic body and the foreign warships in the harbour there is little doubt that he would have captured the city, which at one time he threatened to bombard. But in this project he was again foiled by foreign intervention.

A number of Brazilian warships are generally lying at anchor in the harbour, where their imposing proportions can be seen to advantage. The Brazilians are very proud of their fleet, and they certainly have some fine ships. The recent construction of three huge Dreadnoughts, among the most powerful ships of war afloat, caused some surprise in Britain, where the general opinion was that Brazil had no need for such an imposing armament. The Brazilians are a proud and ambitious people, and already aim at the position of a great power—a position to which their population (some twenty millions) scarcely entitles them. The revolt of Mello (which would probably have been successful but for foreign intervention) opened their eyes to the importance of a powerful squadron. Brazil is a rich country, and can afford to pay for these costly toys, though in the writer's opinion the money could have been better spent. The electric current for public and private lighting, and electric power for industries and tramways,

are supplied by the Light and Power Company from the hydro-electric works in the valley of the Serra do Mar, fifty miles north-west of the city.

Rio de Janeiro is a capital built on and overlooked by mountains. Among other cities which have the same distinction are Athens, Rome, Berne, Edinburgh, and Tokyo. All of these are capitals of countries which have had a romantic history, and which have defended their independence sturdily and successfully against great odds. Unlike the countries named, Brazil has no ancient history. She is entirely a modern country, but there can be little doubt she has a great future ahead of her. For a tropical nation Brazil displays a vast amount of energy.

THE CAHUSAC MYSTERY.

CHAPTER XIII.—'LES CORBEAUX.'

THEY say its doom is sealed, the once historic café celebrated under the Third Empire for the flavour of its ices and the wit of its customers. Red and gold on the outside, white and gilt within. The company which assembled in these rooms or lingered on the well-known *perron* was composed of that brilliant confraternity the Bohemian Paris of the Pen.

The long central room, set with little round tables, sparkled in glass and silver and snowy napery. Up to the great beam, grotesquely panelled in brilliant colours, rose the laughter and voices of the illustrious throng. For, after all, the men who mould the public opinion of a great nation in any manner whatsoever are by that very fact made illustrious.

It was a representative gathering, showing, like the side of a cleft mountain, many various strata. There were leader-writers with bald heads and scented beards, lynx-eyed financiers, stout and bland, dotted in corners, ordering the best dinners and swallowing with ears as well as mouths, for the journalist may be a liar, but his *chien de métier* takes him prowling abroad early and late; he scents the first breath of rumour, and that to the financier is oftentimes the breath of life. Here and there were anxious, melancholy-eyed men, gatherers of foreign or domestic news, jackals to the lions of assured position on the papers.

These journalists of Paris are unique. They spend their lives in endeavouring to infuse the true literary flavour into their sheets. Their public demand so much, yet they groan under the iron hand of the *feuilleton* and the humorous paragraph and article. Their business is to tickle the Parisian palate with something ever piquant, ever new.

Talk was exchanged from table to table; stories flew from lip to lip; occasionally one man dominated the assembly, gathering every hearer to enjoy the raciness, the brilliance, or the license of his speech.

The voices had now risen to the full blast of the well-dined. Puyfot, who had dreamed of the angels, was there discussing the drama—which he understood—with a third-grade actor who never would understand it. To his right sat Wilford, ghastly pale and already bemuddled, although the evening was young. De Sarsan had handed him over to Puyfot—Puyfot, whose pre-eminence in licentious wit made him famous. But Wilford had got beyond the reach of wit of any sort by this time; he sat with bleared eyes, the skin of the lower lids dragged downward toward the mouth in the drunkard's characteristic grimace. His breathing was rather laboured, and attracted the glance of many a contemptuous onlooker, to whom he offered a strenuous illustration of the genus of his people.

'Have you seen Garlis?' asked his neighbour of De Sarsan. The speaker was a fat, twinkling man of middle age.

'No; I have been in London. What is he doing now, my dear friend?'

'He writes, as you are aware no doubt, much for *L'Œil*.'

De Sarsan interrupted him. 'Indeed?' he asked with raised eyebrows and an air of polite interest.

The fat man drew in his double chin to look at his neighbour humorously. 'But you—you know! The name of the creator of that most admirable paper is no mystery—in Paris,' he said.

'I am no longer in any way connected with the Press,' announced De Sarsan gravely. 'You forget my situation. At the present moment any such connection would be against me in England. No, Gorascon; I have detached myself, with tears, from the idol of my youth.'

Puyfot drew his chair a little farther forward, and bowed to De Sarsan coldly and ceremoniously. 'You have been in England for a long time?' he asked, smiling somewhat constrainedly under his thin moustache.

De Sarsan met the advance with equal coldness. 'Yes.'

Puyfot laughed, a peculiar laugh that had the effect of bringing all heads round again. As has been said, he had a certain reputation for wit. 'Have you by any chance heard of an M. Malcolm Cahusac?'

De Sarsan bowed surprise. 'Certainly. It has been my good fortune to be acquainted with two men of that name.'

'Precisely, father and son. There is a little scandal—a little scandal—fluttering about with

regard to these two men. Is it not so?' Puyfot twiddled a couple of fingers in imitation of flight.

De Sarsan put on a troubled air. 'I have not heard'—— he began hesitatingly.

'Then I will refresh your memory, De Sarsan,' cried the fat man. 'A Sir Malcolm Cahusac died under peculiar circumstances; he was murdered—stabbed, I believe—several years ago in London.'

'An old story!' 'Threadbare!' 'Bah!' 'Puyfot!' The various comments dropped from disappointed lips.

'Old, yes!' cried Puyfot excitedly; 'but not threadbare, since it possessed a political lining of a sort that never wears out. There is a sequel which has remained hidden until to-day.'

'There can be no scandalous sequel about the present bearer of the name. I must have heard it if there had been,' put in De Sarsan.

'M. Cahusac keeps his secrets close prisoners, my friend,' retorted Puyfot.

De Sarsan drew back as if disliking the turn the conversation had taken, but the other men urged the narrator to continue.

'Cahusac senior was killed in the streets of London more than twenty years ago. There were said to be political reasons; but of that later. The mystery is this. Cahusac left a pretty wife—a second wife—and also a child by the first wife, a son of his own name. You follow me?'

'Yes, yes!'

'The boy was five at the date of his father's murder, and he was left, naturally, in the guardianship of his step-mother.'

'Exactly.'

'Some six years ago this M. Cahusac, then twenty-one years old, and his step-mother were dining together alone in their house in London. The servants had withdrawn. All was well at nine o'clock, or even at ten. The servants heard the sound of conversation for some time—until past midnight, in fact. Then the quiet was broken by screams of laughter. A party of servants rushed upstairs. Madam was in paroxysms of hysterical laughter; the young man lay bleeding, unconscious, on the floor. He had endeavoured to kill himself, or—who knows?—the lady had made the attempt to kill him! Why?'

The faces round were all alert with keenness over this mysterious ending.

'Explain! Explain!'

'Ah, that I cannot. Therefore I have applied to M. de Sarsan,' Puyfot replied. 'Madam laughed and laughed continuously until she died, but she never again spoke one reasonable word.—The son—you are acquainted with the son, you have said?' He turned to De Sarsan.

'I know him well,' De Sarsan said with some dignity; 'but this, I have never so much as heard it mentioned.'

Puyfot laughed meaningly. 'Which, in other words, is equivalent to the fact that M. Cahusac junior has had some reason for keeping his own counsel. Is it not so?'

'Precisely. But what a scandal! There must be something hidden. What is it, Puyfot? Tell us the conclusion of the story.'

Puyfot shrugged his shoulders. 'Who can say? This only I have heard whispered. The father was in the habit of telling—selling—secrets; in point of fact, he was a friend to other nations than his own. He occupied a high position in the Government of his country; therefore it was easy for him to gather valuable information. But, alas! he was found out. He died—shall we say?—a martyr.'

The listeners laughed, and Gorascon, who had been scribbling some notes, looked up. 'His name, my good Puyfot?' he said. 'I have forgotten his barbarous name.'

Puyfot was standing at his own table, and his answer went distinctly down the room to the open door. 'His name, messieurs? Malcolm Cahusac!'

'I am Malcolm Cahusac. Who asks for me?' The voice was cold and very clear.

There was a rustle and a stir of immense excitement, and all heads craned in one direction. From the door advanced a group of three men, the foremost of whom, tall, spare, and pale, looked inquiringly about him upon the assemblage whom a moment before his name had held in silence.

(To be continued.)

SHOPS AND STREET-LIFE IN CHINESE CITIES.

By JOHN WYATT.

THERE seems no better initiation into a knowledge of a foreign people than a thoughtful study of the shops and the people in the streets of a large city. This does not, however, apply so much to China, as many of the cities—such as Canton, Hong-kong, Shanghai, Hankow, and others—are wholly or partially under European domination; and the modifying effect upon Chinese character and habits of the constant association with foreigners, the influence of British municipal government and European consular administrations, together with the evils resulting from the large influx of foreign vicious rascalities of both sexes, are plainly visible.

To know the Chinese as they really are we must go to the very verge at least of foreign influences;

and for the purpose of this article Changsha, the capital of Hunan, will be fairly representative. This city has only lately been opened as a port for foreign trade; and, excepting the Customs officials and missionaries, the resident foreigners may be counted upon one hand. Moreover, the Hunanese claim to be the purest descendants of the black-haired race, and they recall with pride that their capital was the only city that successfully resisted the terrible onslaughts of the Taiping rebels. The siege lasted for seven months, and, notwithstanding the terrible famine conditions, they fought and suffered as became heroes. The superior physique and virile bearing of the Hunanese well warrants such a record.

Changsha is an ancient walled city on the eastern bank of the Siang river, one of the southern tributaries of the mighty Yang-tsze-kiang, and contains within its walls about half-a-million people. The government of the city is in the hands of a *taotai* (mayor), under whom are a number of officials who are personally responsible for the peace and good order of the wards over which they preside. The boundaries of these wards are shown by gates across the streets, which are closed every night at eleven; after that hour every passenger may be required by the sentry on guard to give an account of himself. With the Chinese there is no municipal government, no lighting or paving or sewerage rates, no policemen parading the streets, no liquor-shops, and no drunkenness. Assaults and highway robberies very seldom occur, and even in the dead of night the wayfarer may traverse the gloomy streets and darker lanes with far greater safety than in our own towns; a condition of things resulting from the Chinaman's innate love of peace, and the power attached to public opinion, which with them has perhaps a greater controlling influence than in any other civilised nation. The criminal classes, consisting chiefly of those who from the inordinate use of opium or excessive gambling have fallen to the lowest plane, receive scant mercy from officials or the general public; every man's hand is against them, their detection certain, and their punishment severe and swift.

Entering the city by one of the principal gates, we find ourselves in what appears to be a crowded lane, but which is in reality a main thoroughfare. Narrow as is the space of twelve or thirteen feet between the opposing shop-fronts, the roadway is contracted by baskets of merchandise exposed for sale, reducing the roadway to about eight feet. The ground is rather unevenly paved with granite slabs more or less covered with a black, evil-smelling mud, which under the influence of a shower forms itself into thick, miry pools. Scattered about are vegetable garbage, entrails of fish and fowls (presently to be eaten by dogs), and other refuse. This state of filth is supplemented by the splashings from buckets in which coolies are carrying away the contents of public and private conveniences, and by the less objectionable overflowings of the buckets of the water-carriers. In the hot season these conditions cause the atmosphere to 'hum' in no uncertain manner, and the historic 'seventy several and separate stinks' of Cologne are completely dwarfed by the gigantic one offensive smell that pervades a Chinese city. To keep the tobacco-pipe fully going is the only relief.

Overhead, the streak of sky is darkened by numberless flags and signboards bearing devices and lettering in gilt, blue, and red, which advertise various trades and tradesmen.

The crowd passes to and fro in a most orderly manner. There is no jostling, no individual rushing or striving to get ahead of those in front, no rule of the road, no instructions to 'keep to the right.' Every one follows his own inclination; but the spirit of compromise and reciprocity so completely pervades the Chinese character that each one willingly gives way sufficiently to prevent disorder. This voluntary custom becomes compulsory when coolies pass along with heavy burdens, as all are expected to get out of their way; and if the cry of 'Ai-ai-ai!' be unheeded the absent-minded pedestrian may find himself sprawling among baskets of fish or vegetables, or making a too close acquaintance with the filthy ooze on the roadway, the mishap bringing forth roars of laughter from the crowd. But should the sounding-gong denote the approach of a mandarin, then burden-carriers and public must adjust themselves on either side as best they can to provide a clear way for his mightiness, whose sedan-chair, preceded by the gong-beater and an official bearing aloft the large, red umbrella, and followed by a retinue, sweeps past at a good jog-trot pace.

A noticeable feature is not only that all the people—the human beast of burden (the coolie) excepted—seem well dressed, but appear to carry an air of contentment and geniality. Their chatter and laughter are no small factors in producing the din so characteristic of Chinese streets. Another feature foreign to Western cities is the total absence of women in the streets, a few of the lowest or coolie class and beggars being exceptions. The urchin or street-arab is also conspicuous by his absence; he is kept well in hand, and if not working is at school.

One of the strangest sights, perhaps, in the world is to be seen in the streets of the towns of Hunan. It may be described as 'itinerant houses of refuge.' Should an old man or woman be rendered helpless by paralysis, blindness, or some other calamity, and the family be too poor to provide proper sustenance, the neighbours subscribe their mites and build small wooden structures exactly like our dog-kennels, with the addition of a pole on each side for carrying purposes. In size they are about six feet by three

feet, and four to five feet high. The unfortunate person having been placed within, the box is carried away at night and dumped down in front of a house or shop. Henceforth all responsibility for the patient's welfare rests with the householder at whose door he happens to be placed. The temporary host sees that his unknown guest is properly tended and fed, and, if necessary, supplied with clothes. After a couple of days the 'kennel' is cleansed, new straw provided, and then it is carried away to another house. In this way it is passed on from place to place *ad finem*, when the authorities bury the body. This forced charity is not felt to be a burden, but is considered a duty to be honourably performed.

It is not an uncommon thing to see a Chinese gentleman carrying a pet bird perched upon a piece of bamboo, to which, as he walks along, he talks and whistles, and is rewarded by the chirruping replies of his feathered friend.

The street-hawkers are a bit of a mystery. They advertise their fantastic wares with loud cries, but never seem to sell anything; the perambulating 'smoke-seller' being an exception. The bowl of his dilapidated water-pipe holds a pinch of the common Chinese tobacco-dust, just affording one good whiff to the customer. Charge, one *cash*, forty to the penny. One shudders to think of the mouthpiece.

Cheap diversion may be obtained by watching performing mice, birds, or frogs, whose theatre, consisting of a small table, is unexpectedly discovered in some nook or angle. A few *cash* will make the proprietor happy for the day. Boys performing neat tricks of legerdemain are often seen, while the open space before the gates of a yamun (court of justice) may be used as a 'pitch' by strolling acrobats. Seeing one of a troupe keeping back the crowd by swinging a ball round and round conjured up a reminiscence of my boyhood in England. The crowds which gather round street amusements often seriously impede the traffic, but nobody ever thinks of interfering with them. In this, as in so many things, the Chinese are a law unto themselves. Their only arbiter is custom, and that is created by public opinion.

Now as to the shops. Except a few of the highest class, where gold and silver work or embroidered, brocaded, and other silks are sold, all the shops are open in front, and the working of the various trades is exposed to public view. All work is done by hand.

The rice-shops are important and many, and in them is seen the process of preparation from husking by means of a primitive stamper until the article is exposed for sale. In the making of bedding (the *mentoi* or thick quilted cotton blankets), the onlooker sees the cotton ginned, and all the stages to the finished article. The ingenious but simple method of equalising the layers of cotton and quilting is worthy of admiration. Space forbids any attempted description; but the *mentoi* never gets 'lumpy,' and experience proclaims them warm and most comfortable beds. The sleeper lies on one side and pulls the rest over him.

Coffin-makers offer an interesting show. The busy workmen are seen sawing, planing, and carving; while around them, stacked against the wall, are a goodly number of the coffins awaiting customers. They range from plain pine to the huge sarcophagus-like and richly carved caskets of camphor-wood, priced up to a thousand dollars. With the Chinese, to make a present of a good coffin to an old man is considered a mark of the highest regard and respect.

In kaleidoscopic review we pass the shops of workers in metals, carpenters, makers of furniture, fans, umbrellas, lanterns, shoes, and the multitudinous articles manufactured from that mainstay of China, the bamboo. From it are made houses, ropes, sails, furniture both decorative and useful, household and kitchen utensils, wearing apparel of several kinds, hats, agricultural implements, paper, musical instruments, carved ornaments, articles of personal adornment, medicine, food, &c. *ad infinitum*. The ubiquity of the bamboo is really astonishing. On the river and on land, indoors and outdoors, from the carrying-pole of the coolie to the bracelet on the wrist of a lady, it is everywhere.

The barbers combine eye-surgery with their special trade, and while the ordinary shaving and queue-dressing are going on others may be seen undergoing some delicate operation upon the eyelids. The Chinese razor, like a butcher's cleaver, is a survival from the Bronze Age, being identical in shape with those dug up from the prehistoric mounds of Denmark.

The shops dealing in second-hand articles are fairly numerous. In delightful confusion are seen cast-off official robes and other clothing, bowls, tea-cups, and vases of china and porcelain (some entire, others cracked), bronze bowls quaintly carved, bronze figures of the most grotesque modelling, old furniture, and odds and ends beyond mention. A foreign collector would revel in strolling about these places, and perhaps secure for a few pence or shillings something that would fetch as many pounds in London. It is in such out-of-the-way places that Chinese buyers from the coastal towns find their most profitable purchases. The present rage for old porcelain has created a demand which cannot be properly supplied, and as a consequence a new industry has come into existence, that of 'faked' ware. The ingenious Chinese are past-masters in the art of 'faking,' and can manufacture 'old' porcelain and 'antique' bronzes in sufficient quantity to meet any demand. Probably not 10 per cent. of the 'old' porcelain so cherished by collectors deserves the title. There is, however, a compensating consolation. As long as the

collector believes his treasure to be old, to him it is so.

Learning being held in the highest estimation as the chiefest ambition in life, it is natural that book-shops are numerous. In addition, there are many bookstalls in quiet corners in the streets, and frequently a pundit may be seen reading aloud to an appreciative audience.

In the autumn and winter fur-shops are well worth an inspection. Coats and other garments made of sheepskin (wool inside) to those made of rare and costly furs hang around in profusion, while piles of skins encumber the floor.

In the goldsmiths' and silk-merchants' shops we reach the highest grade of retail traders. These shops do not expose goods even in the front windows, but any one can enter and look around at his leisure, and no one will ask him to buy. I was entering a silk-shop one day, when, to my surprise, I saw 'camped,' so to speak, on the small vacant space beside the entrance a party of ragged and filthily dirty beggars. I was assailed by whines and cries for alms, and one exposed her limbs covered by fearful and festering sores. I knew better than to take any notice, and inquired afterwards why the shopkeeper allowed them there. Why did he not have them removed? If he attempted to do so a worse state of things would ensue. First sending notice to others, the beggars would invade the shop, squat on the floor, and make the place resound with their cries for charity. In a short time reinforcements would arrive and block the doorway, all business would be suspended, and no other course would be open to the shopkeeper but to purchase release; which being done, the beggars outside would disperse and the original group would go back to their camping-ground outside. The Beggars' Guild is said to be one of the most powerful of the many secret societies of China, and sorrow and loss is the only guerdon one gets for interfering with the exercise of what they consider their legitimate calling.

How is it possible to describe the glories of some of the goods for sale in these shops? In the goldsmiths' shops in tempting array are seen gold and silver laces and lace insertions of marvellous beauty and daintiness; fringes of gold and silver; rings, bracelets, and brooches of quaint designs, all made of pure gold. The method of business differs entirely from that of the European jeweller. When a purchase is made, a price is quoted for the workmanship, then the article is weighed and the value of the gold added.

And the silk-shops! Here more glories meet the eye—costly silks embroidered with gold and silver thread, brocaded silks rich in colour and somewhat boldly patterned, and other silks of gorgeous colouring and varying quality; silk laces and fringes, tassels, caps, fans, and other articles, the whole forming a show worthy of a place in an international exhibition.

The lamp-shops must not be forgotten. Kerosene, of all foreign imports, seems to have captured the public fancy. The trade in it is immense, and shops where only lamps are sold show stocks second to none.

The shops devoted to the sale of food-stuffs form by far the most numerous class, and whether they sell cooked or uncooked food they are the greatest offenders in obstructing the already too narrow footway. It is obvious that small tables upon which are laid trays of sweets and cakes, a cooking apparatus in full work, baskets of fish, vegetables, and fruits, and others upon which lie ducks, fowls, and joints of pork, when placed upon a street eleven or twelve feet wide are serious barriers to free locomotion. Custom with the Chinese is equal in power to a divine mandate, only more so, and to run counter to it is to court disaster. The *taotai* of Shanghai experienced the truth of this not long since. A mandarin of education, large experience, and up-to-date ideas, he saw what a great advantage to his city it would be if he cleared away the obnoxious obstructions in the narrow streets. He issued a decree that no goods were to be exposed for sale outside the shops. A great hubbub occurred, mobs besieged the *taotai's* yamun with cries and yells, and nearly created a serious riot. Petitions were sent to Pekin, and the matter ended in the restoration of the baskets to the footway. The central Government fined the *taotai* several thousand *taels* in addition to all costs, and intimated that it was lucky for him that the rioting was not serious, or he would have lost his head. Reform, being antagonistic to custom, is not looked upon with a favourable eye.

The eating-houses are interesting—when viewed from the outside. As usual, the process of preparing the various foods for sale goes on in a perfectly undisguised manner, the cooks, except in cold weather, being stripped to the waist. The interior presents no attraction to a Western visitor, and so we pass on.

The only places at which a thirst can be quenched are the tea-houses. These are well patronised, and a quarter of an hour can be pleasurably spent in sipping the refreshing beverage and watching the crowd. On taking a seat (if the weather be warm), a 'boy' at once offers you a steaming face-cloth. Though its use is very comforting, I always declined, wondering upon how many faces it had done duty since being washed.

An incident occurred in the city one day which is so thoroughly characteristic of the Chinese that it must be told. To make good a deficit in the city's finances the officials imposed a small tax upon tea; and, notwithstanding the strenuous protests of the tea-men, the *taotai* issued the decree. Next morning every tea-shop

and tea-house was closed; not an ounce of tea or a cup of tea could be purchased in the city. Public feeling was aroused, and the officials were frightened at the impending riot. They temporised, and the tea-men agreed to pay the deficit on condition that a tax upon tea should never again be levied.

Interesting as Chinese cities are to the visitor, they offer no inducement as places of residence to Europeans.

MA'MSELLE.

CHAPTER II.

IT has been said that Mr John Bungay was popular. His popularity was of the kind always commanded by a man of traditional John Bullish proclivities in the age which gave birth to that particular national type. He was a sportsman; he lent his fields for a small race-meeting and for frequent prize-fights; he was cheery, hearty, and outspoken; he hated foreigners in general and Frenchmen in particular. By the officers of the prison garrison he was regarded almost as one of themselves, because his cosy little dinners and his encouragement of sports materially helped them to make the best of an arduous and distasteful service. Captain Heacham had a high opinion of him as a business man, which he himself was not, and was instrumental in obtaining for him the vegetable contract for the prison, so that he was one of the few outsiders who had free entry to the institution.

It is hardly necessary to say that although Heacham had heard the talk about Bungay's unrequited attachment to Ma'mselle, he valued it no more than idle gossip, and never for a moment regarded him as a rival, as in higher circles John Bungay was always regarded, from his apparent indifference to the charms of the other sex, as a confirmed bachelor.

One August afternoon Captain Heacham and John Bungay were strolling round the prison blocks. Some signs of unrest and insubordination had recently been manifest among the prisoners, arising from a racial feeling between the French and an importation of American seamen prisoners who warmly resented being quartered among the dirty and evil-habited foreigners, whom they regarded as little better than wild beasts. The young captain was consulting Bungay concerning the best policy to be pursued, not from any consciousness of weakness on his own part, but from belief in the axiom that two heads are better than one.

A tumult of voices raised in fierce discussion in a distant block made the two men hurry in its direction, but before they could reach the spot the sounds had suddenly ceased.

When they came up, as had half-a-dozen breathless sentries, they saw a strange thing. It was in the particular block which had always borne an ill name as having been one where more violent quarrels and serious duels had taken place than in any other. Here was gathered, around two men who were evidently the principals in the affair, a wild, unkempt, and for the most part half-clad mob of Frenchmen, some armed with sticks and knotted ropes, all breathless with shouting, scuffling, and gesticulation.

Between the two men stood Ma'mselle, erect, with flashing eyes and hands outstretched, pouring forth words evidently of reproach and remonstrance, to which the crowd were listening sullenly, but in silence.

Heacham motioned the soldiers to halt, and with his companion remained in the background.

When the girl had finished, she made the men shake hands, whispered something in the ear of one of them which brought a smile to his face, and came to where Heacham and Bungay were standing. They saluted and asked what had happened.

'These two silly men,' she replied, 'shipmates and hammock neighbours, have quarrelled. One, a Dieppois, and a clever worker in ivory, has built one bone model of a frigate, with the ropes made out of his own hair, which he would sell to-morrow at the market. He accuses the other of stealing it and selling it. Each man has his party of friends, and if I had not come there would have arrived one of two things—a large fight between the two parties or a duel between the two men.'

'And you prevented it!' exclaimed Heacham admiringly.

'Well, I speak them what I thought of them, and for the moment there is peace. But'—— and she shrugged her shoulders expressively.

'Well, Ma'mselle,' said Heacham, 'when they kick me out of this, as they will after the next escape of a prisoner, the best thing the Transport Board can do is to elect you in my place, for I'm blessed if you can't do with a few words what I can only do with a company of soldiers, with fixed bayonets, at my back. And if you go away before then I don't know how things will get on.'

'But I go not away before peace be made,' laughed the girl. 'And now, pardon me, my two hours run like water, and I must yet see two men who have gambled away their hammocks, one man who want to write to his wife at St Malo, and I have to see the hospital, which is busy, too busy, and this stupid thing have

already take a half-hour of my time.' She bowed and tripped away.

'Clever girl that!' said John Bungay presently.

'Clever! She's better than that! She's good! she's noble!' exclaimed his companion warmly.

Bungay raised his eyebrows and looked aslant at Heacham. 'You're in love with her, eh?' he said presently.

'Why, God bless my soul, what a discerning chap you are, Bungay!' exclaimed the young officer, stopping short. 'Now, how on earth did you find that out?'

'Then you admit it?'

'Why, of course I do. But what made you guess it? I've never betrayed it so far as I know. I've kept it to myself, and jolly hard work it has been, I can tell you.'

'My dear Heacham,' said his friend, 'that's just what you should not have done. You've been trying to hide what no man ever succeeded in hiding yet. A man may pass for a gentleman, and be a rascal; a man may pass for a hero, and be a cur; but no man was ever yet really in love who didn't show it somehow.'

'Moping about in moonlight, writing poetry, wearing the hair long, not caring a drumstick for appearance, and all that sort of thing, eh?' said Heacham. 'Well, nobody can say that of me. But look here, I don't want to talk about that. Bungay, you're a chap for whose opinion as a business man I have the greatest respect.'

'You're very kind,' replied Bungay. 'At any rate I'm candid.'

'Well, now,' resumed the young officer, 'supposing—I am only supposing—I, the captain of the war-prison, were to fall in love with, say, Ma'mselle, a girl of the same nation as most of the fellows I have in my charge, who is allowed free access to the prison, and isn't watched or attended in any way, and'——

'Anything were to happen,' put in Bungay, 'such as the escape of an important prisoner'——

'Well, I'm blowed! if you're not the most discerning chap I ever met!' exclaimed Heacham. 'Why, that's the very supposition I was going to make! Well?'

'Well, people would talk about it.'

'Of course they would, girl or no girl.'

'Yes, but not in the same way,' said Bungay.

'You mean they'd think that the girl was at the bottom of it?'

Bungay nodded, but said nothing for a few moments, and was evidently framing how he should say what he was going to say.

'Yes, out with it! I've asked your opinion, old chap, and I'm not afraid to hear it,' broke in Heacham.

'Well,' said his companion, 'I don't want to offend you; but I suppose you're quite sure about Ma'mselle?'

'I am as sure of her as I am of you.'

'Thank you again. You haven't known her very long. You have no proof that she is who she says she is. You'——

'Oh, I say, Bungay, slow down a bit. Remember'——

'There you are, you see,' laughed Bungay. 'I'm only saying what's being said everywhere.'

'That she's not what I think she is or what she says she is? By Jove! if I heard'—— said the young sailor with warmth. Then he checked himself, and, seizing Bungay's hand, continued in a milder tone, 'But when you're as far gone on a girl as I am on Claudine—I mean Ma'mselle—it's hard to hear even your best friend speak of her as—as—well, playing a game. Besides, she's been here now six months. If she'd been playing the sort of game you—I mean people—hint at, don't you think there'd have been an escape by now? Don't you think Andrieux would have been got off?'

'Who's Andrieux?'

'The Wolf they call him. Chap who came into Torbay and cut out a couple of privateers which had been taken only two days before,' replied Heacham. 'The French think no end of him, and have offered to exchange three of our lieutenants if we'll let 'em have him.'

'She's a woman, remember, although in your eyes she has wings and a halo,' laughed Bungay; 'and when a woman takes a thing in hand she can wait far better than a man. Now, don't for a moment think I'm speaking against Ma'mselle in particular, because I'm not.'

'Then it's your candid opinion that I'm running a great risk in thinking of her and treating her as I do?' said Heacham.

'I do—honestly I do!' answered Bungay. 'I admire her as much as you do.'

'Yes, there's a lot of talk about your having proposed to her, and having been rejected,' said his friend.

'Let 'em talk!' exclaimed Bungay. 'Besides, if I had, I'm not captain of the war-prison. Did I ever strike you as the sort of man to—to—well, I was going to say, saddle myself for life with a wife?'

'I can't say you ever did,' replied Heacham, 'and for that reason I never believed it.'

'Just because I came down in the coach with her, and, as she was alone and a stranger, naturally attended to her, and saw her settled at the "Bell," a lot of chattering fools, with no business of their own to attend to, first of all said I was in love with her, and then concocted the story about my rejection!'

'Then you value what people say just as much as I do!' exclaimed the captain. 'I don't believe that Claudine—I mean Ma'mselle—is what people think she is; although I've never heard anybody speak of her in any but terms of admiration and appreciation.'

'Except Miss Mordant!' put in Bungay.

'Oh, she 's nobody. She 's only jealous because her nose is put out of joint at Parthenon House,' said Heacham. 'That reminds me. This afternoon is their big day. Of course you 'll be there?'

'Of course I won't,' replied Bungay. 'I 've something better to do than to go prancing about among a lot of overdressed women, and make myself ill with Miss Wimple's negus. No; I 've some work in the garden which will keep me busy.'

By this time they had reached the prison gates, and so went their different ways.

Among the innovations upon the system of education at Parthenon House which nobody ungifted with the influence of Claudine de Bussy could have brought about was that of associating the school more with the life of the outer world. At first Miss Wimple was aghast at the notion that anything so vitiating and demoralising as the common air of that world should be intruded upon the select and refined atmosphere of Parthenon House. Thereby, she considered, those very principles of selectness and propriety, strict adherence to which, she considered, had brought her school the reputation it enjoyed, would be annihilated. But, as in so many other things, Ma'mselle had her way. She enumerated the advantages which the young ladies must derive from occasional and judicious contact with what was polished and refined in outer society. She urged how their manners, their ideas—nay, their very looks—would be formed and improved by exercise in the presence and company of those who knew what was right; and in a corresponding degree she painted their awkward unpreparedness for the parts they were destined to play in society if they were tumbled into it without any training or practice other than what they got between the walls of Parthenon House and grounds.

And so it came to pass that, in the latter days of August, parents, guardians, and the chief residents in Cabotsbury (the nearest city) and neighbourhood received beautifully written intimations that Miss Wimple and the staff of Parthenon House requested the pleasure of their company on Thursday, 21st August, to an open-air Entertainment (with a big E), and would they please answer?

Parents, guardians, and the chief residents accepted *en masse*. Possibly the daring novelty attracted some; possibly a determination to find fault actuated others; but some idea of the attractiveness of the life at Parthenon House was of course by this time pretty widely spread, and the large majority came prepared for a long afternoon's enjoyment; and, as the weather was beautiful, the scene presented in the gardens, with the large company in its best bib and tucker flitting about, and the sun playing upon a myriad tints and hues, was charming.

Charlie Heacham was there with half-a-dozen officers; but the first-named was not wearing a holiday look, and seemed like one about to face a great ordeal, so unusual with one who was wont to be the life and soul of every social gathering that the doctor rallied him on it.

'Doctor,' whispered Heacham, 'how did you feel just before you asked Mrs O'Shattery to be your wife?' Which made the doctor whistle.

Ma'mselle was, of course, the ruling spirit of the proceedings, although in splendour of appearance she was utterly eclipsed by little Miss Wimple, who was literally ablaze with colour, and all aflutter with feathers and ribbons and a large fan, and all aglitter with chains and charms and lockets and rings.

The good little woman, having yielded the principle of the entertainment, was not one to do things by halves. The band from the depôt at Cabotsbury was there, the leading confectioner of the same city had received *carte blanche* in the matter of refreshments, dozens of seats and chairs and tables had been hired, and quite a score of damsels from Milton and Paxley supplemented the ordinary waiting staff of the house. The little lady, who, it need not be said, had never been to Vauxhall or Ranelagh, was for decorating the grounds after the style of those places of popular resort; but Ma'mselle pleaded so forcibly that the natural beauties of the gardens should be left alone that Miss Wimple yielded with her now usual 'Well, dear, I suppose you know best.'

'And where is your *alter ego* Mr Bungay?' asked Miss Wimple of Captain Heacham.

'Said he was very sorry, but had gardening business to attend to,' replied the young man.

'They say he makes his garden pay surprisingly, and yet it isn't much to look at,' said the mistress.—'Now, Ma'mselle, are we all here—us, I mean—Miss Smithers, Miss Bodkin, Miss Sawney, Miss Mordant? Where 's Miss Mordant? I haven't seen her this afternoon.'

'Playing at gardening with Mr Bungay perhaps—haw! haw!' sniggered a young officer.

'Oh Mr Slingsby, for shame!' said Miss Wimple, tapping him reproachfully with her fan. 'And she 's ten years older than he!'

The band struck up, and the Entertainment began, and Ma'mselle had to fly from Miss Wimple's side to other labours, for the arrangement of the whole affair, from the drilling of the young ladies in their exercises and dances to the choice of their costumes, had rested with her.

There were recitations by the young ladies of the first class; there was a display of calisthenics and exercises, which lost none of their attraction, at any rate in the eyes of the masculine guests, by the fact that the skirts of the performers

had been shortened to a degree which a few months before would have indescribably shocked Miss Wimple's sense of propriety; there were songs and choruses; there was a grand minuet danced by some thirty girls in the dresses and style of the great days of Versailles; there were fencing-bouts; and finally there was the *bonne bouche* of all—the Pastoral Play. The whole affair was an undiluted success; parents, guardians, distinguished residents, including the intending fault-finders, were charmed, amused, and astonished, and united in such hearty applause as perhaps had not been heard in this staid and undemonstrative neighbourhood since a Royal Somebody opened the new pump in Cabotsbury. Loud were the calls for Ma'mselle, but she was nowhere to be found, so the company resignedly dispersed themselves among the refreshment-tables.

The fact is that Ma'mselle had foreseen some sort of demonstration in her honour, and had taken advantage of the company being thoroughly absorbed in the *dénouement* of the play to slip away. Charlie Heacham, who had never taken his eyes off her, swiftly followed; she heard his footsteps behind, turned, and paused, and, as if with some premonition of what was coming, coloured intensely. They walked together to one of those little green-painted, climber-smothered summer-houses still to be seen in old-world gardens.

There, in the fading light of the August day, he told his love in unprefaced sailor-fashion, and, incidentally, what John Bungay had said to him.

'Captain Heacham,' she said after a silence, 'is Mr Bungay what you call "straight"?'

'If there is a straight chap hereabouts it is John Bungay, so far as I know,' replied her wooer.

'So far as you know! But how far is that?' she asked.

'Well, I've had business with him, and I've played cards and had bets with him, and I've no reason to doubt him. Why do you ask?'

'Because I have heard this afternoon once, twice, more than that, things he has said about me being here,' replied the girl.

'What has he said?' asked her lover.

'That I am other than I seem; that in my poor little work among the prisoners I have a very different thing in my mind.'

'Bungay said that! No, no! But I tell you, Claudine, this very afternoon he has told me what people would say if—if they heard that you had made me happy by saying you would be my wife, and then a prisoner—say Captain Andrieux—were to escape. He has never said it himself, because he believes in you just as I do. You have misunderstood people.'

'Well, well,' said the girl, 'that is likely. I hope so. But, Captain Heacham'——

'I am allowed by you to call you Claudine,' interposed her lover. 'You may call me Charlie if you like.'

'Not before you make one answer,' she said. 'Do you truly and honestly believe that I am that which I say I be, and what I seem to be?'

'If I did not believe that, Claudine, if I had the smallest doubt, do you think that I, who have never loved a girl before, would ask you to be my wife, and risk what people would say?' replied the young man.

'No. I believe in you, as you believe in me!' exclaimed Claudine.

'Then'—he seized her hand—'say you will be my wife!'

'Captain Heacham — Charlie! — yes!' she replied.

At that moment the most hateful sound which could afflict the ears of the captain of the war-prison rang out — three gunshots in quick succession, and the clanging of the great prison bell.

Charlie Heacham sprang to his feet, stood for a moment, still holding Claudine's hands, pressed her lips to his, and with the bitter cry, 'An escape!' rushed away.

(To be continued.)

REAL EXPERIENCES ON COLONIAL FARMS.

OUR request for first-hand information regarding daily life on colonial farms (*Chambers's Journal*, September 1911) has met with very considerable response. At present we can only give a selection from those communications dealing with life in Canada and Australia. It was pointed out that in official publications, and in many articles dealing with this subject, difficulties were not mentioned, and much of the information was one-sided, too vague and incomplete to be of practical use. A single man of ordinary intelligence and ability need have little fear of being unable to earn a living in our colonies; but how does it fare with a married man, with his wife and family? What kind of life do women lead? Is it white slavery; and, if so, what are the compensations? A successful settler has said that 'there is no land on earth where one can make an independence for himself easier than in the Canadian West.' But there is hard work and rough life for some years, and much courage, hardihood, and thrift are essential. The woman has often a very great deal to do in making any homestead a success; how does she fare? Some

of our correspondents supply sidelights on this question. There is always an abundant demand in the Colonies for female labour of every kind; and probably women have received less credit for their success in building up our colonial empire than they deserve. In *A Woman in Canada* (W. J. Hans-Smith) Mrs George Cran has set forth a picture of Canada from the woman's point of view.

CANADA—ALBERTA.

Our first correspondent writes:

Life on a homestead! What does it mean?
Washing and cooking from morning till e'en;
'Feeding the brutes' from six-thirty till ten—
Some of them pigs, and some of them men.

Such is my description of woman's life on a homestead, a never-ending round of cooking, washing-up, cleaning, milking, churning, and so on.

Early rising is the rule, which is no joke in winter, with the thermometer at forty degrees below zero, and with bread, milk, and bacon to thaw before you can use them. Man works hard in the North-West, but he eats with a corresponding heartiness, and expects three meat-meals a day. A fat 'beef' killed and cut up on the farm, and then frozen in order to keep, constitutes the winter's supply, while a pig salted down does for summer.

The water from the wells is hard, and frequently full of alkali, not palatable for drinking, which may partly explain the continual tea or coffee at every meal. It is also unsuitable for washing clothes. In winter the clothes freeze as they reach the line, and have to be thawed and dried when brought into the house.

Walking in winter is impossible or nearly so, and driving often more a pain than a pleasure, as you run the risk of frost-bite, and in windy weather the trails get drifted over, and it is difficult to find your way. Life at that season is monotonous in the extreme; outside 'a weary waste of snow,' within 'the daily round, the common task,' the only break a weekly drive to the neighbouring town to get the mail and do necessary household shopping.

BRITISH COLUMBIA.

A well-educated English lady who has gone out to a fruit-farm in British Columbia to assist her brother writes as follows:

The work, as you know, is hard; still, work is good for everybody, and the novelty of the life makes it interesting at first. But it is not all fun. We are living in tents at present, and, unfortunately, this summer we have had a lot of heavy rain; it finds its way through the tents and drips on to the beds.

The cooking-stove is outside, so that on wet days I have to cook in the rain, and on other days often in the hot sun, for there is no shade. We burn wood, which has all to be chopped, and every drop of water has to be carried from a considerable distance. When I wash I carry the clothes up near the flume, our water-supply, and wash there. I never knew the value of conveniences till now. But, on the other hand, there is great charm about an open-air life in a beautiful country.

I do practically everything out of doors when it is not wet. We have a mare which I ride and drive. We are four miles from our nearest town, where I do my shopping, so I drive in every week, sometimes twice, to call for letters and buy in supplies. Of course we have no postman or daily newspapers. I enjoy the riding and driving; but the amusing part of it is that the mare is allowed to range on the hill-side when not in use, and feed on the grass of the hillside behind us. Every time she is wanted she has to be caught; sometimes it takes hours to find her, and sometimes she cannot be found at all. This week I spent nearly two days hunting for her. I was horrified at first at the waste of time; but I am growing philosophical, and if I cannot find her one day I postpone my shopping expedition till the next; if we run short of provisions we just make the best of it.

This is a grand school for patience; but it is very beautiful up behind the fruit-lot among the rocks and the pine-trees, where I hunt for our wandering steed. I obtain pleasure from the walk, even if I do not find her.

The country would be very beautiful if it were not so dry. The soil is like sand, and nothing will grow, except pine-trees and some very scanty grass, without irrigation. We get a lovely view from our fruit-lot looking down into Dog Lake, where I have some delightful bathes.

I have made the acquaintance of three of my neighbours, who are all very friendly; but still the life is necessarily a lonely one. There are a great many days when I see no one but my brother. C. D.

ALBERTA.

I may be able to give you some useful information about home-life in Western Canada. I came from England with my husband and family some years ago, and settled on a ranch in Alberta. I like the life—it is free and unconventional; but I find the work decidedly hard, especially as I was not accustomed to household work in the Old Country. In most towns there are Chinese laundries; but owing to the high charges and the destruction of clothes the washing is generally done at home, and I, in common with other ranchers' wives, often assist in the washing, ironing, &c. I mend all house-linen, and mend and make for the family (seven), and do a good deal of the cooking. All this sounds worse than it really is, as I have every convenience, hot and cold water, gas-stove, and airing-cupboard; but it is still sufficiently arduous. We breakfast at seven o'clock in the summer, and miss the nice

long evening, as it is necessary to get to bed early. The lack of congenial society is a great drawback.

I usually keep a 'help,' but it is not easy to get one who has a good knowledge of housework, and they all expect good wages (from fifteen to twenty dollars a month), even when they have to be taught. Many families come to Canada and live in shacks without any conveniences; for instance, water has to be carried into the house in buckets. This is not so bad in the summer, but means the greatest discomfort when the temperature is below zero. Our house is heated by hot water; this adds greatly to our comfort and lessens the work, my husband or the 'hired man' attending to the furnace, leaving only the kitchen fire to be seen to by the 'help.' QUEEN BEE.

NORTH-WEST ALBERTA.

Mrs Jane G. Smith, after what she saw on a visit in 1909 to the homestead of a married son, felt deeply interested in this great and wonderful land—so vast, lonely, and unpeopled, and with such amazing promise to those who face its difficulties. Edmonton was their nearest city, seventy-six miles distant; the district was without railway or good road, and for supplies the settlers were dependent on a store which stocked groceries, flour, meal, and hardware. Early rising is the order of the day in summer in order to cope with the work, so that all harvesting be finished before the early frost. Breakfast, from seven to eight, may consist of porridge and milk, tea or coffee, bread, butter, bacon, and eggs; the twelve o'clock dinner of bacon, potatoes, vegetables, pies, and puddings. Afternoon tea is served at five o'clock; supper at seven, consisting of tea, bread, jam, stewed fruit, fried potatoes, and bacon.

The duties of the farmer's wife, when she has no hired help, are manifold, and include baking of bread and cakes, and cooking in all its branches. Then there come attention to poultry, butter-making, and housework in general, such as washing, mending, and making clothes. Besides the care of the children and her husband's comfort, she must carefully look after the storeroom, and keep a six months' supply of goods for winter use.

Hundreds of ladies live this life, and are happy and content; and when winter snow covers the ground, and amusement offers, are ready for dance, musical evening, or small social; and often drive fifteen miles and take the children with them, as they could not be left at home. This life is a test of the splendid courage and endurance of many tenderly reared women who find their happiness in helping husbands and brothers in bearing the stress and hardships of a strenuous life, where all are heroes. 'They look well to the ways of their households; and their price is above rubies.'

ON A MANITOBA FARM.

Having kept house, not unsuccessfully, for twenty years on a Manitoba farm, I may say that the chief feature is work: outdoors for a man, indoors for a woman. Her duties are those of a general servant, with the washing done at home, and no washerwoman or charwoman attainable. Bread-making and butter-making are done at home, and the dairy, poultry, often the garden, are usually part of her province.

Modern conveniences do not exist at first. There is no drainage; drinking and cooking water is supplied from a well; and for washing purposes one depends on the rainfall, the well-water generally being too hard.

There is no daily postman. Your letters, and all necessaries and luxuries which cannot be 'grown on the farm,' must be obtained from the nearest little railway 'town,' which may be any distance from two to twelve miles. In these 'towns,' however, one can generally obtain a choice of goods much more varied and much superior to anything one can get in a village of corresponding size at home.

Amusements you must provide for yourselves; there are no libraries, theatres, or picture-galleries on the prairie.

The greatest drawback to farm-life here is its loneliness; every one is too busy for frequent visiting, often too tired with the day's work to walk even half a mile; the roads, also, to unaccustomed feet, are rather rough.

This is not meant to discourage any one. There are many compensations; but in the space allotted it seemed more practical to mention points that, to judge from the remarks one frequently hears from new-comers, are not generally dwelt upon by emigration agencies. J. N. R. T.

NEW BRUNSWICK.

In this province, which is now coming to the front as a fruit-raising country, and where farmlands are easy to obtain and cheap, there are, I think, as few drawbacks and difficulties as are to be met with in any of the maritime provinces of the Dominion, in each of which there are some advantages over the West. These include railway and steamboat communication, good land, an abundance of good water, and a country where there is never a total failure of the crops, and where there are churches and schools everywhere throughout the settled portions of the province within easy reach of all.

But here, as in all new countries, there are drawbacks and difficulties. Those in this province are incidental to those of the other maritime provinces more or less, and arise out of the fact that labour is scarce and dear, owing largely to the call of the West. A settler here —with a wife and, we will suppose, a young family—when he has purchased his farm, will soon discover that pretty nearly all the labour upon it will have to be done by himself. His

farm will probably be one left by a former occupant who has gone west, and he will begin at once, most likely, to discover that much work must be done upon it that was left undone by the former owner. Then he will find that the seasons of seed-time, haying, and harvest, and the ridding his crops of insect pests, are all too short for his purpose without the help he ought to have. The winter, which is long and cold, will follow, when, if he has no timber-land, he will have to live in comparative idleness, or hire out with some lumber-operator. The latter alternative would mean an absence of days, perhaps weeks, from his home, during which time, if a neighbour's boy could not be hired, all the winter work of the farm, such as shovelling paths through the snow to the barn, the milking of the cows, and the care of the stock, besides that of the house and the children, would fall to the lot of the wife. It is not difficult to see from this what the daily life of the woman would be, and it is not exaggerated at all in this paper. Nevertheless, this work has been accomplished frequently in the history of the province, and there are those who have come through it, and are now in comfortable circumstances.

Our immigration agents in the Old Country sometimes present the claims of the Colonies as a home for the settler in too glowing colours. They do not mean, perhaps, to misrepresent, but they are anxious to do all they can of the work for which they are paid, and for the settlement of their particular province, and maybe they do not realise that they are speaking to people to whom colonial ways and business methods are foreign.

H. T.

IN AUSTRALIA.

In Australia it is not difficult for a strong man who is handy, and can drive, and milk cows, to get a position on a farm; his wife too will be welcome provided she can cook and will cheerfully soil her hands with domestic duties in an environment entirely new.

But when she arrives on a farm for the first time she will not see a grand old farmhouse, beautified by age and ivy climbing over its walls, and gravel walks and green lawns spreading before the doorway; just a plain wooden bungalow with a wide veranda and a roof of corrugated iron. To get there she will not go by a spacious, well-made road, but will be driven in a buggy over a more or less rough track, which may include driving through a creek or two. She will meet with hospitality, will be treated with respect, and find plenty to eat, though salted meat may play a leading part on the menu. The furniture will be plain, and there will be no more of it than is necessary; and in the summer flies and mosquitoes may be more plentiful than water.

If she arrives in the summer, probably the grass and trees will look dried up from the heat of the sun, and in the best weather for growth she will seldom see nature attain to more than a tarnished green. For society she will find herself more or less dependent on those living on the farm, since other inhabitants may be some distance away; those with whom she will live will be rough in ways and appearance, but nevertheless jolly and good-hearted.

In the event of a man arriving in Australia with intent to get employment on the land, not only with his wife but with young children, then he will find that the fewer young children he has the quicker he will be in making a start.

The salary will depend greatly on the capabilities of the individuals. Putting it concisely, a man who, though strong, yet has not lived on a farm in England, but desires to do so in Australia, should learn to drive and milk before he leaves this country; and his wife should know how to cook and do the usual domestic duties, while if she happens to have had any experience in teaching, she will find it an advantage if the farmer to whom she goes has a young family.

S. W. C.

WESTERN AUSTRALIA.

I, myself, went out to Western Australia a few years ago, and have spent the most part of my time in the bush there, and have become very familiar with bush-life. In my opinion, it is a grand life either for man or woman, provided one has a natural liking for the country. I was brought up in Edinburgh, and therefore can well understand the difficulties of any one well educated and accustomed to comforts going out to 'settle' in the bush.

Firstly, I may say that it is absolutely necessary that a man should gain some experience in bush-farming—say nine months' experience—before taking his wife and family to live there. Then he will feel sure of himself, and things will go more smoothly in the end. During this period he should have his arrangements made with the Government regarding the selection of land he is to 'take up.' Let us agree that this is done.

The next thing he must see to is his house. Quite a number of immigrants who settle on the land live in tents until things advance somewhat; but for any one who has been accustomed to comforts at home it is advisable to build a house, however tiny. A wooden house of three rooms, with a veranda around, bungalow style, can be put up for about fifty pounds. Once the home is really started the difficulties of a settler's wife are by no means insurmountable, and the compensations for the lack of home-comforts are very many. The house would naturally be an easily kept one. There are no carpets on the floor, no stairs in the house, and not very often fires in the house, except for cooking.

I shall try to tell you as simply as possible the domestic conditions of bush-life, as I know this is an important item.

Food.—Supplies—in the way of flour, meal, sugar, salt, tinned meats, vegetables, fish, and dried fruit—must be bought for two or three months' time, as of course there is no daily marketing in the bush. Plenty of fruit is *essential* in a hot climate. After a time the settler will grow his own fruit and vegetables. Fresh meat, mutton, and an occasional joint of beef can often be procured from any of the neighbouring farmers. Poultry will be found on the premises, as of course every settler keeps fowls for the sake of the eggs and for killing for the household's use. Sometimes, too, if the husband is a good shot, he may bring down a kangaroo, and I can vouch for it myself, however much you may smile, my reader, that stewed kangaroo or kangaroo-tail soup is very tasty indeed. The bread must be made in the house. At first tinned milk may have to be used; but I may say that, after a time, if a cow is kept it will not only be a luxury, but prove a paying venture. These are the principal food items to be thought of.

Fire and Light.—Wood-fires are always used in the bush. After one becomes accustomed to cooking on these one will find them preferable to coal-fires. They are much cleaner, and, beyond the chopping of the wood, cost nothing. Oil-lamps would have to be used.

Laundry.—This, I think, is the most difficult affair to cope with. It is a necessary evil. I may comfort the would-be settler's wife, however, by reminding her that a washing in a climate like West Australia is a very different matter from one at home. The strong sunshine bleaches the linen in no time, and is a splendid purifier. It is not even necessary to use *hot* water for washing; cold may be used instead—an unheard-of thing in the home country.

Education.—A man with a young family going 'outback' will no doubt wonder how the children are to be educated away in this wild bush. In this matter the Government is very good. All school children are allowed to travel free on the railways to school, and if there is not a railway for many miles from their homes a school will be started in the district, provided there are at least fourteen children to attend. This is by no means a bad method of education for a year or two, until a man is making money by his land and can afford to send his children to better schools in the big towns.

I think I have related the biggest troubles and difficulties of bush-life; but now, opposed to these, listen, my reader, to the delights of it. The climate—especially where my home is, in the southern part of West Australia—is glorious. We have day after day of sunshine and blue skies, which make one feel sunny and that it is good to be alive. We forget about all the gloomy, dull days of the home winter. The life is a free and *very* healthy one. Although one lives nicely and dresses nicely—these matters generally depending on the mother—still many of the petty conventionalities of a home city life are dispensed with. Then there are the hours of recreation, when there is plenty of fun, frolic, and laughter. The riding-picnics, for instance, are delightful. We make up a party, each mounted on a horse (every one learns to ride out here), and ride to a creek or the sea, perhaps twenty or thirty miles distant. There we camp for the day, have a swim perhaps, then boil the 'billy' of tea, and have our 'tucker' under the shade of the silver wattle or the eucalyptus gum-trees. We loaf in the heat of the day, and then ride home in the cool of the evening. The dances and concerts are not wanting either. Ah, we are not too serious or dull out in the bush! The spirit of comradeship prevails, and any new-comer is welcomed with open arms. I really think, indeed, that the Australians teach the home-people a lesson in hospitality. Soon, when the settler has begun to make the golden guineas by his land, he and his family will take trips to the cities from time to time to see the shops and theatres. He will enlarge his house and improve matters all round. Again, the owner of a 'station,' as his selection will become through time, has not to worry about the future of his wife and family if he leaves this world before they do, for he knows that every bit of hard work he puts into his land makes it more valuable, and so is insurance-money for them. As the years roll on he will become more prosperous. As he looks from his veranda and sees the smiling wheat-fields all round him, and the forest-land beyond, with which he is still to do much, he will sigh with satisfaction, and peace and contentment will reign over his home.

E. H. T.

THE DONGA'S DREAM.

THE brave old donga, with sides so serried,
And breast laid bare to the brazen skies,
Is dreaming of days when her wounds were buried
'Neath the moederkappjes' quiet eyes.

And spring has hearkened the donga's dreaming,
And dusted her wand of its cobweb sheen;
And softly her shining eyes are gleaming—
Oh sweet Samaritan! Nature's queen!

You will clothe her nakedness with a glory,
And add a touch to her faded tress;
And write on the veld your old-time story
Of Dawn's all-daring deathlessness.

And despairing aloes, forlornly leaning
Their stunted stems to the frowning earth,
Will laugh up their sleeves at the stunted meaning
They caught from the seasons' song of dearth.

And east and west to the far horizon
The green and the gold will glint and gleam.

. . . . . .

What spot in the north will I fix my eyes on
To tell me the tale of the donga's dream?

CHARLOTTE CORDAY.

By the DOWAGER COUNTESS OF DUDLEY.

MARIE ANNE CHARLOTTE CORDAY D'ARMONT was born at St Saturnin near Sées (Orne) on the 27th of July 1768, in a cottage in the parish of Ligneries, situated near the town of Argentan. She was of noble birth, but her family was reduced to great poverty, and lived almost in a state of misery.

Charlotte, who occupied the position of servant in the house of an old aunt, spent her leisure moments in reading and thinking. Her mind was deeply imbued with the new ideas fed by journals and works of philosophy of that period. She read with avidity Jean Jacques Rousseau, Raynal, and Plutarch. She was an enthusiast of true liberty; but she held in abhorrence those tyrants who dishonoured its name and traditions by their excesses. Marat was to her the personification of every crime against humanity and of outrage against liberty.

A foreboding of terror existed in France. The scaffold was already erected in Paris, and very soon was to find its place in all parts of the country. Also it was rumoured that Marat had already drawn up his lists of proscribed persons—two thousand five hundred intended victims at Lyons, three thousand at Marseilles, twenty-eight thousand in Paris, three hundred thousand in Brittany and the Calvados.

In the hope of putting an end to this terrible state of affairs, Charlotte resolved to come to Paris and to rid the world of this cruel tyrant. On the 11th of July 1793 she arrived in Paris, and took a room at the Hôtel de la Providence, 17 Rue des Augustins.

We know of the many difficulties she had to encounter before she succeeded in forcing her way into the presence of Marat, and how finally she accomplished her purpose, and stabbed the tyrant to death in his bath; after which crime she was conducted to the prison of the Abbaye, not without difficulty, as the mob wished to tear her in pieces.

During the several cross-examinations to which Charlotte was subjected she displayed great firmness and courage. She showed no desire to evade the responsibility of the act with which she was charged.

A folded paper was found, pinned to the bodice of her dress, on which was written an exhortation to the French people, which was as follows:

'For how long, most unhappy people of France, are you going to find pleasure in controversy and in trouble? For too long already have scoundrels and agitators been allowed to place their own ambitions and their own interests before the interests of the general public. Why do you, victims of their fury, allow yourselves to be annihilated, so that they may establish their tyranny on the ruins of France? Tumults are breaking out in all parts of the country. The Party of the Mountain are triumphing in crime and oppression. Inhuman monsters, drenched with our blood, direct these detestable plots. We are working for our own destruction with more zeal and energy than we have ever used in the conquest of liberty. People of France, a short time longer, and nothing will remain but the memory of your existence. Already the indignant provincials are marching upon Paris; already the flame of discord and civil war is devastating this vast empire. It is still possible to extinguish it, but you must be prompt! Already that vilest of scoundrels, Marat, whose very name is held in execration for his crimes, has fallen by the avenging steel. Crush the Mountain and make Danton and Robespierre tremble—those other tyrants who have established their supremacy by blood and oppression over the people they have deceived. Frenchmen, you know your enemies! Rouse yourselves! Act! Destroy the power of the Mountain. I know not whether it is our destiny in the future to be ruled by a Republican Government; but, except in vengeance, Providence surely could not inflict upon us a "Mountaineer" as our master. France, our future depends upon the maintenance of law and order! I have not broken the law in killing Marat. Condemned by the world, he is beyond the law. What tribunal will judge me? If I am guilty, then Hercules was guilty when he destroyed monsters. Oh my dear country, your misfortunes wring my heart! I can but offer you my life, and I thank God that I am at liberty to dispose of that. No one will suffer by my death. I shall not imitate Paris (the murderer of Lepelletier de Saint Fargeau) by taking my own life. I wish that my last breath may be of service to my countrymen, and that my head, borne through the streets of Paris, may act as a rallying signal for all friends of law and order, that the tottering power of the Mountain should see the history of

 [*All Rights Reserved.*]

their downfall written in my blood. May I be their last victim, and may the world admit that I have done well for the cause of humanity! If, however, they regard my conduct in another light, it matters little to me. My relations and friends need have no anxiety. No one knew of my intention. I enclose my certificate of baptism and my address, to prove what even the feeblest can accomplish when actuated by a sentiment of absolute self-sacrifice. If I fail in my endeavours, Frenchmen, I have pointed out to you your duty! You know your enemies! Arise, march forward, and strike.'

A letter from Fouquier-Tinville to the Committee of General Safety of the Convention bears witness to the authenticity of this document:

'CITIZENS,—I herewith send you the report of the cross-examination to which the girl Charlotte Corday was subjected, also two letters written by her in the House of Detention, one of which was intended for Barbaroux. As a distorted version of these letters is in everybody's mouth, it may perhaps be advisable to have them printed in full. Therefore, citizens, when you have read them, I shall be much obliged if you will let me know whether you see any objection to this being done. I wish to draw your attention to the fact, of which I have just been informed, that this female assassin was the friend of Colonel Belzunce, who was killed in an insurrection at Caen, and since that time she has conceived a violent hatred to Marat, which was revived by Marat having given information against Biron, who is a relation of Belzunce. Barbaroux appears to have taken advantage of the girl's criminal intentions towards Marat to induce her to commit this horrible assassination. FOUQUIER-TINVILLE.'

Charlotte Corday was confined in a cell and guarded by two gendarmes, who never lost sight of her night or day. From her prison she heard newsvenders in the streets calling out details of her crime and the howls of the mob demanding her head. These cries did not alarm her. She had made the sacrifice of her life, and she had even wished to be killed, unrecognised by the mob, after she had committed the deed. As this was not the case, she foresaw that in the future she would be deified, counting with reason upon the changes which take place in the mind of the populace as in the individual.

She writes, therefore, to the General Committee of Public Safety:

'As I have still a few moments before I die, may I hope, citizens, that you will allow me to have my portrait painted? I wish to leave this souvenir to my friends. Moreover, as the representation of a good citizen is cherished, so also, from a sentiment of curiosity, is that of a criminal sometimes eagerly sought for, to perpetuate the horror of the crime. If, therefore, you will grant my request, I beg of you to send to me to-morrow a miniature-painter. Again I entreat you to allow me to be alone whilst I sleep. I hear incessantly called out in the streets the news of the arrest of Fauchet, my "accomplice." I have never seen Fauchet, with the exception of once from my window. I neither like him nor esteem him, and he is the last man in the world whom I would have taken into my confidence with regard to my intentions. If this declaration is of any use to you, I can testify to its truth.'

Montané, then President of the Revolutionary Tribunal, went the next day to question her. He was extremely kind to her; so much so that, had she allowed him to do so, he would have certified her to be of unsound mind. She was transferred to the Conciergerie, where Madame Richard, the wife of the doorkeeper, treated her with the greatest consideration, and she was allowed to have writing materials. She wrote to Barbaroux all the details of her residence in Paris. She wrote also to her father, reminding him of this line written by Thomas Corneille: '*La crime fait la honte, et non pas l'échafaud.*'

The day after her arrival at the Conciergerie, at eight o'clock in the morning, she was brought before the Revolutionary Tribunal. She arranged with great care her hair and her dress before facing her judges. Richard was present, and she said to him, 'Monsieur Richard, be kind enough to see that my breakfast is ready when I come down again. No doubt my judges are in haste, and I wish to partake of my last meal with Madame Richard and yourself.'

An immense crowd, actuated by diverse sentiments, attended the tribunal of her whom they named later 'The Angel of Assassination.' Her youth, her beauty, her courage, affected deeply those who saw her in the dock. She was not assisted in her defence by the man for whom she had asked—Doulcet Pontecoulant. Unaware that he had not been informed in time, she wrote to him as follows a few minutes before her death:

'Doulcet Pontecoulant is a coward for having refused to defend me when, after all, it was such a simple matter. He who did so acquitted himself with all possible dignity. I shall think of him with gratitude until my last moment on earth. (Signed) MARIE CORDAY.'

Charlotte Corday had begun to write this letter when the executioners entered her cell to conduct her to the scaffold. She asked to be allowed to finish and to seal it.

Doulcet wrote, a few days later, to the editor of the *Republicain Français:*

'CITIZEN,—I read in your journal (page 1015) that I had refused to conduct the official defence of Marie Corday. I beg of you, in the next number of your journal, to be good enough to insert the following letter, which states the fact

that it was not until four days after her execution that I was informed by the Revolutionary Tribunal that I had been chosen by Marie Corday to conduct her defence. GUSTAVE DOULCET.'

It was for this reason—unknown to Charlotte Corday—that when the question was put to her by the President of the Tribunal, 'Have you any one to defend you?' she replied, 'I had asked a friend to undertake this office; but, as I do not see him here, I presume that his courage failed him.'

They gave her, therefore, for her defence, a young counsel appointed by the Court, named Chauveau-Lagarde, well known already by his defence of the Queen and by the courage which he had displayed in several debates. Charlotte examined him with a critical and anxious eye, as if afraid that he might sacrifice his reputation in defending her. Marat's widow sobbed bitterly in giving her evidence against Charlotte Corday, who herself was moved, and, cutting short her deposition, exclaimed, 'Yes, yes! it was I who killed him.' She then proceeded to tell the story of her crime. Three months ago she had formed the project of assassinating Marat at the National Convention. Having failed in this attempt, the pretext she made use of in order to approach him was that she had some important revelations to disclose. 'With great humility, I admit,' she said, 'that the means I employed were unworthy of me; but to reach this man I was forced to appear to esteem him.'

'Who inspired you with this hatred to Marat?' they asked her. 'I had no need of the hatred of others,' she replied; 'I had quite sufficient of my own. Besides, one accomplishes badly any action one has not planned one's self.' 'What was it you hated in him?' 'His crimes.' 'In killing him what did you hope to accomplish?' 'To restore peace to my country.' 'Do you believe, then, that you have killed all the Marats?' 'He dead, the others may perhaps be afraid.'

When the knife with which she committed the deed was shown to her, she made a movement of disgust, saying, 'Yes, I recognise it.'

'With whom did you associate at Caen?' 'With very few people. I knew Larne the municipal officer, and the Curé of Saint Jean.' 'Was it to a priest who had taken the oaths, or to one who had not taken the oaths, that you made confession at Caen?' 'I confessed neither to one nor to the other.' 'When did you first conceive this idea?' 'On the 31st of May, the day on which they arrested here the deputies of the people. I have killed one man in order to save the lives of one hundred thousand. I was a Republican long before the Revolution took place.'

Fouquier-Tinville then resumed the case and demanded sentence of death.

Chauveau-Lagarde said, 'The accused confesses her crime. She admits also that it was premeditated. She admits the most overwhelming evidence. Citizens, that is all her defence. Her attitude of imperturbable calm, complete self-abnegation, and absence of remorse, in the face of death, although sublime in itself, is not natural, and can only be explained by the exaltation of political fanaticism which drove her to commit this crime. It is for you to judge how far the influence of this immovable fanaticism should weigh in her favour in the balance of justice. This I leave to your conscience to decide.'

She was unanimously condemned to death.

When asked whether she had any remarks to make as to the nature of the sentence passed upon her, she remained silent; then, turning to her counsel, she said, 'Sir, you have conducted my defence as I would have wished it to be done. I thank you. I owe you a proof of my gratitude and esteem. I offer you one which is worthy of you. These gentlemen'—pointing to her judges—'have just declared that everything which I possess is confiscated. I owe, in the prison, a small sum. I bequeath this debt to you, to discharge for me.'

A painter who was present at the trial made a rapid sketch of her head. She perceived this, and turned towards him with a smile.

A young man named Adam Lux, a German Republican who had come to Paris to endeavour to combine Revolutionary measures in Mayence with those in France—a great admirer of Charlotte Corday, with whom, however, he was not acquainted—was also present at the trial. His eyes never left her face, and he appeared profoundly impressed by every word which fell from her lips. He excited the attention of those who were present in the tribunal by his comments and exclamations, and he was remarked by Charlotte Corday.

When the sentence of death was pronounced, Adam Lux half-rose in his seat as if to protest against the decision of the judges. Charlotte, surrounded by enemies and absolutely alone, realised at once that she had one sympathetic friend amongst the audience, and she thanked him with a look of gratitude.

Brought back to the Conciergerie, she said to Richard, 'I hoped that we might have breakfasted together once more; but the judges have kept me so long that I must ask you to forgive me for not having kept my promise.'

The artist who had made the sketch of Charlotte Corday in the tribunal was M. Hauer, a painter, and also an officer of the National Guard in the section of the Théâtre Français. He was allowed to enter the cell to finish his work. Charlotte conversed with him about his art, his family, and her crime. She begged M. Hauer to send a portrait of her to her parents, and gave him a lock of her hair, which she cut herself with the scissors lent to her by the executioner.

A priest was introduced into her cell. She

said to him, 'I do not require your services. The blood which I have shed, and my blood which is about to be shed, are the sacrifices which I offer to God.'

When the executioner cut off her hair she picked it up and gave it to Madame Richard. Her hands were then bound and she was dressed in the red garment of the condemned. She remarked with a smile, 'My death-toilet has been made by somewhat rough hands, but it is my last before I appear in the presence of God.'

A violent storm broke out as the tumbril conducted her to the place of execution; but the torrents of rain and the lightning did not disperse the howling mob. Her wet dress, clinging closely to her form, revealed the beauty of its outline. Her erect head, lovely colouring and eyes, and her sweet and sublime smile excited involuntary murmurs of admiration, mingled with the howls and ribald execrations of the mob. Danton, Robespierre, and Camille Desmoulins were present to see her pass. Adam Lux waited for the tumbril at the entrance of the Rue St Honoré, and followed it to the foot of the scaffold.

On arriving at the place of execution, Charlotte descended from the tumbril without assistance, and mounted the steps of the scaffold. She crimsoned with shame and anger when the executioner rudely tore from her shoulders the muslin cape she wore, leaving exposed her beautiful white neck and bosom, but she quickly regained her self-control and placed her head under the axe.

An assistant of the executioner named Legros seized the severed head with one hand and struck it on the face with the other. The cheek was said to have blushed with the blow, as if her dignity still survived though life was extinct. Exclamations of horror and cries for vengeance for this outrage burst from the vile crowd surrounding the scaffold. Even these blood-thirsty, hardened monsters had been for once impressed by the beauty and splendid heroism of this young girl.

A few days after the execution, Adam Lux published the pamphlet which he entitled *The Apology of Charlotte Corday*. He was arrested, imprisoned in the Abbaye, condemned to death, and executed. As he passed out of the prison on his way to the place of execution he said, 'I rejoice that I am dying for her sake.'

André Chénier, Klopstock, and other poets dedicated poems to her memory; and Vergniaud, hearing in his prison the story of the crime, the judgment, and the death of Charlotte Corday, exclaimed, 'She is the cause of our deaths, but she has taught us how to die.'

THE CAHUSAC MYSTERY.

CHAPTER XIV.—FACE TO FACE.

A COMPLETE stillness had fallen upon the room. Cahusac walked forward. No one could tell how much he had heard, and his face gave no sign. He passed slowly through the room, amidst a hush of vivid and intense expectancy.

Many of those present hoped for some dramatic dénouement on the spot. It was quite possible that Puyfot had told his story in expectation of the Englishman's arrival at the significant moment. There was a look about Cahusac which promised well for a strong, even a tragic, development.

Puyfot had, with the true instinct of the reptile, obliterated himself amongst a group of the smaller fry of journalism. Cahusac's inscrutable eyes ran rapidly over one face and another until they fell upon De Sarsan's. He stopped opposite to him. He said nothing, but the sudden set of his figure and the tightening of the muscles about his jaw were suggestive. The coldness of the man had flashed suddenly into elemental passion, fierce though silent.

De Sarsan was in reality a little thrown off his balance at the totally unexpected entrance of Cahusac on the scene. He allowed this agitation to appear; it could be explained afterwards in so satisfactory a manner as an outbreak of friendly feeling, when the suggestive story set afloat by Puyfot should have gone out upon the great sea of the daily papers. He stood up, and bowing with deference to Cahusac, said, 'Good-evening, monsieur. I am proud to welcome you to Paris.'

Cahusac returned the salute coldly. 'It appears that Paris does me the honour to speak of me,' he answered with a slight glance round, then turned and moved with his companions to a vacant table.

The hubbub reigned again. De Sarsan began a discussion upon modern British art in his usual brilliant manner. The general talk swung on; the diners commenced to move about, and in the slight bustle Puyfot made opportunity to get Wilford out of the way. This accomplished, De Sarsan felt more at ease. Three men at least were racing off notes for the morrow; he had aimed at publicity and had hit the bull's-eye. In the morning the story of Malcolm Cahusac would be common property in Paris; the day after, of the world.

Cahusac, with Detching and Huson, were chatting together; but Detching could not avoid noticing that most of the men present were furtively watching himself and his two friends. He scowled irrepressibly. It was at this instant

that his red-bearded face caught Gorascon's roving eye.

'*Ma foi*, De Sarsan!' he said, 'Puyfot spoke of the devil, and behold him! But here are devils of both colours, red and black, equally difficult to exorcise, in my opinion. Regard the little one, I pray you!'

De Sarsan darted a glance at Detching. Yes, he had seen the man long ago; his keen memory told him as much; but the link which should have fixed the position in the past was still missing. This troubled De Sarsan the more since he rarely forgot. Then his attention passed on to Cahusac, who was smoking a cigarette over a glass of liqueur. The young man's aspect of cold passivity gave him a shock in spite of himself. It is expedient, even at times interesting, to destroy a man's reputation and soil his honour; but when one happens to deal with persons of cold-blooded resolution the issue of events cannot be forecast with any certainty. Composure under a severe mental strain was emphasised in Cahusac's case by his air of distinction, and this in turn hardened to an appearance of remorselessness which struck De Sarsan unpleasantly, until he reminded himself that Cahusac would presently be discredited in the face of the world, while he himself possessed the doubly valuable position of being a powerful yet an unknown enemy.

People were coming in and going out. The time of new laughter and more piquant stories was just passing, to be succeeded by the still later period of the still more pungent stories and the loudest laughter. Huson had pointed out one and another of the celebrities to his companions, adding characteristic anecdotes.

'A man's name is likely to be handsomely treated by some of this company!' remarked Detching grimly.

'You are thinking of Cahusac?' Huson shrugged his shoulders. 'We shall know more about that to-morrow.'

'Monsieur Cahusac, I should like a word with you in private. I may be able to render you a service.'

Cahusac looked round in surprise. De Sarsan was leaning on the back of Huson's chair and regarding him with a grave face.

'I am at your disposal,' Cahusac replied; and after a few words with Detching, he rose and followed De Sarsan from the room.

Outside it was bitterly cold and a little snow was falling. The Belgian walked on a few paces in silence before he spoke. 'You heard your name pronounced in there?' with a significant gesture over his shoulder.

A sudden premonition struck Cahusac. He foresaw evil. 'May I ask what was said?'

De Sarsan hesitated. 'Something of Park Lane and—and—an attempted suicide.'

Cahusac steadied his voice with an effort. 'Suicide?' he said. 'Who spoke of it?'

'Puyfot, a purveyor of garbage for *L'Œil*, a literary *chiffonnier* who lives on the filthy rags he gathers.'

'An old acquaintance of yours, monsieur!' Cahusac stated a fact rather than put a question, but in a manner entirely without offence.

De Sarsan replied with some bitterness, '*Mon Dieu*, yes! for many years when things went less favourably with me than they do now. His address is here.' He offered a card to Cahusac.

Cahusac drew up at once upon the pavement, and faced his companion.

'What is your object in—this?' he asked. The directness of the look and the words would have discomposed most men; but De Sarsan was ready.

'There are questions between us, monsieur, which do not bear open discussion. Because I am your rival in one direction I am not necessarily your enemy in another,' he answered with grave dignity. 'My motives for action to-night are no doubt as mixed and unworthy as most human motives are; perhaps the chief one which prompted me was the fact that you have already suspected me. Good-night.'

Cahusac walked away in the opposite direction, feeling like a man half-drunk, helpless, stupefied. He strode on for a considerable time before he remembered that the quarter of Paris named on the card lay at a distance. The check had the physical effect of rousing him thoroughly. The absorbed misery of the last half-hour fell from him; he became alert, keen, resolute, his normal self. There was something still left to be done, something still to hope for. He might be in time to delay the publication of this Puyfot's knowledge.

With a burning impatience he endured the drive in a *fiacre*. The old, ramshackle house, deep in its hidden street, was still alive and awake. The *concierge* was voluble; but Cahusac, not listening to more than the first directions, passed on up the stair. He mounted slowly, counting the stories until he paused at the indicated door. The landing was dark; something scurried across the floor—one could imagine the ancient boarding a lair of vermin; snores issued from an adjoining room; the clink of broken glass echoed oddly from below; windows rattled forlornly in the stormy wind; dominating all, not by its loudness but another quality as of keen suffering, a strange sound like a death-battle for breath grated on Cahusac's ears. He waited.

Inside Puyfot's room the panting was now intermixed with a thin voice which uttered sentences brokenly. It grew louder and more connected.

Cahusac knocked, but no answer came. He opened the door, and was met by the musty smell of a much-lived-in room. He paused, and the words, before indistinct, now became clear.

In the middle of the floor stood Puyfot, his eyes away from the door. To the unheeding

walls he was giving the speech of Astoreth's human lover. There was no goddess and no glory; but the man was lost in the passion of his dream. His voice rang on and on, bearing him with each sentence nearer to exultation. It was one of his dreams of the angels. A moment or two later he had fallen, gasping, against the table, wrestling for breath. 'France! France! will my voice ever reach your ears? No one aids me; none even hears me! They laugh at me, but they will not believe that I, Puyfot, have ever written lines such as these!'

Cahusac could not bear the sound of strained sobbing. He stepped forward. 'Pardon me,' he began by a happy inspiration; 'I have just heard some great lines.'

Puyfot looked up, still fighting for breath. 'Look at me!' he cried wildly. 'Genius is mine, and those rare gifts which make life worth living to other men. But I—I am dumb; poverty came upon me in my youth, and cut out my tongue! I have sinned against myself. Look at me—hopeless, feverish, starving, condemned to vice! Ulpien Puyfot has another reputation than the one he has yearned for—ay, and earned.' He stopped, shook back his head like a man after a plunge in water, and, staring at Cahusac, spoke more calmly. 'What do you wish of me, monsieur?'

Cahusac knew that the success of his errand depended much on diplomacy, though there was something loathsome to him about the puny, black-bearded poet.

'I think you know me. My name is Cahusac, and I have taken the liberty of coming here in the hope of securing your help.'

'I am at your service absolutely,' returned the other man. But in his heart he felt satisfaction that it was in his power—in his, Puyfot's, the poor, the degraded, the physically weak — to crush this tall Englishman, with his manifest strength of body and of mind.

Cahusac considered, put his foot abstractedly on a still burning cigarette-end, and broke straight into the heart of his subject. 'Some articles have been appearing of late in a paper called *L'Œil* about former and present officials of the British Foreign Office. Some of these cast aspersions on the memory of an honourable man. I understand you are connected with this paper. Can you help me to find out the writer, that I may prove to him the falseness of his information?'

'Bah!' returned Puyfot carelessly, 'what of that? After all, Truth is not the titular deity of Paris, and frequently, monsieur, a lie is infinitely more amusing than the truth.'

'But a lie that kills'—— began Cahusac.

Puyfot went on. 'Why not go direct to the editor? The office is open,' he suggested.

Cahusac smiled. 'I am in earnest,' he said.

'So?' Puyfot waited, as if expecting more light to be thrown on a difficult subject.

'In fact, I was led to believe that you could tell me who wrote the articles in question.'

'I cannot tell you.'

'Is that final? I am ready to buy the information.'

'You have done me the honour to come unasked to visit me,' replied the other. 'It is easy to see that I am poor. I prefer to remain so!'

'Understand me, monsieur,' replied Cahusac; 'many of the paragraphs are direct and ruinous attacks upon a dead man's honour. You spoke just now of helplessness, of injustice, of ruin; will you not give your help to another in the same straits? I am fully aware that these attacks are prompted by some influential person who has a purpose of his own to serve. Tell me, therefore, only the name of the man who is behind the man with the pen.'

'I cannot tell you,' Puyfot repeated; but Cahusac could see he was growing excited under the spur of talking. His eyes were ominously alight.

Cahusac took a rapid decision. He said, 'I have learned something since I came into this room.'

'In that case, as I can be of no service to you, you will be good enough to relieve me of your presence,' sneered Puyfot.

Cahusac pointed to the single table, on which lay a sheet of proofs in the print peculiar to *L'Œil*. 'I have long sight. I can read my name there. I am not bribing you, monsieur; I am paying, and am ready to pay, a heavy price.'

Puyfot met the appeal with a derisive lip. 'Your honour is doubtless dear to you, monsieur; but, unhappily, my honour is engaged elsewhere.'

'Surely your honour would lead you to sympathise with a man in my position. These lying statements concern my father, Malcolm Cahusac. I swear to you that you have been deceived. I swear they are false. You have already spread abroad many hints and innuendos. Have you no desire to give the whole matter a fair hearing before it is too late?'

Puyfot shrugged his shoulders and looked curiously at Cahusac, who continued, 'You are destroying my father's reputation, blasting the good name of a dead man. Do you not shrink from that? It counts far less that you are injuring me beyond hope of recovery.'

'Monsieur,' replied Puyfot in a high voice, 'your career is of absolutely no moment to me; and, since your father is dead, his reputation can be of absolutely no moment to him.'

Cahusac snatched up the proofs from the table. 'I can at least oblige you to cease these slanderous attacks.'

Puyfot seemed about to spring at him, but thought better of it. He leaned across the table, and his peaked face worked with passion.

'What do you *know* about your father's death?' he asked, then paused. 'Shall I tell you?' He

snapped his fingers in Cahusac's face. 'Nothing —nothing!'

Cahusac looked down at him. 'You are mistaken,' he said. 'I do know.'

'Bah! I repeat it—nothing, nothing! But what would you say if I told you that I, Ulpien Puyfot, know your father's affair as I know the palm of my own hand.'

'You! You are not forty, and he has been dead over twenty years.'

'True. Yet when you were a child I was a youth.'

Cahusac was about to speak, but Puyfot went on, 'So you will best serve your interests by leaving me in peace. You cannot force me to divulge to you more than I desire. You are helpless, Monsieur Malcolm Cahusac, son of Malcolm Cahusac!'

The malignant, blazing black eyes mocked the young man. He took a hasty step forward. 'I could kill you?' he exclaimed.

'Ha, ha, ha! Of what use would that be?' shrieked Puyfot. 'In a few hours the papers will be selling your story in the streets! It was I who used your name to-night, I who told your story in detail at "Les Corbeaux" to-night! You comprehend?'

The news struck Malcolm like a blow upon the heart. He knew himself baffled and defeated by Fate. He had appeared at 'Les Corbeaux' too late—only a few minutes too late—as once before he had been too late. Had he reached Park Lane one day earlier he must have secured the letters which would have saved him. There was no more to do now. He turned and groped his way down to the street, followed by the screams of Puyfot's discordant laughter.

(To be continued.)

MODERN WHALING BY NORWEGIANS.

By H. J. Bull.

Christiania, *December* 1911.

IT was in 1865 that Captain Svend Foyn commenced the first whale-fishery from Finmarken, in the north of Norway. Having previously acquired a considerable fortune through seal-fishing in the Arctic, he was enabled to wage his war against the large finned whales which at that period congregated in great numbers on the coasts of northern Norway. It took Captain Foyn, however, several years of hard and unsuccessful labour before, in 1868, he finally succeeded in bringing his harpoon-gun to such perfection that his many experiments at last turned his work into a large and profitable industrial trade, which very soon found followers amongst his countrymen, so that in 1886–87 no fewer than thirty-four steam-whalers belonging to different companies were engaged in whaling.

The small whaling-steamer introduced by Captain Foyn was provided with a so-called harpoon-gun fixed in the bow of the boat. A bombshell was attached to the outer end of the harpoon, which, by an ingenious mechanism, was caused to explode as soon as it entered the body of the whale. If hit in its vital parts the whale would be killed instantly; if only hit in the more fleshy parts it might take some time before the animal was finally killed by lances, or —as is usual at present—by winching in the whale and giving him a new shot. The size of the steam-whalers has gradually increased so as to enable them to tackle the stormy weather and high seas prevalent on the more distant whaling-fields, and the steam-whaler of to-day reaches a length of ninety to one hundred and ten feet, with a width of eighteen to twenty-one, and a draught of eleven to twelve feet, and speeds along at a rate of from ten to thirteen knots on a coal-consumption of five tons per day. The crew consists of the harpoon-gunner—who usually also acts as the captain—the mate, an engineer, firemen, and others—in all, ten or eleven men.

For the utilisation of the whale and its products large stations or establishments were built ashore. As soon as they were killed in the open sea the animals were tugged into these places and taken in hand by the shore-labourers, who 'flensed' off the blubber, that was tried-out by steam and turned into oil in large digesters specially constructed for the purpose. Afterwards the flesh—containing, of course, a considerable quantity of fatty substance—was cut off and boiled, the fat converted into oil of a somewhat inferior quality than that obtained from the blubber, and finally the boiled meat and the big bones were ground into guano; so that at a well-found establishment no particle of the whale's carcass went to waste.

The great destruction of the whales on the northern coasts of Norway, and the consequent decrease in their number, had gradually roused the animosity of the large body of fishermen in that part of the country. The fishermen held the opinion that the presence of the whales was necessary in order to chase the large shoals of cod-fish and herrings into the bays and fjords, and perhaps to make the fish approach the coast, so as to give the poor fishermen a chance of reaching them. If the whales were destroyed, the fish, in their opinion, would not come near enough to the land, and the fishermen would consequently be left to starve. Foolish, undoubtedly, as were these arguments, the complaints from fishermen, greatly supported by political agitators, were nevertheless received

with apparently good faith by our Storthing, and towards the end of the nineties one of the most remarkable laws of the century was passed, prohibiting Norwegian citizens from killing whales on the coasts of Norway.

In the early part of the eighties the attention of Norwegians was, however, drawn to the large number of whales in the waters around the Faroe Isles and Iceland. Whaling establishments similar to those in Norway were therefore erected in several parts of these islands, where for a number of years good profits have been made from the whale-fisheries. Some years later Norwegians were again extending the business to Spitzbergen, the Shetlands, the Hebrides, and the west coast of Ireland, and at all of these places whale-fishing is still going on with generally good results to the shareholders. The species of whales usually caught in these northern waters are the fin whale (*Balænoptera musculus*), the blue whale (*Balænoptera sibbaldii*), the fish whale (*Balænoptera borealis*), and the humpback (*Megaptera boops*). In Iceland, the Faroe Isles, the Shetlands, the Hebrides, and on the Irish coast a few 'right' whales, the so-called 'North Capes' (*Balæna biscayensis*), and also a few sperm whales (*Physeter macrocephalus*), have annually been caught.

The idea of fishing for whale in the southern waters originated in Norway in 1893, that year Captain Foyn fitting out the steam-whaler *Antarctic*, formerly engaged in the Arctic seal-fishery. The plan was to look for the 'right' whale of the South Seas, approaching the Greenland whale (*Balæna mysticetus*) in value on account of its precious whalebone, so well known in commercial circles. The *Antarctic* went as far south as the seventy-fourth degree, without, however, discovering a single 'right' whale, but meeting with large numbers of the finned whale species. For further information regarding this expedition, see my book, *The Cruise of the Antarctic* (London, 1896), treating the subject in detail.

About the same time Norwegian sealing-vessels were sent out to the Antarctic regions south of Cape Horn, and all reported on the immense number of finned whales, particularly the humpbacks, which had been seen in different parts of the Southern Hemisphere.

These reports ultimately led to the establishment of a whaling-station at South Georgia in 1904. The company owning this station consists of Buenos Aires financiers; but it is managed by a Norwegian whaling-captain, who was the originator and organiser of the whole concern. The brilliant success of the company, and the manager's reports of the thousands of whales to be seen at only a small distance from the shore, created quite a sensation amongst enterprising men in Norway, who were not slow to follow in the wake of their countryman, and whaling in southern waters is at present carried on by Norwegians, not only at South Georgia, but also at the Falklands, the South Shetlands, the South Orkneys, on the coast of Chili, south and west coasts of Africa, and Kerguelen Island.

The singularly rapid development of the whale-fisheries in the south will more readily be understood by comparing the output from the fields in the north for the last few years:

	World's Total Production.	Proportion from the North.
1906 . .	78,000 barrels.	73% or 57,000 barrels.
1907 . .	127,000 "	58% " 74,000 "
1908 . .	150,000 "	41% " 62,000 "
1909 . .	229,000 "	31% " 72,000 "
1910 . .	309,000 "	19% " 58,000 "

Of the 1910 production, 103,000 barrels came from South Georgia, 44,000 from South Shetland, and 40,000 from South Africa—187,000 barrels. The balance of some 120,000 barrels may be attributed to the whale-fisheries in the north and in South American waters. (One barrel equals 40 gallons, six barrels being roughly reckoned equal to one ton of 2240 pounds.)

In the foregoing statistics the Japanese whale-fisheries are not taken into account. It may be presumed, however, that the produce of whale-oil from that country is of small importance, as the greater part of the whale is used for food by the Japanese.

I have already mentioned that establishments ashore were built in Norway and other northern countries from the early days of the whale-fisheries. The difficulty of finding convenient harbours in some of the southern places, the necessity of bringing the cargoes home from the whaling-fields, and other circumstances made it all-important that a substitute for the shore-establishments should be found if the whaling industry so far from home was to be profitably carried on by the many companies. To overcome these difficulties the so-called 'floating factories' were introduced. A floating factory means an old steamer of three to four thousand tons, a size which has annually been increased, so that the new companies under formation are speaking of boats of eight to nine thousand tons dead-weight capacity. By using the larger size of steamers the owners are able to fit them with plant not only for trying out the blubber, as in the smaller-sized boats, but also with plant for turning the carcasses into oil and guano just in the same way as in a well-found establishment ashore, thereby utilising all parts of the valuable animal. It is of great economic interest that no products of the whale should go to waste.

If, for instance, you have plant on board for treating the fat carcass, after the blubber is removed you will obtain an extra output of what is called the meat-oil, amounting to from 30 to 35 per cent. more than is obtained when the blubber only is utilised; and then there is, in

addition, the guano. These different complete plants require, of course, a greater outlay of money, but the considerably larger returns make it evident that the extra money is a good and profitable investment. The price of the somewhat inferior meat-oil may be calculated to be about 20 per cent. less than the best oil from the blubber.

The present price of guano is about £7 per ton. If we suppose a whale will yield five tons of blubber-oil, the value of this oil alone would be (at £20 per ton) £100; but with plant for treating the carcass on board the extra output would be one and two-thirds tons of meat-oil (at £16), £26, 13s. 4d.; and four tons of guano (at £7), £28—in fact, an addition of more than 50 per cent. to the value obtained when the blubber alone is utilised and the remains thrown away.

It stands to reason, however, that if whales are somewhat plentiful all the year round, a shore-establishment is preferable to a floating factory, where there are always some difficulties to contend with in the treatment and utilisation of the huge animals which you do not have at a shore-establishment. The later years' experience in southern waters, and the knowledge that whales are seen during the greater part of the year in many places, have therefore had the result that several shore-establishments have lately been built at South Georgia, the Falklands, and on the coast of Chili.

[Since the above was written, the New York *Outlook* asks if, with the extension of new methods of whale-hunting by Americans, the whale may not be in danger of extinction. Within two years eight steel steamers armed with powerful machine-guns have begun to hunt the whales of the North Pacific, and five additional steam-whalers are now under construction. These vessels are primarily destroyers; they do not try out the oil as the old whalers did, but kill the whales with explosive shells, and then tow the carcasses to a central station, where the work of getting out the oil and whalebone is done on a large scale.]

M A'M S E L L E.

CHAPTER III.

MISS MORDANT had not been gardening with John Bungay as the young sub had mischievously suggested, but had gone in to Milton to see a friend, Mrs Smee, at the post-office. The friendship was not an old one, but was one of those spontaneous outbursts of open-heartedness characteristic of such an emotional young person as a properly constituted teacher of literature might be expected to be; and to an outsider, who marked the contrast between the snuffy, mumbling, bespectacled Mrs Smee and the alert, quick-talking, smartly dressed schoolmistress, it was at first sight unaccountable. But in truth it was a methodical friendship in more senses than one. It was methodical inasmuch as it was just now politic for Miss Mordant to be on friendly terms with Mrs Smee, and it was methodical because Miss Mordant's visits were invariably timed to within half-an-hour of the arrival of the principal London mail of the day.

So, at just about the time when the Pastoral Play was in full swing at Parthenon House, in came Miss Mordant to the half-shop, half-office which served as the local post-office. She came in hot and panting as if with hasty walking, and sank into a chair as she cheerily greeted Mrs Smee, who was sorting the letters just arrived by the London coach.

'Lor', miss!' exclaimed the post-mistress, 'if it wasn't takin' a liberty, I would say come in an' take a cup o' tea, for you look as if you was wore-out.'

'Well now, that is kind of you!' replied her visitor. 'I don't know but what I will accept your offer; but finish your business first. What a lot of letters to-day!'

'Yes. Folk seem to 'ave a lot o' spare time on their 'ands!' said Mrs Smee, and went on mumbling, according to habit, the names of each person to whom letters were addressed.

'Farmer Bumble—two; that's about 'is gell w'at's goin' to marry young Wattle. Parson—one, two, three; 'e gets a sight o' letters, surely. Bill Stakes, Mr Bungay, Mrs 'Opkins—an' she can't read! The "Bell"—one, two, three, four. Mr Bungay—one, two, 'eavy uns. The "Bell" again. Captain Heacham—one, two, three, four officials. Lieutenant Slingsby, Lieutenant Corker, the Doctor, Mr Bungay again—a 'eavy un. 'E do get a lot, to be sure; an' it must cost 'im a bit, for they ain't often paid. Feel it, miss!'

Miss Mordant took the letter. It had the Brighton, Sussex, stamp on it, but it was evidently from abroad by the characters of the address and the texture of the paper. 'Brighton!' she said off-handedly.

'Yes. 'Is in general come from Brighton, or Lynn, or Dover, or Cabotsbury, or some o' 'em seafarin' places,' replied the old woman. 'Business letters, I reckon, most on 'em, an' wi' money in 'em sometimes, when they 're paid afore'and. Now, Mr Bungay would be the man for a certain young lady as I knows on as shall be nameless. They do say as 'ow 'e could keep 'is carriage if 'e chose!'

Miss Mordant's already suffused face assumed

a deeper tinge, but she merely said, quite carelessly, 'Well, of course it 's no business of mine; but I suppose Mr Bungay generally sends for his letters?'

'Not 'e, miss! 'E don't trust everybody wi' 'is letters,' replied Mrs Smee. 'In general I sends my granddarter Susan wi' 'em, 'cos 'e knows she 's a sort o' post official like; but she 's away at Miss Wimple's a-'elpin' to wait an' wash-up, so I 'll just keep 'em till 'e comes 'isself, which won't be yet awhile, as 'e 's sure to be wi' all the grand folk; an' when you comes in 'ere I says to myself, I says, "Whathever is Miss Mordant adoin' away from the great goin's-on, an' Mr Bungay there?" but, la! my tongue do run away sometimes; but people will come in 'ere, bein' in a sort o' way a Government office, an' not once nor twice 'ave I 'eard it said what a pity—— Captain Heacham—one; Doctor O'Shattery—two'——

And so she mumbled on until she had disposed of the contents of the mail-bag, and invited Miss Mordant to step into the back-parlour for tea.

'They do say as 'ow that Marmselle is as good as mistress over there at the school,' said Mrs Smee as she poured out the refreshment. 'Well, she 's a tidy-lookin' wench for a furriner, which I can't say in general I takes to.'

'Yes, she 's a clever woman,' replied Miss Mordant dryly.

'And they say it 's wonnerful 'ow she deals wi' them prisiners,' continued Mrs Smee. 'You don't take a little drop o' something extry wi' your tea, miss? I 'm obliged to. Bein' in the Government sarvice makes it tryin' to the throat.'

Miss Mordant declined the something with which her hostess liberally 'laced' her tea, and observed, 'Yes, they 'll find out her cleverness one of those fine days.'

'Why, miss? You don't mean—ah! about 'er an' the captain!' said the old woman. 'Well, in general, I don't agree with hus marryin' furriners.'

'Oh, I don't mean that!' said Miss Mordant. 'Hark! That means another escape.'

This as the sound of the guns and alarm-bell broke the stillness of the afternoon world. Miss Mordant, evidently so pleased at an excuse for escaping from the company of her entertainer that she could not repress its expression on her face, jumped up and hurried out into the street, which, but a couple of minutes before silent and deserted, was now dotted with people either hurrying in the direction of the prison or gathering in groups to chatter.

Not ten yards from the post-office she met Mr John Bungay, evidently coming for his letters. He would have passed on with a formal salute, but she stopped and said, 'Oh Mr Bungay, that means another escape, doesn't it?'

'Yes, Miss Mordant, I 'm afraid it does,' he replied. 'Poor old Heacham! It 'll go hard with him this time.'

'Do you mean to say that you are sorry for him?' said Miss Mordant.

There was something in the young woman's tone as she made this remark which made him pause in his reply. Then, with a laugh which had no heartiness in it, he said, 'Please don't look at me! I know I 'm not fit to be seen; but I have had a hard afternoon in the garden, and I didn't expect to meet anybody I knew while all the world is at Parthenon House. But about poor old Heacham. I am sorry for him. I should think I was! He 's the best friend I have in the world. This will mean, I fear, that he will have to go. How is it you are not at the entertainment?'

'Like you, I have other things to do,' replied the lady coldly.

She passed on, and Mr Bungay went in for his letters.

The Transport Board held a court of inquiry upon the recent escapes from the war-prison. Captain Heacham's simple defence was that all that was possible was done to prevent escape, and that he could do no more. The commissioners spent a long afternoon in examining the prison and its surroundings. They found nothing in the defences or in the system of guard-mounting to find fault with, and the only conclusion they could arrive at—which was suggested by John Bungay, who had been called in by Captain Heacham as a witness on the strength of his having access to the prison in his capacity as a contractor—was that the escapes were planned and carried out from outside.

Then what Heacham had most dreaded came about. In reply to the question, 'Is anybody unconnected with the service of the prison allowed under any circumstances to pass within the gates?' he had to admit the daily presence of Ma'mselle. 'But,' he added, 'I am ready to pledge my honour as an officer and a gentleman that she knows nothing about the escapes.'

Then was elicited the fact that between him and the French girl there existed an attachment of the tenderest nature. Whereupon the old salts wagged their heads knowingly, and one of them murmured, '*Churchy le fumme.*'

Witnesses testified to the great good which Ma'mselle wrought among the prisoners, and quoted instances of mutiny and disturbance being checked by her influence; but it was agreed that for the future she should be excluded.

Asked his own opinion, Heacham said that the only occasions when it was remotely possible that a prisoner could escape was at the market held twice a week at the prison gate, when countrymen were allowed to buy and sell with the prisoners.

'Abolish them, then!' said the president of the court.

'It will produce mutiny,' said Heacham.

'Then double your guards, and don't hesitate to use steel and ball-cartridge,' was the rejoinder.

The commissioners retired to consider their decision. When they reassembled they announced that although Captain Heacham was responsible for what had occurred, there was no evidence that it was due to negligence on his part. That the prisoners who had escaped were invariably men of position and value seemed to confirm the suspicion that there was collusion with outside. They formally reprimanded Captain Heacham, but warned him that the next escape would mean very much more serious consequences to him.

That evening Heacham told Claudine of the court's decision that she was no longer to be admitted to the prison.

The blow was a terrible one for the poor girl; but she simply bowed her head and accepted her fate. 'Charlie,' she said, 'for your sake I must bear it. I cannot be surprised that the Board should look at my presence with suspicion. My chief sorrow is for the poor men. I was just getting them under perfect control; and now I fear things will be worse than before, especially as the market is to be abolished.'

'But you will not go away, Claudine?' said her lover pleadingly.

'No, not if Miss Wimple will allow me to remain,' she replied.

'That I am sure she will!' said the young man. 'If you left I would not stay.'

Very differently did the prisoners at Staple Cross receive the news that their *Sainte Demoiselle* was no more to come among them, and, further, that the only opportunity given them of improving their condition and of employing their enforced leisure was to be taken from them by the abolition of the markets. Indignation meetings were held in all the prison blocks, defiant speeches were made, and mutinous songs were sung. A sentry who lost his temper and wounded a man with his bayonet was half-killed. Captain Heacham, although personally popular, and known by the cooler-headed to have had no hand in the obnoxious ordinances, was openly reviled and insulted. It was necessary to send to Cabotsbury one night for an additional company of soldiers; a desperate attempt was made to fire the prison, and in the resulting confusion a score of prisoners escaped, and another score were killed and wounded. It was impossible that such a state of things could be allowed to continue; so, after a hurried council at headquarters, it was decided that it should be represented to the Transport Board that unless concessions were made the prison authorities could no longer hold themselves responsible for what six thousand desperate men would do.

The reply came that the market might be re-established, but under the most elaborate restrictions. This somewhat soothed the stirred passions; but the majority of the prisoners, for whom the market had no attractions, clamoured for the restoration of their *Sainte Demoiselle*.

Time passed on, 1813 gave way to 1814, and matters at Staple Cross seemed to have settled down. Claudine remained at Miss Wimple's, but the good little schoolmistress saw with concern that, except when she was in her lover's company, she was no longer the bright spirit of past days, for daily she heard that since her prohibition the condition of the prisoners was morally and physically drifting back to its old state. The only person who seemed to regard the state of affairs as satisfactory was Miss Mordant.

This lady, who, since it was evident that John Bungay cared nothing for her, had posed as an embittered being, seemed to revive and assume a new self as the clouds gathered darker around Captain Heacham and Claudine. She no longer withdrew herself from amusement and social intercourse; she no longer spent her leisure time in solitary mopings and wanderings beneath moon and stars, in confiding her sorrows to the nightingales which loved the belt of trees opposite the prison burial-field, but was alert and joyous, and seemed to aim at occupying a position in the estimation and affection of all similar to that filled by Ma'mselle.

Miss Wimple, who could not bear that anybody should be unhappy under her roof, rejoiced much in the change which had come over her English literature mistress, ascribed it to her good sense in reconciling herself to the inevitable, and congratulated her. She went further, and more than hinted that, as at no remote period she might give up the duties of schoolkeeping, it might be that Miss Mordant would be offered the vacancy.

But when Miss Mordant, with some acerbity, replied that the prospect of a life of maidenhood, even allied with the right of calling herself mistress of Parthenon House, had no charms for her, Miss Wimple came to the natural conclusion that affairs between Selene Mordant and John Bungay had been mended, and would have been shocked beyond expression had she known of what a very different nature was the reason for Miss Mordant's change of demeanour.

It may be imagined how utterly quiet and uneventful were the last months of 1813 and the first weeks of 1814, when a chief topic of conversation over the garden gates and at the firesides of Milton village during this period was the alteration which had taken place in Mrs Smee's personal appearance, how she had burst forth in a glory of raiment unknown to her before, and how she had actually gone to church three Sundays in succession — a performance she had never been guilty of when she was the

plainly attired, not to say slovenly, Mrs Smee of past years.

But, as usual, the calm was but the precursor of stirring events. Enough has been said to show how improbable it was that the relationship between Claudine and Miss Mordant at Parthenon House could be cordial. The fault had certainly not been with the former, for, like Miss Wimple, she was unhappy with any unhappiness around her, and she had done all in her power consistent with her dignity as a well-born young Frenchwoman to gain the heart of her soured fellow-teacher. Finding it useless, Claudine had simply left her alone.

Judge, then, her surprise when, late one afternoon in February, Miss Mordant approached her in Milton with a beaming face, and said, 'Mademoiselle, I have good news for you. You have a brother who is a captain in the French service, have you not?'

'Yes—yes!' replied Claudine impatiently. 'What of him?'

'You will see him shortly,' said Miss Mordant.

'I shall see him! See Gaston! Impossible!' exclaimed Claudine. 'What do you mean?'

'He is on his way here,' replied Miss Mordant.

'Then, has peace been made?' asked Claudine.

'Oh dear no! He has been taken prisoner.'

For a moment Claudine clenched her little fist, and only by the strongest of efforts did she restrain the impulse within her to strike the grinning, big-toothed mouth of the miserable little tormentor before her. But she did restrain it, and stammered, 'And you call that good news—that my Gaston, the pride of his service, he after whom your most famous captains have been panting all these years, and who is worth any two of them'——

'Including Captain Heacham?' sneered Miss Mordant, but in a second changed her tone, for there came an expression on the face of the French girl she had never seen before, which cowed her, and she added mildly, 'Listen. I mean what I say. It is good news; but you naturally cannot see why. I have no particular reason to love you, but I hate some one else ten times worse, and I tell you the capture of your brother will be a good thing for you—and for me, mind you—*and for me!*' With which she went on her way, actually humming a tune, and leaving Claudine standing like one petrified, murmuring, 'Gaston a prisoner! Gaston a prisoner! She means something when she says it is a good thing! What can it be?'

The bi-weekly market would ordinarily have been held at the prison gate the next day; but a notice, signed by the governor, which was posted up early in each of the blocks announced that it was postponed until the day after. The latest arrivals in the prison knew not the significance of this; but the old hands, who did, said nothing, immediately hurrying off to occupy the few points whence a view could be obtained of the main entrance and of the path leading thereto from the Cabotsbury road, so that roof-openings and walls were presently dotted with tangled heads surmounting fierce, eager faces; and the rest, who soon learned that an arrival of fresh prisoners was hourly expected, had to content themselves with animated speculations as to the chance of there being old messmates and comrades among the new-comers.

The outside public had heard the news, and, familiar as the scene was to it, was gathering by the roadside, and as near the prison as it was allowed, to witness the sad procession. In the crowd stood Claudine. She had not seen Charlie Heacham since Miss Mordant had told her the 'good news,' and when she spied him coming out from the gate in full uniform, evidently looking for her, she shrank behind a burly countryman.

Presently the clear notes of a bugle rang out in the still morning air. The sharp command, 'Guard, turn out!' was heard; the soldiers in full *tenue* fell in, fixed bayonets, and rapidly and silently lined each side of the pathway. All heads were turned in the direction of Cabotsbury, and soon, in a cloud of dust, the head of the procession appeared. Claudine, in her intense anxiety, strained forward, so that her human shield turned and courteously made way for her in the front.

The captives passed slowly by with their red-coated guardians—a few proud, erect veterans with the bronze of Spanish sun still on their cheeks, looking straight ahead of them; a few still wearing the jaunty sailor air; but the large majority poor, sad-faced wretches, many in rags and barefooted, many limping and in evident suffering; gray-haired men and mere striplings—all silent, until a roar of '*Vive l'Empereur! Vive la France!*' from the occupants of the prison roused the lustiest among them to some sort of response. And then—midway in the column, one whose appearance extorted from Claudine a frantic 'Gascon! Gascon!'—a tall, well-built young man in a worn and tattered naval uniform, his head bandaged, and his arm in a sling. He stopped short, and looked in the direction whence the cry came, saw Claudine, and would have left the ranks to embrace her, but his militiaman guard pushed him on, and he passed under the fatal portal.

(*To be continued.*)

THE HOSTS OF A TRAMP.

By the Author of *Leaves from the Diary of a Tramp.*

MUCH has been written by amateur tramps who 'pad the hoof' warmly clad, with knapsack on back—and a cheque-book in the knapsack—of the joys of the open road. There was little of joy for me during my life on the road; for when I commenced it was not in obedience to the call of the wild, but in search of work. I have hungered often; I have slept out in haystacks, corn-fields, by the roadside; I have slept in casual-ward dormitories, in the outhouses of farms (when the dogs have been chained up), and in the shavings in a joiner's workshop. Tramp-life to me was prosaic indeed. I lacked the imagination that would tinge the ordinary happenings of the road with romance. The moments I can with pleasure live over again as I think of it all are the moments when the beauty of human sympathy lit up the dreary road for me, when kindly men and women acted as my hosts—and I a tramp!

On the first occasion I had been tramping two days without food, through Worcester, Tewkesbury, and Gloucester. The evening of the second day I began to wonder where I could spend the night, for I was too footsore and tired to walk much farther without rest, and I remembered that I had passed a haystack about two miles outside Gloucester. I tramped wearily back until I found it again, and soon I was over the fence and into the hay. When I awoke it was broad daylight, and hurriedly I sprang to the ground—right into the arms of a policeman!

He asked me first what I was doing there—rather an unnecessary question that—then proceeded to put me through a catechism: What my work was. How had I lost it? How long had I been on the road? Why didn't I sleep in a casual ward? And as I answered his questions straightforwardly, and produced testimonials, his manner became more kind. Then abruptly he asked me, 'How long is it since you had anything to eat?' I told him that also. Then, after a moment's thought, he said, 'I ought to take you to the station—sleeping in a haystack 's against the law—but I won't. You 're not that sort, I can see. I 'm off duty in half-an-hour. You walk along with me, and then we 'll have something to eat.' I left him a few minutes later while he met his sergeant, and then together we went to a neat little cottage, and very soon I was seated at a table with a pint of steaming coffee, bread-and-butter, and eggs before me. I was famishing, and my kindly host plied me with food until I grew ashamed of my appetite. Then, after a rest and an enjoyable whiff of the constable's tobacco, I took my leave, my pockets filled with food and my ears full of good wishes which were uttered with a heartiness and sincerity that brought tears to my eyes. As I shook hands with my host he said with a twinkle in his eyes, 'Next time you sleep in a haystack cover up your feet. I saw them as I passed, and was just going to fetch you off when you came off to me.'

I went back to Gloucester and spent the day trying to get a job, without success. Then I tramped on to Hereford. It was noon when I arrived there, and I went from shop to shop trying to get a job of any kind. Towards evening I went into a large shop opposite a very old-fashioned timbered house on an island site, and the man who came to me spoke very kindly, unlike the majority, who seem to act on the supposition that a man on tramp is necessarily a wrong un. But he couldn't find me work, not even the smallest odd job. And so I turned to go. I was just closing the door when he called me back. There were tears in his eyes.

'My boy,' he said, 'it makes my heart ache to see you. It must be awful tramping about. But I 've got the bailiffs in, and soon I may be like you. But if you 'll sit down I can give you something to eat at any rate.' And he brought me a big plate of bread and meat and vegetables.

'It 's all I can give you,' he said; 'but you are welcome to it. It will help to keep your strength up.'

And I thanked him not only for what he had done, but for his will to serve me had only the way been clear.

Whether he went down or won clear of his difficulties I know not, for I left Hereford that night. It was also in the west I met my next host. I had been tramping for hours on a beautiful day through a very beautiful country-side; but I had no eyes for its beauties, for I was consumed with thirst. Tramps usually are, I suppose the natural thought will be; but I opine I am an exception, for I have never tasted any intoxicating drink. My father's wish, for he persuaded me to pledge myself when very young. Anyhow, I was thirsty, and I could find no stream where I could get a drink.

At a bend in the lane along which I was tramping I came upon a dainty, fragile old lady, standing at the gate of a garden surrounding a pretty, creeper-clad house; and, plucking up courage, I asked for a glass of water—the only thing I begged the whole time I was on the road. 'Water!' she said. 'No, not water. I feel too sorry for all the poor men who are looking for work to offer you that. Will you come inside, and my maid will make you a cup of tea? I am sure you need it.'

She took me into the house—not, as I expected, into the kitchen, but into the quaint,

old-world dining-room; and, though the servant brought food into the room, she herself waited upon me—to the servant's evident disgust—treating me and talking to me not as a tramp, but as an honoured guest. I tried to thank her, but she would not allow me.

'I had a son, and had he lived, and his need were great as yours, I should have wished for some mother to have helped him, if I couldn't do it myself. I am old,' she added, 'and you won't mind my saying this. Remember always, if your mother is alive, her heart will be aching for her boy, and don't lose hope and so go down altogether.'

My last host was in the bleak Rhondda Valley, when I was tramping throughout the night, lacking the coppers that would have enabled me to hire a bed. Several times I tried to get to sleep by the roadside, but in vain, and at last I gave up the attempt. When I reached Porth the principal street was 'up,' and before a watchman's cabin there was a brazier heaped high with red-hot coke. I hurried towards it, and soon the grateful warmth was penetrating my chilled body. The watchman, a cheerful-looking old man with a chronic smile, welcomed me, making me a seat by placing a board across the upturned ends of two water-pipes. Then he boiled some water in a can and made about a quart of cocoa. When that was ready he pulled out a basket generously supplied with provisions, and invited me to join him. I refused, for I thought that by helping me he would have to go short himself. 'Take it, lad,' he said. 'If I tried to eat it all myself I'd choke—and I'd deserve to.'

These hosts—the hosts of a travel-stained tramp—were very different in externals, yet alike in the kindness of their hearts; and I shall always remember them with gratitude.

THE COURAGE OF AH FU.

IT is, I think, Baron de Marbot who tells us that the bravest man he ever knew was a certain French general who invariably rode into battle white and trembling, placed himself in the forefront of the fight, leading his troops with dash and prudence, and never for a moment permitted his almost overmastering terror to cloud the acuteness of his brain or to mar the brilliance of his combinations. This is, of course, the finest and truest form of courage, the mastery of will-power over a physical disability engendered by mental disquietude, and may be considered as a thing apart from the purely physical courage latent in most men, that periodically finds its outlet in isolated acts of splendid daring, compelling the admiration of all onlookers.

Careful examination induces the belief that courage is, on the whole, greatly a question of habitude and circumstance, with, as a concomitant, a knowledge more or less accurate of the existing danger. In other words, familiarity with a certain class of danger, if not exactly breeding the proverbial contempt of it, at least strips it of half its terrors, and permits of a boldness of action that to the uninitiated may sometimes seem to partake of undue rashness. But given a totally unaccustomed form of danger, and in nine cases out of ten the action will become timid or assuredly less vigorous than the circumstances might well warrant. Again, much more fortitude is required to face valiantly a danger unseen, and consequently but partially understood, than to face a danger of whose approach one is cognisant. Every soldier knows the difficulties of retreat; how, once the back is turned on pressing peril, even the steadiest nerves are liable to sudden panic, and how often only the bonds of a discipline previously so carefully inculcated as to have become almost mechanical can succeed in holding men in hand. This is especially noticeable in uncivilised races; once get a savage on the run and he will seldom stop till the immediate sense of danger is past. So it was with Ah Fu.

Ah Fu was a Hakka coolie, big, broad-shouldered, with the light-yellow skin and quaintly slanting eyes so characteristic of the southern Chinaman, and a lovely long pigtail at once his joy and his curse, so much of his spare time seemed to be of necessity employed in washing, oiling, and plaiting it, and on joss-days adding to its length and beauty by cunningly twisting into it strings of silk of varied colours as the observance of the religious occasion required. He belonged to a tribe inhabiting *pyloong* or pirate villages on the lower slopes of the Ta-Ma-Shan range, hardy fellows inured to work and privation, of no great character for common honesty, and ready to mix themselves up in any robbery, piracy, fight, broil, or turmoil that might be going, so long as they were in sufficient strength easily to outnumber their opponents and so make success certain. When not engaged in any of the foregoing pleasing amusements many of them employed their spare time in tiger-hunting, following their dangerous prey up the long cave-riddled valleys till they found his resting-place; then, lighting immense torches, they daringly crept in and with their spears despatched the beast in his own den. To the inexperienced this sounds mad folly, but in reality it is by no means so dangerous as it seems, because in most cases the tiger, blinded by the bright light, hides his head in the nearest hole and allows himself to be peacefully slaughtered. I have actually known some of these

plucky men, when sent out to find a tiger for a 'foreign devil' to shoot, follow one into its cave, build a stout bamboo cage round it, and then calmly return to tell their employer they had a safe shot for him.

In everyday life Ah Fu filled the humble though onerous position of leading man of my team of chair-coolies; but whenever a shooting expedition was arranged his sporting instincts made him beg to accompany it, and a right useful follower he many a time proved himself. On one of these occasions we got on the track of what is known as a wandering tiger—that is, one that frequents no fixed locality, but nightly moves to fresh quarters—and a very nice dance he led us. Right along the base of the hills for six days from village to village we followed him, finding where he had killed, lain up for a few hours, and then moved on again, till, after hard travelling, we arrived within a couple of miles of the coast. Here the trail turned away at right angles, leading up a long, narrow, rock-bound valley that ran apparently straight into the heart of the mountains. Wearily we toiled upwards, the rocks gradually closing in tightly on either hand till we could only progress by clambering along the bed of the central stream where the great footprints were still visible half in and half out of the water. A few hundred yards of this climbing brought us to the head of the gully and face to face with a small cave in the rocky cliff that barred farther advance. At the bottom of this was a rock-edged pool of water in which the tracks were lost; but, as no means of egress were possible, it looked as if we had literally run our quarry to earth.

Ready, rifle in hand, I backed away from the cave as far as space would permit, debating in my mind the best course now to pursue, when, to my surprise and alarm, I saw Ah Fu, with nothing in his hand but a short bamboo, calmly cross the pool, drop on his hands and knees, and crawl slowly into the hole. I shouted to him to come back, but in vain; he crept quietly in, while I, with beating heart, stood gazing at the place of his disappearance, momentarily expecting to hear the sounds of a fatal scuffle within. But no dreadful sounds issued, and soon the villain came creeping unconcernedly out, only grinning at the abuse I plentifully heaped upon him, and saying, 'Allee light, my no fear; inside nothing have got.' Whether anything 'had got' inside or not, I had no intention of making further personal inquiries at such close quarters; so, giving the tiger up as another 'bad job,' we retraced our steps toward the coast, making for a small village that lay about a mile from the place where we had turned into the mountains, and where we hoped to glean further information regarding the animal's doings.

Now, this part of the coastline is notorious for the constant smuggling that occurs on it; therefore, at certain points along it, especially where the entrance to a hill-pass gives means of access to the *pyloong* villages, the Chinese authorities have established small *lekin* or Customs posts, usually guarded by four or five men of the Imperial Customs service, and just outside the village we came on one of them. The 'station' was a small log-hut built about one hundred yards from the cliffs that barred all access except to the gully I had descended and to a larger one a little to the south, through which a path led to some of the *pyloong* villages—a path up which many a package of smuggled opium had at various times found its way. The immediate countryside was densely covered by scrub and brushwood; but from the hut to the cliff a space about sixty yards in width had been thoroughly cleared, and this space was completely commanded by a low crenellated wall a few feet from the hut, which served as a fort to the Customs men.

Of course I stopped to 'pass the time of day' with the officer in charge, and was listening to a long tale of men and pigs—with the callousness of a Chinaman, he made so little distinction between them that at times it was difficult to know to which he alluded—that had been killed and carried off from the various surrounding villages, when one of the Customs men came running up from the direction of the shore, shouting out something I did not understand, but which had immediate effect on his comrades, who instantly dashed into the hut, seized their rifles, and quickly threw themselves down behind the little mud-fort. At the same time the valiant Ah Fu plucked at my coat, calling, 'Master, come quick!' and, setting the example, bolted at his best pace.

My acquaintance with Chinese habits and language being at that time somewhat limited, I did not at first fully grasp the import of these happenings. But as some sort of shooting appeared imminent, I was not going to be left out of it; so, turning rapidly, I grasped Ah Fu by his most prominent point—his pet pigtail—and, checking him for an instant, wrenched the rifle from him. One sharp struggle and he was again free, leaving his prided silk embellishment in my hand. Doubtless the amount of hair that accompanied it caused the piercing scream with which he departed.

All this was the affair of a moment, but ere I could turn round events had moved. Out of the brushwood ran a company of armed men, of whom about a dozen had firearms of diverse kinds; the others, some twenty or so, carried in their right hands the common Chinese three-pronged spear, while on the left shoulder was balanced a bamboo pole from both ends of which depended a heavy package of opium. With astonishing accuracy and celerity the riflemen spread themselves out as a covering-party, hiding behind every little tuft and stone that was available, and rapidly bringing their weapons to

bear on our small party. There was no room for me behind the mud-wall, so I had to make the best of a slender tree for cover, which prominent position gave me the unsolicited honour of seeing every barrel turned in my direction. This was no pleasant sight; for, being the only 'foreign devil' present, it was obvious I dared not fire the first shot, and so must bear the brunt of the greater part of the imminent volley before sending a bullet in reply.

Meanwhile the opium-carriers were racing their booty across the clearing towards the hill-path, which, once gained, would place them in safety, and I continued shouting to the Customs officer to fire and stop them, without, however, eliciting more than a muttered reply till the path was almost reached, when, under the lash of my tongue, he gave the order, and there came the sharp click of four useless rifles. Not a cartridge had they between them! Forgetfulness, he said, but deliberate policy, I am inclined to believe, had left them all in the log-house. Then, with the same rapidity and precision they had shown in advance, the covering riflemen withdrew in the wake of their comrades, and in those few minutes many hundred pounds' worth of opium had been cleverly smuggled under our very noses. I was too disgusted to speak, so set off in search of my valiant follower, whom I eventually found, green and shivering with fear, lying in a wet ditch quite a mile from the scene of action. How could I blame him? I had funked the tiger's cave, he didn't; it was his *pidgin* (business). He funked the fight and left it to me; it was my *pidgin*. Nothing could be more simple to his mind. And, after all, who was to say which of us was the greater coward? But in future expeditions I took good care to keep Ah Fu within the groove of his experience.

It only remains to add that some weeks later the superintendent of Imperial Customs received a report of a desperate fight with smugglers that had taken place, on a date not mentioned, at that particular post, in which many had been killed and wounded, though unfortunately the opium had escaped capture. Possibly those four Customs men still pose as heroes of a bloody battle. I didn't give them away. Or perhaps it was another fight as serious as the last. With a Chinaman, who can tell?

THE GOLDEN TROUT.

THE British fisherman who would catch the golden trout must be possessed of a heavy purse and the patience born of travelling; good lungs and sturdy limbs he must also possess to reach the home of the golden fish.

There is only one stream in the world where they can be obtained. It flows in the heart of the high sierras in a remote and almost inaccessible region of Kern County, California. California, famous for her unique possessions, surely has none more unique than this. Volcano Creek, apt name for the home of this flaming fish, is a tributary of Kern River; rising from Cirque Peak, a few miles south of Mount Whitney, it flows in a series of rapids and cascades to the high falls of Aqua Bonita, and into Kern River. Through volcanic action the stream became inaccessible to the trout of the ordinary species in Kern River. The fish in Volcano Creek, preferring the cooler, clearer waters of their own stream, became segregated and in time formed a tribe by themselves, assimilating the colour of their habitat. They run from six to twelve inches in length, with small scales, a deep orange on the belly, golden yellow of singularly beautiful sheen on the back, and a wavy golden wash on the sides. Stewart Edward White, the well-known American hunter and author, aptly likens them to a twenty-dollar gold coin fresh from the Mint.

The stream is narrow, the banks lofty and steep, and in the high wind that prevails accurate casting is attended with considerable difficulty. The angler has to be careful to keep out of sight, as the fish are shy and easily alarmed, the crystal clearness of the water enabling them to detect the slightest movement on his part—a combination of circumstances that should appeal to the interest and sporting instincts of the fisherman. The fish take the fly readily, and if he keeps the above directions in mind he will make a very satisfactory catch in a few hours.

The angler who would make the trip has a choice of three or four routes, the most popular being from Visalia by stage to Three Rivers, thirty miles, and from thence to Mineral King, also by stage, which will occupy one day. Here he will have to engage a guide, with pack and saddle animals, to take him and his impedimenta over the mountain trails, which are devious and steep, to his destination. The scenery is unsurpassed, and alone will amply repay him, if he be a lover of nature, for the fatigue and expense of the trip.

INSPIRATION.

WHEN I have been by heavy cares oppressed,
With gloomy bodings of approaching ill,
When melancholy broods within my breast,
And failure thwarts the utmost of my will,
I turn to simple things—the woods, the flowers,
The voices of the children in their play,
To find that in this complex world of ours
Is yet enshrined the plenitude of May.
So, gathering courage from this glimpse of life,
I plunge anew into its ceaseless strife.

THE HEART OF THINGS.

By Henry Leach.

London, *Yesterday.*

CHINA has begun her change, and the rest of the world may look on for a long number of years at an interesting process of vaster significance than anything of the kind that has ever before happened. That is certain; the change is now inevitable, since it has begun; and the overwhelming importance of the results to the whole world is just as inevitable. Here is a country which in its own self embraces nearly two millions of square miles, and with its outlying parts over four millions, with a population of over four hundred millions. These people, not of a considerable inferiority in race, have been sleeping, dozing, and lagging behind in their civilisation for hundreds and hundreds of years while the rest of the world has been marching forward; now they are awakening. Forces are brought to bear which rouse them to action. They realise that they are weary of their present form of existence, and are desirous to become equal with the best civilisation. Over four hundred millions of yellow men are about to be prepared for a great advance. They have much to do before they will be ready. Perhaps it may be difficult for Europeans to comprehend that in the far north of China at the present time there are millions of people dwelling in caves. They will come out, and slowly, gradually, but surely they will bring themselves into line with Western civilisation. It will take long, but by no means so long as it would have taken if the beginning had been made two or three centuries since, for this process of civilisation is one that, like everything else, is more quickly carried out in these days. There is the strange case of Japan; and China may even be quicker than Japan. This is an exceedingly serious business; it is a proper use of words to say that it is terribly serious. Before the end of last year Dr Sun Yat Sen was proclaimed provisional president of the Chinese Republic, that republic not being quite an entity; and what will come of that first movement remains to be seen. But the comedies and ironies of life and history are very strange, for this Chinese doctor, a keen-looking man of some forty-five years of age, born and living as a Christian, was some sixteen years ago shut up in the Chinese legation in London, a prisoner whose fate was uncertain, but not very hopeful. When he was released, virtually by the command of Lord Salisbury, a price of fifty thousand pounds was placed upon his head, for it was known that he had dreams of a new China, and was a dangerous revolutionary disturbing to the peace of the Manchu throne and of the sleeping millions. He had but a little while before organised a plot to seize Canton, but this was a plot that failed. Since then he has been in many parts of the world, organising the Chinese revolutionary forces, and collecting money for the great enterprise that was afoot. In the autumn of last year he was in the United States; later he was in England; afterwards he took ship from Marseilles to China. Always his movements were quiet and stealthy. His manner and demeanour are modest; he makes no speeches. He trusts to simple arguments and facts, and those who have had some relations with Sun Yat Sen say there is that about him which makes him a great leader of men.

* * *

I remember that when Sir Robert Hart, who died last year, came home from China some four years ago, having spent about fifty years in the country, he expressed some optimistic views upon the subject of the 'yellow peril,' as we have called it, and must continue to do so. He said that the Chinese were not aggressive, and that they regarded armies as objectionable; but the events of the last fifty or sixty years had made it necessary for them to take defensive measures. Sir Robert had concluded then that, in the sense of military aggression, there was no danger, no 'yellow peril.' Yet there were four hundred millions of people, and China was bound to become a powerful nation. The real 'yellow peril' would not be military but industrial, as the Chinese could live so much more cheaply than other people, and for that and other reasons their competition would be of a most dangerous kind. So he said. Here, in passing, I should like to repeat a little story of an odd experience that Sir Robert told at the annual dinner of the Savage Club three years since. He was telling us that there were some Chinese institutions which he admired immensely. Many years previously he had been bidden to a Chinese dinner-party, and on arrival at the house of the host he and his fellow-guests were conducted up the stairs to a room in which forty or fifty young

 [*All Rights Reserved.*]

ladies were seated on sofas, each guest being told to pick out two of these young ladies to pour out wine for him. This was done accordingly; whereupon the two little damsels he had chosen for his service trotted down and sat on each side of him and poured out the wine. He found them to be very lively companions; they played the guitar, and they sang most excellently. That particular entertainment began at twelve o'clock noon and ended at five the next morning, having lasted seventeen hours. There were a hundred and twenty-five courses, and Sir Robert, resolved to be the good guest, tasted all of them!

* * *

However, at this very serious moment in the affairs of the East, when we wonder and fear, and the 'yellow peril' is looking to be a more fearsome thing than such optimists as Sir Robert Hart made it out to be, one may find some most entertaining and enlightening statements and expressions of opinion in a book that has just been written by Professor E. A. Ross on *The Changing Chinese*. He has gathered all his facts himself from all over the Chinese Empire, and some strange word-pictures does he present to us. He contends that we do not understand the Chinese, but that they are not so difficult to understand as most of us seem to think. He shows us how hideously all but 1 per cent. of these 'celestials' live. The overpopulation of many parts is terrible, and the evils resulting from it are appalling. 'Here,' says Professor Ross, 'are people with standards unquestionably civilised—peaceable, industrious, filial, polite, faithful in their contracts, heedful of the rights of others; yet their lives are dreary and squalid, for most of their margins have been swept into the hopper for the production of population. Two coarse blue cotton garments clothe them. In summer the children go naked, and the men strip to the waist. Thatched mud hut, no chimney, smoke-blackened walls, unglazed windows, rude, unpainted stools, a grimy table, a dirt floor where the pig and the fowls dispute for scraps, for bed a mud *kang* with a frazzled mat on it. No woods, grass, or flowers; no wood floors, carpets, curtains, wall-paper, tablecloths, or ornaments; no books, pictures, newspapers, or musical instruments; no sports or amusements; few festivals or social gatherings. But everywhere children, naked, sprawling, squirming, crawling, tumbling in the dust—the one possession of which the poorest family has an abundance, and to which other possessions and interests are fanatically sacrificed.' All this is the state of affairs when the death-rate is between fifty and fifty-five per thousand. In a few years, when a good Government is well established and many reforms are carried out, that death-rate should be brought down to twenty, and probably the birth-rate will remain at forty. What then? Professor Ross declares that the Chinese must emigrate or starve, and it would seem to be obvious. They must cross the seas and climb over the mountains.

* * *

We turn with curiosity and anxiety to see what this careful, discriminating, and splendid authority has to say about the 'yellow peril.' He says that there are three possibilities which may be considered under that head. In the first place, there is the possibility of the swamping of the slow-multiplying, high-wage white societies with the overflow that is bound to come when China has applied Western knowledge to the saving of human life. This possibility is declared by Professor Ross to be real and imminent, and he says that nothing but a concerted policy of exclusion can avert it. Then he says that the second possibility is the overmatching of the white people by colossal armies of well-armed and well-drilled yellow men who, under the inspiring lead of some Oriental Bonaparte, will first expel the Powers from Eastern Asia, and later overrun Europe. Professor Ross has reasoned it out that this forecast is nothing better than 'dream-stuff.' The third of the possibilities of the 'yellow peril' is that there may be an industrial conquest of the West by the Orient. Professor Ross observes that, contemplating the diligence, sobriety, and cleverness of the Chinese, in connection with their immense numbers and their low standard of comfort, some foresee a manufacturing China driving us out of neutral markets, and obliging our working-men, after a long, disastrous strife with their employers, to take a Chinese wage or starve. Against such a calamity he thinks the great industrial nations will be able to protect themselves neither by immigration barriers nor by tariff walls. There, indeed, is a 'yellow peril'! I notice, by the way, that in Shanghai, where wages are supposed to be very high, the textile-workers earn fourpence-halfpenny for a day's work of eleven hours.

* * *

In such contemplation as the foregoing we are looking from the back to the front. Changing the subject, let us glance in a lighter mood from the front to the back. In an intensely rapid and materialistic age there must surely be a strong tendency towards the discouragement and abolition of red-tape methods such as flourished exceedingly in the happy days of the mid-Victorian era. What then seemed to be very regular, quite thorough, highly official and proper, and smacking of a fine conservatism of the best kind, looks in these very different times to be mere and foolish nonsense. The Government departments have been wound round and round with this red-tape; but in recent years much of it has been pulled away, and action in

simple matters made freer, easier, and more satisfactory to all concerned, even though the old officials do sigh when they find a splendid indirectness of method giving way to something that is plain and very quick. Hard things are said of the reigning Government, as of many others; but there is one thing certain, and it is that it has introduced a new thoroughness and efficiency in its departments, and has done much to abolish red-tape ways. Very likely that is not so much to the credit of the Government as to the times and the prevailing sentiment, and probably if any other Government of any political complexion whatsoever had been in power at the present time it would have done the same. Let it be so. But there is a story afloat that one time lately, when a national crisis of the most serious character was pending, and a conference between leaders was abundantly necessary, some considerations of red-tape were brought forward, and threatened a dangerous delay; whereupon a Cabinet Minister of great celebrity exclaimed that that was no time for nonsense, and, overruling all precedent, there and then set a new example of business-like directness, the good consequences of which were immediately apparent. But it will take a very long time to kill red-tape here and abroad, meaning particularly on the continent of Europe, where it flourishes exceedingly. One is reminded of the fact by the amazing thing that happened when the *Delhi* ran ashore at Cape Spartel and the lives of hundreds, including distinguished members of our Royal Family, were gravely imperilled. At this moment of terror and danger red-tape was produced and flourished to the utter aggravation of the people who were so seriously concerned. It was reported in this way: When the *Delhi* went ashore she could not gain wireless touch with the naval authorities at Gibraltar, as for the most obvious reasons she very much wished to do. In order to get a message to Gibraltar she had to communicate with Cadiz, and then Cadiz, it is said, sent the message on to Gibraltar. This slow and roundabout method of communication at a time of crisis was explained by the circumstance that the Admiralty wireless station at Gibraltar 'does not take in commercial messages.' There was the rule, and it had to be obeyed, though ships (commercial) were sinking, and men and women were drowning. But still, for all that, when they heard at Gibraltar—*viâ* Cadiz—that the King's sister was in danger on one of those 'commercial ships' with which they were to have no wireless communication, there was something in the nature of a panic, and battleships, cruisers, torpedo-boats, and tug-boats were despatched with all possible hurry to the scene of the disaster. The good French have no such rule about ignoring 'commercial ships,' and so it fell out that the French cruiser *Friant* was the first to go to the aid of the *Delhi*.

It has been deduced from what happened on this occasion that no ordinary 'commercial ship' need ever look for naval aid from Gibraltar, whatever plight she may be in, and despite any amount that her owners may be paying towards the cost of the navy. This is not because the Admiralty is, though highly official, at all inhuman, or does not sympathise with British subjects who are drowning and the owners of British vessels that are sinking. Unofficially it sympathises exceedingly; but it bears very well in mind that the navy is one thing, and the mercantile marine quite another; and there are occasions and places, as down here in the neighbourhood of the Rock, where distinctions must be observed—for the sake of red-tape and all that it means. But perhaps after the affair of the *Delhi* there may be a change. This might have been a tragedy of red-tape; but happily the consequences of the employment of such methods are for the most part merely irritating or splendidly comic. Indeed, when our modern forwardness is complete, when we run our lives at the top-speed of which the machinery of the world and of the brain and the human system are jointly capable, and red-tape, therefore, dies the death finally and for ever, a book must be written about these comedies, that our successors may know of some of the pretty little ways in which our lives were coloured, and how some fancy embroidery of officialdom was bound to the plainest, simplest transactions. In Britain, in the dying days of red-tape, we have achieved some rare records in this respect; but still I think that in this matter we are, after all, excelled by some of our Continental fellows, hard as those who have suffered through War Office and Admiralty practices may find it to believe. I developed a suspicion in this matter some two or three years ago, and then for a little while made some effort to gain particulars of current cases, resulting in some interesting facts bearing upon the subject coming my way from France and Germany.

* * *

The first case, a strange one, concerns the French Colonial Department and the Governor of Martinique, who is responsible to that department. Some little while since this worthy Governor found that he was in need of a few pins and a corkscrew in his office, and so he rang the bell for his secretary and asked him if he would kindly see that they were duly provided. Then were all the playful demons of the system of red-tape loosened. The secretary found it necessary to point out to the Governor that any such expenditure must be sanctioned by the Minister of the Colonies, and so accordingly the Governor telegraphed to Paris in these words: 'Please send at once one and a half pound of pins and two corkscrews.' When the Minister of the Colonies received this urgent message from Martinique he did what was pre-

scribed for him by rule and by custom, and sent the telegram on to the accountants' department 'for approximate estimate of the outlay to be incurred.' The chief accountant made a note that in his view the expense would be excessive, and he took occasion to remark that his wife did not use so many pins even for her most elaborate costumes. He sent the telegram and these notes to the director of the political department, who made a lengthy report on the character and record of the Governor, which on the whole was of a favourable tone, and he concluded with an expression of the opinion that the request for the pins was not unreasonable if they were purchased at a fair price. As this turns out to be a remarkable story, I would emphasise that I do not pluck from imagination nor weave a tale of myths and fairies, but only quote from a printed statement of what happened at the time. The *dossier* went from the chief of the political department to the commission of purchases, where the officials were in disagreement as to whether it would be advisable to purchase those pins by private contract or otherwise. Eventually they determined upon the former plan; and, having done that, they sent the *dossier* back to the political department, who returned it in turn to the accountants, who delivered it to the Minister of the Colonies. The Minister gave his close attention to what had occurred, and, turning the matter over in his mind, came to the conclusion that the purchase ought not to be made by private contract. Therefore he sent the *dossier* back to the accountants, who transferred it to the political department, who delivered it to the commission of purchases, who now took the view of the Minister, and agreed that private contract was not the best way of effecting such a purchase, and sent the fast-expanding *dossier* back to the supreme official by way of the circuitous route that it had previously travelled by. Thereupon the Minister sanctioned the expenditure. The *dossier* was bandied about for some time longer, and it grew greater and greater; but at last it fell again into the hands of the commission of purchases, who were given a free hand to proceed in the matter. It was then fourteen months from the time that the Governor of Martinique had sent the telegram, and this original message was now buried among two thousand four hundred and twenty-seven documents that had been prepared in reference to it, while the pins that held these papers together were nearly as numerous as those which the Governor asked for. Whether the two corkscrews ever got from Paris to Martinique I cannot say, but have a fancy that officialdom did not jib so much at them.

* * *

And then I have a yarn of the red-tape way as it is practised in the Post-Office of Germany. Not long ago a little German boy, in a spirit of mischief, amused himself by tearing up some ten-pfennig stamps, which, as you know, are the equivalent of our penny stamps. In this state of tatters they were inconvenient, and perhaps useless, and so the father of the boy, after applying suitable chastisement to his offspring, proceeded to the Post-Office, and there inquired whether he could have them exchanged. He was passed on from official to official, investigations were made, solemn deliberations were held, and at last a personage decided that only stamps to the value of at least one mark, or a hundred pfennig, could be exchanged. This ruling seemed to present a dilemma, but it was thoughtfully suggested to the applicant that in time his little son might destroy some more stamps, and that he had better wait until then, when, having a full mark's worth, he might renew his application with every prospect of success. But the keen non-official German mind leaped to an idea that was better than this. 'Why,' said the applicant, 'I should be glad if you would now give me stamps to the value of sixty pfennig.' The official did so, whereupon the man gravely tore them up into small pieces in his presence. The magnate of the Post-Office smiled as he realised the deep ingenuity of this person, and he gravely exchanged all the fragments of the ten stamps for ten new ones that were as perfect as German machinery could make them. Of such is red-tape of the European kind. They have some of it in new America after all; but there it takes highly eccentric forms, and is not a product of age as it is in the Old World here.

THE CAHUSAC MYSTERY.

CHAPTER XV.—A DREAM DIVORCED.

A FORTNIGHT had passed. Cahusac was back in London, baffled, hopeless, embittered more and more every day, half-maddened with his wounds, as the young must always be. Cahusac heard everything, every wretched variation that made capital either in the way of amusement or gain out of his story.

There are several different modes of taking a reverse of fortune, and most of them consist simply in running away; it may be done gracefully or awkwardly, but escape from the world's ungentle observation is generally felt to be the easiest thing to do in adverse circumstances. Cahusac stayed. His great, intangible foe, the octopus of rumour, assailed him hourly. It was said that he had sent in his resignation to the

Foreign Office. That was expected, as being the only course left open to him. Rumour springs from guesses; problematical opinion is the head-water of its flow.

But Cahusac had no intention of retreat. He endured the routine of his life, meeting many cold looks and changed faces. As was inevitable, a certain amount of suspicion made its way between him and some he had counted his friends in official life.

The enforced waiting had begun again, only under infinitely more trying conditions. To do nothing, to know that chance alone could ever make it possible for him to clear his father's honour, was as hard a lot as any man could be called upon to endure. He had gone again and again through the reports and sifted the evidence connected with the murder; but beyond the fact that the knife used was proved to be one stolen from an eating-house near Leicester Square, no light had ever been thrown upon the matter. Puyfot's claim to further knowledge must be taken at its probable worth — the passionate outbreak of an absinthe-drinker. Chance, and chance only, could befriend Cahusac; all his days he must be alert and awake to seize it, although he was pitifully aware chance might never come his way at all.

His dominant desire at this time was for forgetfulness, to escape somewhere away from the ever-present pain. He had the longing to eat of the lotus-flower and to forget—forget his whole past and his whole future, to be done with the battle for ever, to be able for the first time in many years to feel that things began and ended in the ample, gracious present. It was the longing for a mental holiday, such as all strugglers know, a longing the very thought of which sent him back with a rebound into the clash of real life. This dream was always at his elbow: that somewhere overseas, outside and beyond the turmoil, there was a peaceful silence and drowsiness where he might steep his tired brain in sleep.

Sometimes he would wish he had himself sinned some large, romantic sin. At least he could have had himself to blame, to curse. Remorse appeared to his mood of the moment easier than the burden he carried. Still, the exigencies of life demanded constant service. Often the social necessity to do this or that drove him to the borders of frenzy, a revulsion all the keener because he could never give voice to his wrath and wretchedness. One essential of his situation was silence. The single safe confidante he could have gained at this period he did not choose to seek. Through all these wild heart-burnings it was to Alice Lanceley that his mind turned longingly. What rest, what comfort could he not find with her had his fate been happier! He dared not enter for the race which forms a part of every other man's career. He was not only handicapped; it was more than that—he had been penalised by the misfortunes of those who went before him, and that heavily. He was as one born maimed, mutilated. Why had they not shut him out in his childhood from the light of the sun whose gladness he must never again enjoy?

Society continued to send cards to Cahusac, but they were rather less numerous than in the old days. So far he had not shown himself anywhere; he would allow the discussions and the gossipings time to blow over a little. Yet, on the other hand, although he could permit society to forget him, he must not permit it to drop him. To maintain his social and official position was a part of his plan.

Therefore, on a certain night late in May, he made up his mind to appear at a reception where he was sure to meet Alice, whose family took a prominent part in political and diplomatic affairs. Her uncle, the Earl of Fulham, a painstaking and upright person, deserved well of his country on the whole. He had not genius to place at her service, but he gave the entire energies of his manhood, and in a private capacity set his fellows an example of unaffected well-doing. Lord Fulham held the British opinion that a man should be considered innocent until he is proved guilty, and instructed his wife to be careful never to omit Cahusac when she sent out cards.

Now it need hardly be said that the one person whom Cahusac truly desired to meet in all London was Alice Lanceley. He did her the justice to believe that he would find her the same; worldliness had not smirched the fair whiteness of her nature. He owed it to her and to himself to tell her that he had gone down into the battle and met defeat.

Would life be better for him or worse, he wondered, after he had seen her and told her of his failure? He imagined their meeting in a hundred different ways; he comforted himself with illusory conversations, knowing them to be impossible; he pictured her—her attitude, her oval cheek perhaps paling a little, the droop of the red lips; but above all the look—the sad and tender and sympathetic look — she must raise to his when he told her. The noises of the city filled his ears, but below all they pulsed to the music of her name.

Some such thoughts revolving still in his mind, he stood near the head of the great staircase of Fulham House and kept a watch upon the slowly rising stream of heads that moved upward from the entrance-hall.

Backward and forward passed the thronging groups, the social rout for whose commendation many live, the circle among whom it is often small pleasure to be accepted, and much dishonour to be left out. De Sarsan arrived, and bowed to him with a marked courtesy; but Wilford, ghastly pale, chattered past with a nod.

It grew late. Alice had not come. He began

to wander through the rooms, when in a doorway a hand was timidly laid upon his arm.

It was Alice. She said nothing; merely offered her hand.

Taken at a disadvantage, for once Cahusac spoke from his heart. 'I thought you were not coming. Thank God!'

She flushed prettily, and drew him gently away from the crowd. There was very little self-consciousness about her. She acted as her feelings prompted, without much thought of consequences or of what the world would think about her. To be near those she loved, to show them kindness, were her ruling desires. 'You look so unhappy!' she said with a little glance into his face.

'I dare say you have heard?' He had not meant to say this; but for the moment he was as impulsive, as natural, as herself.

'Oh yes, and I have been so sorry! Let us go into the library. We can talk there in peace.'

His heart throbbed. He was not thinking of to-morrow, but of the present only, while her hand lay on his arm. She knew all the rumours, yet there was no change in her eyes. Pity was there, and surely something that is above and beyond pity. The sweetness of her sympathy intoxicated him. He plunged up to the neck in dangerous waters. He sat beside her on a couch, and, bending to watch her face, he said, 'So you have heard the rumours?'

She smiled. She had feared to find him different, feared to meet the old half-derisive Malcolm instead of the man with whom she had parted in Park Lane, the man whose voice echoed love, although his words only bordered upon that theme. 'What does anything like that matter? You are you just the same!'

That she should forsake in a second the conventional ideas in which she had been educated all her life almost startled him. Most men like to figure as gods in the eyes of the women who love them; at the least they would wish to bear the semblance of honest men. Thus Cahusac, when he slowly realised the full force of her words, felt almost dismayed. It was not because Alice believed in him through good report and evil report that he found her unchanged; his character apparently gave her no concern. She was the same merely because she liked him. It was the unreasoning liking of a girl, not of a woman, he told himself. Yet he was conscious of a certain shock at the discovery.

'But these reports touch my honour and my father's good name,' he said very slowly, as if wishing her to take in a new idea. 'That must always matter. You are so innocent that you cannot realise it.' He averted his face that she might not see the agony upon it.

'I am so sorry for you, Malcolm! I pity you so! It seems hard that I can do nothing to help you.'

Her voice created a turmoil in him. Her point of view was to his man's mind so inexplicable. Disgrace she treated as a trifle, but his unhappiness and her own inability to comfort him loomed large upon her. But once more he told himself that it was not the mind but the heart—the heart which was speaking through her words.

'Alice, have you heard the story? They are saying—all sorts of things,' he said.

'They?' Alice in her imagination saw them —*they*, the cruel, vague enemies of whom he spoke. Their dimness, their unknownness, added to them strange terrors in her simple mind. 'And you can do nothing? I am so sorry for you!' she repeated.

There are few things a man of Cahusac's calibre dislikes more than to feel a woman is giving him her pity. He is unconsciously in his own mind something of an idol, and he perhaps prefers a common form of adoration to the highest form of pity. He wanted to set her right with regard to himself.

But, while he waited to pick his terms, she went on in her sweet and plaintive manner, 'But it doesn't really matter what people say —that is, I do not mind.' She hesitated. She was making a weak effort to gain him and the happiness that she felt might even now elude her clinging hands. 'I know you; that is enough for me.'

The simple appeal wrung him. Her innocence, her very lack of capableness, touched him as nothing else could have done; he had never loved her so much as at that moment when she had proved her incapacity to reach the heights and depths. She could not understand; but she could love, and nature had made her defenceless.

Cahusac's face turned gray. A word, 'I love you. Let us go away together from this hated world—those hateful people—somewhere where you can be mine and be happy!' How he longed to say it, to take her in his arms and to shield her gentle lovingness from all the buffetings of life!

Perhaps she read how near her fate trembled to the balance. She made a little movement, and in her April-blue entreating eyes shone love.

He could not trust himself. He sprang to his feet and walked hurriedly up and down the room, and through his fading dream of what might have been showed the dolorous vista of his future. He must not say all that he longed to say; but yet he felt some word must pass from him to her, some landmark to be set up in the memories of both.

'Alice,' he said, 'I can never tell you how grateful I am to you. You have given me new strength. You have given me a wild-flower of romance. I can never gather it, but it will always remain my dearest remembrance.'

She rose. Her effort had been in vain. 'Why will men give up all their happiness for an idea?' she murmured. But he would not dare to listen. For her sake he must not hear.

'We may meet again, but never in the same

way. Alice, whatever you hear of me, whatever may happen, believe in me still a little.' He could not choke down this last appeal. 'I want you to remember that you have been more to me here to-night in your kindness and your sweetness than you can ever know. Do not look sad! I can never repay you; but I shall like to think that you are happy. I will wait to see your smile when we pass each other by.'

She clasped her hands together. 'Is this good-bye?'

'Yes, dear, it is the real good-bye between you and me.' He lingered a moment at her side, and was gone.

She sank back upon the couch. She was dry-eyed, hopeless, in a pathetic, submissive way. He had decided; she must submit. It was this very quality of soft submissiveness which had won upon Cahusac's strength.

'I cannot understand these things,' she said sadly to herself. 'I want to be happy; nothing else matters. But I don't know how to tell him so.'

(To be continued.)

THE NAPOLEON CULT.

By HAROLD F. B. WHEELER, F.R.Hist.S.

THE newspaper war recently waged on the question of Bonaparte's supposed visit to London, a lengthy leader on the subject in the columns of the *Daily Telegraph*, and the formation of an Order of Napoleon in the Metropolis are faint indications of the enormous growth of the Napoleon cult.

At St Helena the fallen Emperor averred that in a hundred years people would be asking for details of his meteoric career. The prophecy has been fulfilled, but in a shorter period than he anticipated. Indeed, a certain amount of sympathy, blended with curiosity, was aroused before his death in 1821 by the questions asked in the House of Lords by Lord Holland, whom Scott not inaptly calls 'Napoleon's compassionate and accomplished advocate.' With considerable skill and energy he championed the exile's cause so far as the Hudson Lowe epoch is concerned, stating that 'it would not be considered by posterity whether Bonaparte had been justly punished for his crimes, but whether Great Britain had acted in that generous manner which became a great country.' This is well said, and time has abundantly justified the noble peer's conclusions.

In 1894–95 there was a remarkable Napoleon boom in the United States, which put such popular favourites as Washington, Lincoln, and Grant entirely in the shade. Magazines and newspapers teemed with matter anent the man so long vilified by us as the Corsican Ogre. Archives and portfolios were ransacked for likely material, which, when found, was almost worth its weight in gold. Posters by Grasset and Métivet decorated the hoardings. America had 'discovered' another hero at whose feet to worship.

Britain, if slower in these matters, is more sure in lasting qualities, and new books on Napoleon are continually offered to an ever-appreciative public. It is an axiom with publishers that such works rarely have to be 'remaindered'—that is, sold at a reduced price to booksellers in order to dispose of them. Every side of Napoleon's complex career has been dealt with. He has been written up as administrator, soldier, bibliophile, dancer, lover, and lawgiver. Some biographers are vitriolic, others commendatory, a few just. You can always pay your money and have your choice.

For this strange revival of interest in the Emperor who threatened to invade these islands we have to thank Lord Rosebery to no little extent. His *Napoleon: the Last Phase*, is an *apologia* for our unhappy treatment of the central figure of his monograph. It makes a winsome appeal to the more refined instincts of those who live in an essentially humanitarian epoch. Many books dealing with the same period have been issued since the appearance of the first edition in 1900, until they now fill a lengthy shelf in the historian's bookcase. It is not surprising to find the *Saturday Review* saying that 'if the chances of Imperialism in France were to be estimated by the amount of literature which the career of Napoleon continues to evoke, they would surely be good.' There is at least one monthly magazine devoted to the Cause—namely, the *Revue Napoléonienne*, issued at Rome, and founded in 1901 by Baron Albert Lumbroso.

Reference to the founder of the First Empire is constantly made in the more serious journals and reviews, while any particular man of the moment is almost invariably referred to as the 'Napoleon of Surgery,' or whatever his profession or trade may be. Quite recently I read in an advertisement of somebody's indigestion cure that Napoleon lost the battle of Waterloo owing to over-indulgence in fried potatoes, a statement not borrowed from a text-book. The first thing I observed when boarding a Brussels tram-car the other day was a boy's tie-pin on which was emblazoned a portrait of Carlyle's 'last great man.' At Liège a fancy shop displayed a fine assortment of Napoleon busts from one franc seventy-five centimes, and almost every tobacconist in Brussels was eager for me to buy a meerschaum pipe on which was the carved presentment of the same set face. Blind hero-worship is perhaps allowable on the Continent;

but I discovered that those who purchased souvenirs of the Emperor of the French so artistically displayed in the arcades were usually Britishers!

The little man with the big brain has also invaded the realm of fiction. Who has not read Lever's *Charles O'Malley* and *Tom Burke*, Doyle's *Adventures of Brigadier Gerard*, or at least one of the many novels in which the Emperor figures? Even Mr Wells could not resist introducing the colossal figure in *Tono Bungay*. Napoleonic plays have not always made fortunes for their producers; but I remember seeing *A Royal Divorce*, and glorying in it, before I had reached my twenty-first birthday. It is still 'on tour,' and likely to remain so. Such efforts as *The Duchess of Danzig* and *L'Aiglon* require no further reference.

Quite an extensive list could be made of eminent living personages who are captivated by Napoleon. The present Lord Chancellor is never tired of reading about him, and his literary appetite is appeased by frequent visits to the library of the House of Lords, which contains a magnificent collection of works on the subject. Lord Rosebery has a fine collection of relics, the Earl of Crawford takes pride in thousands of volumes on 'Corporal Violet,' and three of our Field-Marshals—namely, Earl Roberts, Viscount Wolseley, and Sir Evelyn Wood—have contributed to our knowledge of the campaigns of the Great War. At the time of his death Sir William Butler was engaged in writing a life of the Master-Captain, the composition of which must have been facilitated by his vast hoard of Napoleonic pamphlets and books. When the Right Hon. Winston Churchill visited Uganda in 1907 several volumes on Bonaparte were included in his baggage. Edison, when asked whose voice of all the great men of the past he would rather hear on a phonograph, promptly replied, 'Napoleon's.' Madame Sarah Bernhardt's apartments at her own theatre in Paris are mainly decorated in the Empire style, and the initial 'N' is conspicuous. Perhaps the most blatant worshipper of Napoleon was President Francia of Paraguay; he got his idea of Napoleon's costume from a grotesque German caricature, which led him to wear a gray dressing-gown and a cocked hat in the streets of Asuncion.

Pictures in which the Emperor figures have been frequently hung on the walls of the Royal Academy, perhaps the most popular being Sant's 'The Last Phase.' It differs considerably from the death-cast taken at St Helena, and is rather an idealised presentment than an attempt to depict the fallen monarch as he really was. The mask resembles more the Napoleon of the Consulate, thin and emaciated, and Sant's 'portrait' surely makes the man appear considerably older than his fifty-one years.

No visitor to the Tate Gallery misses 'On Board H.M.S. *Bellerophon*, July 23, 1815, off Cape Ushant,' considered by many critics to be Orchardson's masterpiece. Crofts, dubbed by some 'the English Meissonier,' was never happier than when he had a Napoleon subject in hand. His first Waterloo picture, finished in 1876, now hangs in the Sheffield Art Gallery, together with 'Wellington's March from Quatre Bras to Waterloo.' Two years later he showed at the Paris Exhibition his 'Napoleon seated Outside a Cottage.' 'On the Evening of the Battle of Waterloo' was painted in 1879, and now finds a home in the Walker Art Gallery, Liverpool. His 'Napoleon's Last Grand Attack, Waterloo,' was exhibited in 1895, the year before Crofts became an R.A. Eleven years later he showed 'Near La Belle Alliance.' This by no means exhausts the list of similar productions of his versatile brush.

It was Meissonier's ambition to paint a series of five pictures representing Napoleon in 1796, 1807, 1810, 1814, and 1815. He lived to complete but two—namely, 1807 and 1814. The former, which shows the battlefield of Friedland, took the artist fourteen years to finish, and was eventually sold by auction for thirteen thousand four hundred pounds. What a quaint comment on a certain schoolmaster's report anent a scholar named Meissonier, age eight! 'Ernest,' it runs, 'has a decided taste for drawing. The mere sight of an engraving is often sufficient to make him neglect his most essential duties.'

Verestchagin, the Russian artist, painted a series of fifteen Napoleon pictures. When the Kaiser visited the artist's studio he stood for a long time before the famous 'Retreat from Moscow.' 'And in spite of that,' the Emperor remarked, 'there will still be men who want to govern the world; but they will all end like this.'

The greatest living battle-painter is M. Édouard Detaille, who has given the world many pictures of the stormy period of the Consulate and the Empire. One of the best, although one of the smallest, of his works is entitled 'Napoleon in Egypt, 1798,' now in the possession of Sir George White, Bart., of Cotham House, Bristol.

Napoleon has rendered almost as much good service to modern caricaturists as he did to their ancestors Cruikshank and Gillray. Although the versatile 'Caran d'Ache' is no more, his successors keep up the tradition in the French Press, so much so that the shades of the modern Charlemagne seem to haunt the majority of their humorous military sketches. On the mantelpiece of the master's studio stood a beautiful bust of Napoleon, flanked by quaint groups of soldiers of the Grand Army cut out in wood after the artist's own designs. His grandfather served the founder of the First Empire well, and was decorated on the battlefield for his services. Caran d'Ache is Russian for lead-pencil. The real name of the famous caricaturist was Emmanuel Poiré. Some of my readers may remember his wonderful shadow-pantomime called *L'Épopée*, in which no

fewer than four thousand silhouette figures appeared in thirty tableaux of the Napoleonic drama.

The return of the Empire gowns may not be traceable to any enthusiasm on the part of the fair sex for Britain's greatest and most persistent antagonist; but Napoleon door-knockers, pipe-stoppers, and bottle-corks fill a useful purpose in man's existence.

The Order of Napoleon, a novel and exclusive society, held its first annual dinner in London on Waterloo Day 1910. A newspaper commented that 'it is seldom a foreigner has such a little band of worshippers in a land which at one time was strongly, and rightly, hostile to him. Time works many changes.' One of the rules of the Order is that each member shall wear a medal on which is stamped Napoleon's head and the French Eagle.

Why does this arch-type of super-man interest us? The answer is partly contained in the question. He who has achieved will always attract, and for an unknown lad to leave an obscure island, ascend the throne of a great country, and become practically Emperor of the West is so romantic that it must necessarily appeal to the imagination. No man ever accomplished so much in modern times; hence the interest which the magic name of Napoleon is likely to arouse for many generations to come. The most passive citizen is usually willing to admit that armed force is sometimes a necessity; he admires in a diffident fashion the man who is capable of wielding 'the big stick.' In the British army the strategy of Wellington's antagonist is studied with greater application than that of the Iron Duke, if only because circumstances enabled him to accomplish more.

But enough has been said to show that Napoleon has cast a spell on us, and I put down my pen to scan a French magazine which has just arrived. The first advertisement I glance at reminds me of the illustrious name, for it shows the Emperor in characteristic attitude guarding Somebody's Fountain Pen. And now for a pipe of '1812' Mixture.

M A'M S E L L E.

CHAPTER IV.

THE year 1813 passed; it was the beginning of April 1814; Captain Heacham had taken tea with Miss Wimple; and he and Claudine were wandering arm in arm in the pleasant garden of Parthenon House in the soft twilight, planning, discussing, and talking, as they often did, of what they would do when the much anticipated peace would be a fact. Gaston de Bussy was still in the prison. Not once since his arrival had he spoken to his sister, but her lover gave her daily news of him, and reported that his influence for good among his fellow-prisoners was very much what hers had been. He had given no sign of wishing to escape, although almost weekly reports came that most advantageous offers of exchange for him were made from France, and it was universally believed that the presence of his beloved sister so near at hand would keep him at Staple Cross.

Charlie Heacham was pointing out to Claudine sundry indications of a coming change of weather in the hitherto cloudless sky, when, at a spot in the garden where the bushes were highest and thickest, there sprang up, apparently from the very ground, a heavily cloaked figure—whether male or female it was hard to distinguish in the gathering darkness—with a suddenness which made Claudine utter a little cry of alarm, and caused even the young officer to step back a pace or two.

A paper was thrust into Charlie Heacham's hand, and the figure disappeared as suddenly and swiftly as it had come. As it was impossible to read the paper where they stood, Charlie and Claudine hurried back to the house. There they read a scrawl—evidently a purposely effected scrawl: 'West side of prison. Eleven this night. Under the trees opposite burial-ground. Armed, and take men with you. Do not fail.'

The young officer shook his head dubiously. 'An old game; get me there, and'——

'Go, Charlie—go!' entreated Claudine.

For a second the young man looked at her, as if some sort of doubt was within him. 'Why, Claudine, surely'—— he began.

'No, no!' she whispered. 'You know I would counsel you for the best. Remember, I am a true woman; but still, I am a woman. Go!'

The sweet April day had given way to a wild, tempestuous night. Shortly before eleven Charlie Heacham, with a couple of officers and half-a-dozen armed men, passed quietly out of the prison and went to the line of trees which bounded the northern side of the great west road, some fifty yards away from the southern wall of the prison. Opposite them, on the other side of the road, and divided from it by the usual hedge and ditch, were the gardens owned by Bungay (whence was obtained the vegetable-supply of the prison), open, treeless and flat, the line being broken only by a large potting-shed. A hedge bounded the gardens westward, and beyond the hedge sloped the long field, part of which was the prisoners' burial-ground.

The rain drove in sheets before a chilly south-west wind, and the little party, clad though they

were in greatcoats, were glad to keep behind the tree-trunks. The down London mail thundered past, then a solitary post-chaise going eastward; then the storm and the night had it all to themselves.

The minutes seemed hours. The great bell of the prison boomed eleven, and during a moment's lull of the storm the 'All's well!' of the nearest prison sentry was faintly heard. Every pair of eyes was fixed upon the faint blur which denoted the opposite hedge-line.

'Watch the shed!' said a voice in Heacham's ear. He started, for even his sea-trained and seasoned nerves were at high tension. He *felt* something pass quickly away, although he could neither see nor hear it.

Presently a light—or rather a thin streak of light—appeared on the blur which was the hedge.

'Across!—quickly!' said the voice again.

This time Charlie Heacham was not so startled. He darted out his hand. It caught a cloak—nothing more. Throwing the cloak over his arm, he passed the word along the trees for all to advance. With the quiet and swiftness of trained men the little party moved across the road, passed through a wicket-gate into the field, and advanced towards the now-darkened shed. Posting his men around the shed, which had a locked door, but was windowless, Charlie awaited events. Presently a thin streak of light appeared in the side of the shed near him. It came through a crack which was sufficiently large to enable him to see what was within.

Almost panting with excitement, he looked, and could hardly repress a cry of amazement when he saw standing, or rather stooping, his back to the door, and in his hand a lantern which was held steadily in front of a dark opening in the back—that is, the north side—of the shed, the floor of which was a couple of feet below the field-level, John Bungay! The storm raged wildly, so that Charlie could pass word of what he saw within. The officers drew their pistols; the men cocked their muskets; all waited in the most intense, suppressed excitement.

In a few minutes Bungay stooped lower, as if listening, and then waved his lantern gently and slowly. Then he raised himself, placed the lantern on the ground, pulled out his watch, looked at it, and paced up and down the small space in evident disquiet and impatience.

Suddenly he stopped short in a listening attitude, ran to the lantern, and again waved it in front of the opening. In another minute a dishevelled, mud-bedraggled figure, crawling on all-fours, appeared at the hole entrance.

It was Gaston de Bussy!

He would have sunk down with exhaustion had not Bungay lifted him bodily on to a rough seat, and made him take a pull from his spirit-flask. For a moment Heacham's heart was moved with pity for the sad spectacle presented by this erstwhile spruce and splendid young sailor, the brother of the girl he loved. But the tremendous significance of the discovery made, the solution of a mystery which had for so long baffled the keenest and cleverest of His Majesty's officers, and the exposure of the very last man of his acquaintance whom he would have suspected of such actions outweighed all merely sentimental considerations.

Bungay spoke eagerly and rapidly to the young Frenchman, at the same time that he held his watch in his hand, from which Heacham gathered—for of course he could not hear a word—that time for the conclusion of the enterprise was pressing.

De Bussy, revived by the liquor, then stripped himself, and in a few minutes was transformed by Bungay into a respectable-looking countryman, with clothes from what in the imperfect light seemed to be an extensive wardrobe. Then came the consultation of a map, a few words from Bungay, evidently of counsel, the counting out by that gentleman of money into the Frenchman's hand, and all was ready for the last scene.

At a sign from Heacham an officer and a man placed themselves on each side of the door.

John Bungay placed the lantern on the ground, opened the door, and peered out. 'Come on!' he said. 'All's clear. Remember, the London mail calls at the "Bell" half-an-hour after midnight. Be there just as it comes in—not before.'

The two men stepped out, were instantly seized, and before they could struggle, much less use any weapon of defence, were gagged and bound.

'And you of all men, John Bungay!' was all that his captor said.

'And now we'll have this rascal's secret,' said Charlie Heacham to the lieutenant after he had seen the prisoners start off for the prison with the other officer and the men.

Carefully locking the shed-door, he examined the passage by which Gaston de Bussy had come. It was well and neatly cut through the clay, and of just sufficient dimensions to enable a big man to crawl without much difficulty.

'If it is cut straight,' he said, 'it should come out at or near the hospital. Shall I lead?'

His junior assented, and having divested themselves of all clothing but boots and trousers, the two officers started, Heacham leading with the lantern. Half-an-hour's laborious progress, during which they rested themselves several times by lying flat down, brought them to the end of the tunnel proper, and into what seemed like a circular stone-built chamber in which, to their immense relief, they could stand upright. Holding the lantern above his head, Heacham saw that they were at the bottom of a well, of which the mouth seemed to be blocked. At intervals in the side stones projected, forming

evidently the means of descent, and therefore of ascent, and up this with infinite pains, and not without danger, the captain went, the lieutenant lighting him from below. Suddenly he banged his head against the cover of the well. It was of stone, and his first efforts to move it were in vain. 'I'm coming down,' he said. 'You come up, Corker, and try.'

He descended, and the lieutenant, a big man, famous for his athletic powers, went up. For some minutes Heacham heard him heaving and struggling, and then came the welcome, 'All right; it's giving. There's something on top of it. Come up with the light.'

Charlie Heacham obeyed. The lieutenant, with a mighty effort, moved the stone, and a stream of cold, evil-smelling air swept downwards.

'Good heavens, sir,' exclaimed the lieutenant, 'we're in the mortuary! And that was a full coffin on the stone!'

It was even so, and these two young men, each of whom had faced death in the open, shuddered with excusable horror as the faint rays of the lantern revealed to them a long, low chamber, on the floor of which stood half-a-dozen open coffins, from each of which peered a pale, ghastly face.

The two officers, as they had left the greater part of their apparel in John Bungay's pottingshed, had to return thither; so, carefully replacing the stone over the disused well-mouth, they proceeded back as they had come. Hastily dressing themselves, they locked up the shed, and went directly to Bungay's house in Milton. All was dark, and as no amount of knocking and ringing could procure them entrance, it was clear that John Bungay, for his own purposes, preferred that at nights he should have the house to himself.

It was past midnight when Charlie Heacham and his companion reached the prison-gate. Late as it was, and wild as was the weather, Claudine was there to meet him.

'What has happened? Tell me quickly!' she whispered.

So her lover told her. When he had finished, she took his hand and said, 'You believe that I knew nothing of this?'

'Of course I do,' he answered. 'All the same, there is a woman in it. Whose cloak is this?'

Claudine examined the garment under the entrance-lamp and said, 'Miss Mordant's. I see it all now. But, Charlie, what will become of Gaston—*imbécile* that he is?'

'I am obliged to place him in the *cachot*,' replied her lover. 'I fear he must take the usual consequences. I must do my duty, Claudine, even at the cost of your affection.'

'I know you must, dearest, and I would be the last to blame you. Poor Gaston! And yet *imbécile* Gaston!' said the girl.

'And now run back home,' said Charlie. 'Miss Wimple will be out of her mind about your being out in such weather at such an hour.'

'She knows why I am out,' said Claudine. 'I told her what I suspected; and it was because I suspected exactly what has happened that I said "Go!" when Miss Mordant handed you the paper in the garden.'

To cut a long story short, an examination of John Bungay's 'office' revealed the whole system of his rascality. It was clear that his gardening, his contractorship with the prison, and his proverbial John Bullishness were all part of his stock in trade; that he had been directly concerned with no less than a dozen escapes of valuable prisoners, and for each escape had received a large sum of money; and that a most exact system existed by which he kept in close touch with agents at the chief seaports on both sides of the Channel, and was furnished with lists of prisoners allotted to Staple Cross. How he had discovered the disused well in the dead-house was a mystery; but as in his capacity of contractor he had frequent occasion to go to the hospital close by, and was very friendly with the medical officers, it was possible that from them he might have learned about the water-supply and the well-system.

For some days Miss Mordant was not visible. Charlie Heacham called at Parthenon House, ostensibly to return her cloak, in reality to get her story, and to thank her for the great part she had played in the recent events; but she was suffering from cold, caught no doubt for lack of her cloak, and could see no one.

Milton village lived for and by the coaches. To-day Milton is a poor shadow, for no other reason than that there are no coaches; but at the date of our story Milton prospered exceedingly, for the coaching era was at its zenith, and Milton, as an important coaching change-place, was a central point of connection between the great world of London and the country around. And so, when, about a fortnight after the capture of John Bungay, the early down-mail arrived at the 'Bell,' bedecked with flags and hung with evergreens, the countryside became aware that there was great news.

It was great news—news that traversed the mile between the 'Bell' and the war-prison faster even than the coach itself could have taken it—news that set bells ringing and guns firing, and, above all, made the strong walls of the war-prison blocks rock with the tumultuous cheering, the frenzied shouting, and laughing, and crying, and singing which followed its announcement, for it was the news of the abdication of Bonaparte, and—Peace!

By the beginning of June 1814 not one man of the six thousand who but a few weeks previously had been crowded within the walls of Staple Cross war-prison remained there. One

late occupant, however, still lingered at Paxley, and this was Gaston de Bussy, whose double motive in so doing was to give evidence at the approaching trial of John Bungay for what (once merely a misdemeanour) was now accounted felony, and to accompany his sister and Charlie Heacham to Paris.

John Bungay was in due course brought from Cabotsbury jail for trial. Strange to say, it was with the greatest difficulty that the principal witness against him, Miss Mordant, was got to appear. 'I loved the man,' she said, 'and now that I have had my revenge on him I want to have nothing more to do in the matter.' However, she had to testify, and told how it was by the merest accident that on the afternoon of the entertainment at Parthenon House, at which all the local world was present, she happened to be sitting at a favourite spot under the trees opposite to John Bungay's potting-shed, and saw Captain Andrieux helped away. About her subsequent proceedings, which led to her being able to give warning of Gaston de Bussy's attempt, she remained obstinately silent; but it was generally understood that a chivalrous determination to shield Mrs Smee, the postmistress, prompted her to act thus. Gaston described his dealings with Bungay, which had opened with a communication concealed in a potato sold to him as head of his mess at one of the markets held at the prison gate, and been continued by similar methods, and the Dandy Squire received the sentence of a long term of imprisonment.

. . . . . .

Two years later a happy little party alighted at Parthenon House. It consisted of Captain and Mrs Heacham, Gaston de Bussy and a bride he had won from Normandy, and Miss Wimple. They presently came out with the addition of Miss Mordant, now 'Lady Principal of Parthenon House School for the Daughters of Gentlefolk,' and they drove along the road tramped by the captain of the *Soleil* three years before as a miserable captive to the site of the great war-prison—a vast open space already thickly grown with grass, and retaining above ground not a vestige of the buildings which had for so many years been the living tomb of thousands of brave men. Here they wandered about in the stillness and sunshine, picking out old familiar spots, visiting even the site of that dread chamber of the dead which even now the two men could not recall without a shudder, and issuing forth on to the great western road to tell again the story of that fateful April night, and to note that a brand-new inn had sprung up on the site of John Bungay's potting-shed.

Then they drove back to enjoy Miss Mordant's hospitality.

THE END.

THE MONTH: SCIENCE AND ARTS.

ARTIFICIAL WOOD.

FOR many years past inventors have displayed commendable endeavour in the perfection of a process for manufacturing artificial wood, using therefor certain materials for which otherwise there is a very limited market. Among these investigators is a Frenchman, Monsieur L. Carré, associated with the champagne industry. He attacked the problem several years ago, and for the last five years has devoted his energies to the perfection of a machine which he has evolved for making this product upon a large scale, and at such a price that for many commercial purposes it is cheaper than the material it is intended to supersede. The process is simple and ingenious, and the raw material employed is straw. The wisps are first split longitudinally into three sections to destroy the natural resiliency of the stalk, a special ripping-machine having been designed for this preliminary operation. The straw is then associated with certain chemical substances, and submitted to a cooking process simultaneously with the application of intense pressure. The result is that the straw becomes compressed into a homogeneous mass similar in appearance to whitewood cut the way of the grain. The product can be manufactured in any desired form, from thin sheets to wide planks and thick balks, and is produced in a continuous length to be cut in sections of the required dimensions. Examination reveals no evidence of the straw, as this substance has been driven into a solid mass, the fibres, as it were, being held together by the chemical ingredients. The success of the operation depends essentially upon the selection of the binding medium, and upon the cooking of the raw material, which must be carried out at a precise temperature and for a prescribed length of time; while the pressure must be sufficient to bring about perfect homogeneity, a pressure of about three tons per square inch being sufficient for the purpose. The inventor has produced sections of boarding and blocks by this process which can be manipulated by the usual wood-cutting tools, the saw leaving a clean cut. The material is somewhat denser than the whitewood which it resembles very closely in appearance, and accordingly in working slightly more effort is required. So far as balks, joists, and so forth are concerned, increased strength can be secured by building up the straw in transverse layers each about a quarter of an inch in thickness. Inasmuch as in many parts of the world straw

is a waste product, the cost of manufacture in such places comes out at a very low figure. The process should find a useful application in producing firewood from straw in those countries where timber and other fuels are costly, and the product is well adapted for heating purposes. It burns with a long flame, emits little smoke, and gives intense heat. The inventor has turned the process to novel account—the manufacture of matches. He has evolved an ingenious machine for this work, whereby the matches are turned out in batches of the desired length and thickness ready for being dipped. Such matches can be produced for less than the wooden articles made in Sweden, and should meet with popularity in those countries where wood suited for the purpose is expensive. He has also succeeded in discovering an efficient substitute for wax vestas, dispensing with the cotton fibre foundation. Another application of the process is the production of corrugated material, similar to ribbed strawboard, for packing purposes, the product being stronger and more resilient than ordinary strawboard, and particularly useful for packing bottles. The wood prepared in this manner is suited for packing-cases and similar articles, and will be found a very efficient and cheap substitute for a commodity that is rapidly rising in price.

THE VIBRAGRAPH.

An ingenious and simple machine for securing photographic records of the vibration produced by machinery, vessels, railways, and vehicles of all descriptions has recently appeared upon the market. By means of this apparatus not only is an incontrovertible indelible record of the vibration obtained, but a method is provided of actually measuring the extent of the disturbance. By its help vibration is recorded and measured in definite units with a high degree of accuracy, and the records of the movements are magnified at least one hundredfold. The apparatus is small and compact, and contains a cup holding mercury, and having a floating mirror pivoted so as to avoid lateral movement. The effect of vibration is to produce on the surface of the mercury ripples which bring about the angular movement of the mirror. The instrument is equipped with a small electric glow-lamp, and the beam of light therefrom, passing through a tube and reflected by the mirror, gives a record upon photographic paper of the movements of the mirror. The character of the photographic image differs according to the nature of the vibration, and ranges from a solid splash of light to a complex figure of lines waving in all directions. If desired, the photographic image can be dispensed with, and the vibrations followed by the eye looking through the tube. The apparatus has proved extremely useful in connection with litigation concerning nuisances arising from alleged vibration, and the results obtained therewith are certainly startling and convincing. The instrument can be made so sensitive that it will record the vibrations set up by a person writing upon a table. It certainly constitutes a distinct acquisition to any machine-room, and supplies the engineer with a powerful weapon to combat complaints against vibration.

IS OTTER-HUNTING A PITILESS PASTIME?

Against those who take delight in the systematic hunting of the otter, it must be admitted that they ignore the principle recognised by most sports—to leave their quarry at peace during the breeding season. Despite the fact that many otters are still breeding in the months of April, May, June, and July, the pursuit of this handsome and intelligent victim of the chase takes the place of the hunting of hares and foxes, which ceases earlier in the year. Otter-hunting extends over a period of five months, beginning in May and continuing in full swing until October, when, owing to the floods and the coldness of the water, it is necessarily suspended for about seven months in the year. With regard to the food of the otter, nine out of ten disciples of the gentle art will vehemently denounce him, and tell you that he is a mischievous, fish-poaching 'varmint,' without any redeeming traits whatever, to be hunted, poisoned, trapped, and shot at sight, which is, to say the least, an extremely unkind way of regarding the unhappy animal. That the otter feeds largely on fish must, of course, be admitted; but there seems to be reason for holding that he is not the utterly destructive animal he is commonly supposed to be. Reliable authorities can even be quoted who affirm that he is by no means so harmful even in trout and salmon streams as has been assumed. To some people all field-sports that involve the death of the prey seem cruel, at least if the prey is not edible. And many of those who have no objection to fox-hunting regard otter-hunting as distinctly cruel, since by the practice of the otter-hunt the poor beast has hardly a fair chance for its life, hardly even a sporting chance. An eye-witness contributes this graphic narrative to the *Manchester Guardian*: 'It is a pitiless hunt. Hounds are put on the stream, and they work up both banks. Soon they give tongue. In the language of the hunt, they have found a hot scent. They follow it to a hole in the bank. Here the otter lies high and dry, and the scratching and baying of the hounds move him not. A terrier—the gamest creature in the world for its size—is put in, and comes out badly marked. So spades are brought, and an hour is spent in digging. Then more terriers are put in, and finally the otter bolts. The chase now begins in earnest. He dives, but the bubbles mark his course. He makes to the opposite bank and disappears. Another bolt! This time he comes out the moment the terrier enters, and the couple, oddly mixed, splash into the water together. To save his life the terrier has to let go, and the

hunt begins again. This may go on for hours. One hunt I witnessed lasted four hours. The otter was chased from bank to bank, from hole to hole. He came to the side several times and lifted up his head for breath. His eyes were wild and bloodshot, his mouth quivered, and one could see that his sides heaved with heavy breathing. But there was no respite. Hounds were on him again, and he dived once more. The "field" were in the water as well as the hounds, and twice men took hold of him by the tail and tried to throw him on the bank, where, out of his own element, the hounds would have him more under command; but each time the throw failed and the otter rolled back into the water. He was dead-beat. He came up for breath oftener. He swam slowly, and the air-bubbles were larger. Then one of the hounds was lucky enough to get a grip. Instantly all the other hounds were on him too, and it was only at personal risk that somebody got hold of the otter by the tail and threw him on the bank, where he was worried to death in a second or two.' To worry a cat or other domestic animal with hounds, if only for ten minutes, is a criminal offence for which a sentence of imprisonment may be inflicted; but to worry a highly sensitive creature like the otter for eight hours or more is only considered 'good sport' and something to brag about. The longest recorded hunt with one otter took place with the Carlisle otter-hounds in October 1907. This poor tormented creature was hunted for eleven hours, and given up at 7 P.M. in the dark. A feature of this sport is that its followers include all sorts and conditions of people, who, like the huntsmen, are worked up to the wildest pitch of excitement, and join in the final worry and the performance of the obsequies, when the spoils of the chase (pelt and pads of the victim) are distributed.

THE WAVE-SUBDUING PROPERTIES OF OIL.

Although the fact is well known that stormy seas may be rendered less dangerous to a vessel by the discharge of oil upon the troubled surface, the practice does not appear to have come into very extensive vogue in shipping circles. At the same time, however, there is on the market an ingenious and highly efficient automatic device for achieving this end, invented by Captain C. C. Couves, which has demonstrated its capabilities in no uncertain manner on several occasions. The 'wave-subduer' comprises a small cast-iron reservoir containing the oil, placed above a vertical cylinder. There is a heavy piston working in this cylinder, attached to a tubular rod, which, acting partly by the aid of a spring and partly by its own weight, serves to eject a thin stream of oil on the water. The apparatus is placed as near the bows of the vessel as possible, and the discharge-jets are carried through the plating on both sides. Each jet is fitted with a tap near the tank, so that the oil can be sprayed from either side according to the conditions, or from both sides simultaneously. The apparatus is of a capacity to carry sufficient oil for a four hours' continuous discharge from both nozzles, and as it is automatic in its action, no attention is required beyond the periodical replenishment of the oil-tank. The effect of the oil is to spread a thin skin over the surface of the wave, suppressing the broken crest and making it smooth. The result is that the crestless wave rolls under the vessel instead of breaking upon her. The apparatus is cheap to install, while the cost of operation is confined to the consumption of oil. Certainly many vessels, if fitted with this apparatus, would suffer less deck-damage during gales than they do at present, or even none at all. Moreover, the need to 'heave-to' is eliminated, as experience has proved conclusively. Captains of vessels fitted with this apparatus speak highly of its efficiency. It may be mentioned that Sir Thomas Lipton's yacht *Erin* carries one of these wave-subduers, and the captain is warm in his praises of its value. Other vessels, from tramps to pilot-boats, fitted therewith have equally demonstrated its efficiency in rough weather.

ELECTROPLATING GLASS, WOOD, CHINA, AND SIMILAR ARTICLES.

An ingenious invention which is illimitable in its applications has been perfected by two Italian chemists, Messrs P. and Q. Marino. Briefly described, it comprises a means of depositing metals of any character upon any insoluble surface by electric agency. For over twenty years they have pursued this difficult and apparently hopeless task, but at last they have brought the process within the bounds of commercial practicability, and it may be stated that the results so far achieved promise to revolutionise the whole art of electroplating and decoration, as well as many other branches of industry. China, wood, glass, celluloid, paper, and other substances which hitherto have been regarded as beyond the electroplater's craft are coated as easily as the metals generally associated with this process. What is more, the plating is everlasting. It enters into the fabric treated, so that it becomes an integral part of the article. Thus, for instance, if an attempt is made to chip the plating from a glass vase, the glass will come away with its metallic coating. There is a Wedgwood tea-service on exhibition which shines with the true lustre of polished silver. The outer surface is so well covered with this metallic armour that the whole resembles a silver set. It is only when the interior is examined, and the pottery beneath is observed, that one realises that the silver has been deposited upon the external surface. What is more, the outer sheathing is not a thin film, no thicker than gold-leaf, but a solid sheet of metal which can be made of any thickness, and capable of

being worked by the engraver. Indeed, the authorities have expressed their willingness to apply the hall-mark to articles so mounted. The process is likely to supersede the present process of silver-mounting cut glass and other articles. Instead of the metallic adornment being attached by means of plaster of Paris, which is simply a makeshift, the metal deposited upon the glass becomes part and parcel of the article. At the same time, the process has extended the electro-plater's art to an incalculable degree. Any metal and its alloys can be electrically deposited upon some other metal as a base. Zinc, tin, and lead can be deposited as easily as silver or nickel. This fact is of vital interest to a host of industries, as is borne out by the action of one of the largest builders of naval vessels, who has adopted the process for the zinc and tin plating or galvanising of the steel parts of boats. The deposit is not so thin, as in ordinary galvanising, that a pin-scratch will penetrate the protective skin, but is a solid sheathing of metal, associated with the other metal beneath. The possibility of being able to plate wooden articles seems so remote as to be fantastic. Yet it is as efficiently accomplished by the Marino process as if copper were being plated. So far as china plating is concerned, the article must be in the unglazed or biscuit condition, and is first coated with a chemical agent. In the same manner, glass which is to be treated must be roughened first by sand-blasting to remove the polish and to enable the metal to secure a grip. Another point is that the deposit, no matter what the character of the base is, may be subsequently oxidised, lacquered, or what not, in just the same way as ordinary electro-ware. To the housewife the process is of far-reaching value. It will strengthen the articles in common use, and make them more hygienic, as they can be scoured and cleaned to greater advantage. She will be able to use aluminium more extensively than heretofore. By the Marino process the interior of an aluminium saucepan or coffee-pot can be given a coating of tin, which permits the use of soda and acid cleansing mediums with impunity, whereas such methods upon the pure aluminium bring about its early destruction. The possibility of being able to deposit a protective coating upon aluminium, and thus save it from oxidation, will popularise the use of this metal in many industries where, although it is urgently required by reason of its lightness, it is viewed with disfavour owing to its rapid corroding.

AUTOMATIC TELEPHONES.

Although Great Britain has lagged behind the United States and Canada in the adoption of automatic telephones, by means of which one is spared the trouble of ringing up the exchange in order to obtain a desired number, the General Post-Office is putting in at least one exchange of this character at Epsom, in Surrey. The system has been described at length in these pages (1908, page 60), so there is no need to describe once more in detail 'how it works.' The conversion of the present system into the automatic system, however, would be somewhat costly, as, in addition to the scrapping of the existing plant at the exchanges, every subscriber's instrument would have to be changed. Under the automatic system, instead of calling up the exchange-girl, as at present, the subscriber simply depresses a series of push-buttons mounted on a circular disc, numbered from 0 to 9 consecutively. Thus, for instance, to call up 19,628, he takes the receiver off its rest and then presses in succession the buttons corresponding to the figures. The effect is to set selective mechanism in action at the exchange, which brings the line of the number desired into communication with the person ringing. If the line is engaged a buzzer announces the fact at the calling-end, while if it is disengaged a buzzer sets the bells ringing at the receiver's end. The operation is instantaneous, and one can get into telephonic communication with the least delay. The system has proved strikingly successful in America, where several large and busy exchanges are working upon this principle. Its application to such an exchange as the Post-Office in London, which is the largest in the world, would dispense with the services of a large number of 'hello-girls;' but the time it would save in the course of the year would represent a colossal sum. The exchange installation requires very little attention, one man sufficing for night duty in many of the American exchanges, while the liability to breakdown has been found to be so slight as to be a negligible quantity.

AEROMETAL.

A new method for purifying and alloying metals has been perfected by Mr W. S. Simpson, the outcome of which has been the production of an alloy of extreme lightness, great tensile strength, ductility, and non-corrosive qualities. The characteristic feature of this invention is the evolution of a manufacturing apparatus working upon the vacuum system, whereby the aerometal is produced, and by means of which the several metals entering into the composition of the alloy in varying proportions are purified and so combined as to yield a product of uniform quality. It is considered that the new alloy will become a great rival to aluminium, inasmuch as it possesses the maximum of strength with the minimum of weight, while at the same time the numerous defective qualities of aluminium, which restrict its application, are eliminated. It can be used for tinplate in all cases where carbonic acid attacks bottled liquids, or where fruit, or acids or other chemicals used for preservative or other purposes, are brought into contact with metal, as in canned comestibles. As the metal is not affected by sea-water, it

possesses many possibilities in regard to marine work where lightness and strength are demanded. It should prove an excellent constructive material for aeroplanes and airships. So far as the decorative side is concerned, it should be useful in this field owing to its silvery brilliance and untarnishable character.

WALKING AS AN EXERCISE.

In these days of artificial locomotion many people overlook and miss the excellent results of walking as a health-giving exercise. Mr W. J. Cromie, the instructor in gymnastics in the University of Pennsylvania, has been telling an American audience, through the New York *Outlook*, of his own experiences in walking, how best to walk, and the benefits derivable from that exercise. He will not have it that walking is *one* of the best forms of exercise, but goes further, and claims it as *the best* exercise, all things considered, in which all the muscles of the body are brought into greater or less action. By walking for a day we can reach the highest total of labour of which the body is capable, and this without strain and with good results. Some of these results are that the lean man gains in weight and has a brighter eye and clearer countenance; while the stout man, whose system is overcharged with fat, loses weight, and is reduced to a more normal condition. Mr Cromie agrees with Weston, the veteran walker—who in his last trip, at the age of seventy-two, averaged forty-five miles daily—that walking properly will not only develop and maintain the health of young men, but will in addition rejuvenate middle-aged men, and give old men a new lease of life. Mr Cromie informs the tramper of the rules to follow, and the gradual initiation necessary before the body is in trim for big efforts. His method is to walk with the foot almost flat, so that the weight of the body at each step is distributed over the entire sole of the advanced foot. The heel should touch the ground first, not the ball of the foot, the feet should point nearly straight forward, the arms swing naturally, and the chest be expanded. The shoes should fit properly and be ample across the toes, and the stockings fit snugly to the feet, with no wrinkles. Mr Cromie finds a long walk an excellent tonic wherewith to begin work in winter, and a good way to get into shape again after a long winter; for a walk is to the system what house-cleaning is to the dwellings we live in.

A POWERFUL ELECTRO-MAGNET FOR OCULISTS.

Employés in steelworks often meet with sad accidents from a splinter of steel flying into the eye, and becoming so firmly embedded as to defy removal without recourse to a surgical operation. The organ of sight being so extremely delicate, this task is one of supreme difficulty, more especially as the sight of the eye is often lost in the process. Dr Haab, director of the eye clinic at Zurich, has recently perfected a powerful electro-magnet for this peculiar work. The idea of utilising the magnet for such an operation is by no means new; but it has not met with popular favour among oculists, owing to errors in technical design or to the liability of failure at the critical moment through the magnet not being sufficiently powerful to complete its work, in which event dangerous complications set in. Dr Haab's instrument, however, is of peculiar and simple design. The magnet is mounted upon a pedestal having a rest upon which the patient can lean in a sitting position, while the base of the pillar carries a foot pedal whereby the electric circuit can be made and broken as desired. The advantage of this arrangement is that both hands of the surgeon are left free to move the head of the patient in any way that may be required. The magnet is swivelled upon the top of the pillar, so that it may be turned to the right or left upon its fixed axis to command every part of the eye. The magnet is fitted with one of four different-shaped points, varying from a flat cone to a long, sharp needle, according to the situation of the splinter in the eye and the nature of the operation needed. Any one of these points can be fitted or removed as desired by a screwing movement. The magnet is exceptionally powerful, and its utility is not confined to oculists, but it may be employed by surgeons for the removal of metal splinters from wounds in any part of the body.

To Correspondents who wish fuller information regarding new inventions mentioned here, addresses will be furnished, when possible, provided a stamped and addressed envelope or post-card be sent to the Editor, 339 High Street, Edinburgh.

SHIPWRECK.

We talked of shipwreck in the gathering gloom,
Awed by the gale and cold insistent rain;
Pitying the travellers on the lonely main,
Then drew together in our sheltered room.
Outside, the last rose hung, a fragile bloom,
The ivy battered on the window-pane,
Till some wild impulse made us kiss again,
Striving to silence those grim thoughts of doom.

But, if so chanced, love's gallant ship at last
Broke on the rocks, lost in the ravening sea,
With torn, drenched sails, and helpless, shattered mast,
How should we meet the storm of destiny?
With wide, brave eyes, no fear could overcast?
Ah, my belov'd! lean close and answer me.

C. FARMAR.

*** TO CONTRIBUTORS.

1*st*. All communications should be addressed 'To the Editor, 339 High Street, Edinburgh.'

2*nd*. For its return in case of ineligibility, postage-stamps should accompany every manuscript.

3*rd*. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, *should have the writer's Name and Address written upon them* IN FULL.

4*th*. Poetical contributions should invariably be accompanied by a stamped and directed envelope.

THE WRATH OF ISHMAEL GOUDIE.

By MARY STUART BOYD, Author of *Clipped Wings*, *The Story of Anster*, *The Fortunate Isles*, &c.

CHAPTER I.—A DIFFICULT SELECTION.

AS she stood in the small boys' classroom of the city poorhouse, the centre of scores of inquisitorial eyes, Mrs Goudie endured a tumult of confusion. Her face, which had been blanched with apprehension when she entered the gates of the institution, was painfully flushed now, as she looked helplessly over the rows of pauper children who confronted her. In turn, they—the waifs and strays of the community—regarded her either with an indifference born of mental torpor or with the avid curiosity of those in whose turgid lives the sight of a strange face makes a welcome break.

Though the children were all under eight years old, the consciousness of being the focus of their concentrated interest fired Mrs Goudie's cheeks as she paused in an agony of indecision. The long-sustained opposition of her farmer-husband to her project at last overcome, she had left her home in Fife early that morning, glowing with the spirit of charitable adventure. For her mission to the poorhouse had been the laudable one of choosing an orphan boy whom she might rear in place of the child that fifteen years of married life had failed to bring her. But while in theory the selection of a child for adoption had seemed a simple matter, in practice it was threatening to prove the hardest task of her industrious life. Now that the preliminary negotiations had been gone through, and the conclusion of the matter rested solely with herself, the good soul found it impossible to make up her mind.

Half-amused, half-contemptuous, the teacher glanced at the comely countrywoman who stood fidgeting uneasily in her Sunday clothes. The teacher's sympathy was tinctured with scorn. 'Why should a person who was evidently in comfortable circumstances saddle herself with the care of one of these brats?' she wondered, the stultifying theory of heredity aswim in her brain. Why not adopt a boy whose parents she knew something of? The schoolmistress did not realise that Mrs Goudie's generous heart craved a child who had known no other mother, one who would come to regard her as the protecting influence of his life.

Meanwhile the pupils, little guessing that the fate of one of their number hung in the balance, stared frankly at the lady in the rose-tinted bonnet and plush dolman, whose entrance into the schoolroom had so pleasantly delayed the progress of their spelling-lesson.

The teacher cleared her throat as a modest hint that time was passing.

'It 's real perplexin'—there are that many of them; but if you would just bear with me a wee while. I never thought it would be so difficult to choose—oh, no' near so difficult!' Mrs Goudie said helplessly. 'If you would just have patience with me a minute, miss. You see, it 's no' a light matter pickin' out a bairn to adopt; it 's for always, ye see.'

'Certainly, certainly. By all means take your time,' agreed the teacher, something of compassion in her tone. Had the selection been left to her, she could easily have named the boy most likely to do credit to a good home; but when her advice was not asked it was decidedly not her place to offer it.

'It 's that difficult,' Mrs Goudie murmured again, passing her handkerchief over her heated brow; 'an' it isn't that I havena sought guidance, for I have that. But when I look at the bairns, they all look sae much alike that I 'm feared I may take the wrang ane!'

'Perhaps you would like to see the babies?' the teacher suggested, taking pity on her indecision.

Mrs Goudie gratefully accepted the suggestion. 'Well, if it wouldn't be too much trouble to you, miss.'

'Get your slates, boys; go on with your writing, and copy what I have written on the blackboard. I 'll not be a minute away.—Now, ma'am, if you 'll come this way.'

In a ward that smelt of soured milk and half-dried washing, four toothless old crones were nursing the infants. A cursory scrutiny served to convince Mrs Goudie that she did not feel specially attracted to any of their charges. And this fresh disappointment made her wonder if it was any lack of the true motherly instinct in herself that made her so hard to please.

She had fondly believed that, her husband's permission once gained, the difficulties of her

 [*All Rights Reserved.*]

scheme were ended. It had taken half-a-dozen years of gentle suasion, mingled with tearful entreaty, before that arbiter of her actions—that captious critic of her innocent desires—had condescended to give a tardy and grudging consent to her satisfying the craving of her empty heart. One would have thought Nature had fashioned Elizabeth Goudie for a mother. All the little living things at the farm were a joy to her, though her pleasure in their being was shadowed by the knowledge that early death necessarily awaited them. What her hungry soul demanded was a little child that she could love and care for—a human entity all her own, that she could comfort and cherish and *mother*. In the breast that now rose and fell tumultuously with the beating of her perturbed heart a vast fund of tenderness lay fallow.

The old wives, having learned her errand, were crowding round, each eager to exhibit her special bantling. The pallid faces and puny forms thus revealed bore little resemblance to the ideal babe Mrs Goudie's mind had formed during the sleepless nights when she had hugged the thought of possession close in her empty arms. Still, one refined little being, who slumbered as peacefully on the hard pillow as if it had been a cushion of down, attracted her as might some fragile flower seen blooming in the confines of a dark courtyard.

'That yin's a rale bonny wee lassie, ma'am. I'll bring her,' volunteered an old woman who had intercepted her glance of interest. She was hobbling off, when, touched by a sudden recollection, Mrs Goudie stopped her.

'My guidman couldna bide a lassie. He telt me I must bring hame a laddie or naething. An' I'm just mindin',' she said, turning to the teacher, 'that he was terrible particular that the bairn would be auld enough to run about his lane. He said he wouldna be fashed wi' bairns greetin' about the doors.'

'Suppose we go back to the schoolroom, then?' suggested the teacher. 'You'll maybe judge better on a second look. And I'm afraid the boys may be getting unruly in my absence.'

Her conjecture proved to be correct. They re-entered the classroom to find it a scene of confusion. On the floor lay a slate shattered to atoms, and in the front row a sleek, fair-haired urchin, actuated by a desire to call attention to his grievance, was blubbering loudly.

'Stop that noise!' the teacher ordered sharply. 'Who broke that slate?'

'Please, teacher, Ishmael threw his slate at me, an' hit me on the brow, so he did. An' I wasna doin' naething to him—so I wasna,' he bleated, ending with a wail that attested to his deep sense of injured innocence.

Casting a stern glance at a boy who sat erect in his place, his cheeks aflame, his dark eyes aglow with futile rage, the teacher, addressing herself to the class, asked for an impartial account of the preliminaries that had led to the outrage.

'What happened while I was out of the room, boys? Why did Ishmael throw the slate at Richard? What had Richard done to him? No—stop—don't all speak at once.—Peter Munro, you tell me.'

'Please, teacher, Richard Bird said Ishmael was to get another leatherin' after the woman went away. And Ishmael up an' frows his slate at Richard an' bashed him in the face, an' near put his eye out.'

'Stand out here, Ishmael. What have you got to say for yourself?'

The boy named Ishmael, moving with mingled reluctance and defiance, left his corner of the hard wooden bench, and stood before them—a pitiful culprit, straight of limb, but painfully thin, and with his dark hair cropped till it showed the white skin beneath.

As he stood speechless, confronted by accusing eyes, Mrs Goudie felt a thrill of sympathetic misery.

'Well, Ishmael, so you've taken advantage of my absence from the room to have another fit of temper. You threw a slate at a boy and narrowly escaped killing him. Is there any reason why you should not be well punished?' demanded the teacher.

'He said—he said'——

'Who said?'

'Richard Bird; an' he said you had bought new taws, for the old one wasna nippin' enough. An' it was me that ye were goin' to try them on,' the boy called Ishmael stammered out at last, speaking in a husky, panting voice. When he stopped, the injured Richard, who had ceased wailing to listen to his reply, broke into a fresh howl.

'Stop that noise, Richard. You're not killed. —Ishmael, go and stand with your face to the wall. I'll attend to you later, sir.'

As she looked at the offender standing apart, Mrs Goudie's heart melted in pity. Scanning the rows of callous young faces whose owners seemed to anticipate his promised punishment as an entertainment that would break the monotony of their eventless day, she had a feeling almost amounting to repulsion.

Between her unruly charges and the visitor's indecision, the teacher's stock of patience was almost exhausted. 'Now, ma'am'—her sharp voice recalled Mrs Goudie's attention to the matter in hand—'if you please, we'll get back to your business. That boy's temper is the plague of my life. I've tried all ways with him. But there's nothing for it but to flog the savage out of him.'

'But if the other bairns had been teasin' him?' Mrs Goudie hazarded tentatively.

'Oh, it's a poor disposition that can't stand a flout! Now, I don't want to single out boys, for I think you're better to choose for yourself;

but the boy, Richard Bird, that Ishmael attacked, is a boy that would pay for rearing. He is my best scholar. He is an orphan, too; his folks were respectable but unfortunate. He's a boy that would do credit to a good home.—Richard, bring up your slate to show to this lady.—See how neat the writing is, and how clean Bird keeps his slate!' she said appreciatively when the victim of the outrage stood, smug and self-righteous, before them, the rising bump on his temple bearing evidence of his wrong. 'If Bird goes on as he is doing he'll be in long division soon,' she added, as Bird went back to his seat. 'Yes, that's a boy whom it would pay you to train.'

But Mrs Goudie's eyes had strayed from the complacent Richard to where the untamable outcast stood, a forlorn little figure, his face turned to the wall, his vivid imagination picturing the punishment awaiting him. Something about the isolation of the child—the thought of his loveless existence—tugged cruelly at her heart-strings. To take the immaculate Bird by the hand and lead him away to a comfortable home, leaving the pariah to his judgment, was impossible to her. Yet surely one ought to choose a good boy!

Sore harassed by an energetic and domineering conscience, and torn by half-a-dozen conflicting emotions, Mrs Goudie paused, tongue-tied.

An impatient gesture on the part of the much-tried schoolmistress, her glance at the clock that marked the racing of the pregnant moments, passed unnoticed. Then, acting from sheer force of habit, the teacher rapped smartly on the desk with her ruler, and the sound recalled Mrs Goudie from her reverie.

'Well, ma'am, do you think Richard Bird will suit?'

'No. I've decided. I'll take the bad boy—Ishmael you ca'ed him.'

The shrewd gray eyes of the schoolmistress scanned her visitor with undisguised astonishment. Was ever mortal woman bent upon so suicidal a project? 'You surely don't mean'——

'Yes, I do. It's the laddie with his face turned to the wa' that I'm gaun to take, the one ye were goin' to gi'e the taws.'

'Well, it's not for me to attempt to guide your choice, and I must say it's a good Christian act you're doing in taking a poor friendless wean out of the poorhouse and giving him a real home; but I must warn you that you'll find the boy you've settled on a heavy handful.' Actuated by a sincere desire for the good of the generous-hearted woman before her, the teacher spoke bluntly. 'I've had Ishmael in my hands all his days, and, as I told you, I've tried humouring him and I've tried punishing him; and yet, in spite of that, when his temper gets the better of him he's like a mad wean.'

'Maybe if he was away from here—the laddies were teasin' him, ye ken,' Mrs Goudie demurred. 'And there wouldna be ony other bairns to ruffle his temper at the Hainings.'

'Well, if your mind's made up, you'd better see the governor and the inspector, and get their consent. What?' She smiled as she answered a whispered request from Mrs Goudie. 'Oh no! I promise not to lay a finger on Ishmael. He's yours now, you know.'

CHAPTER II.—A BLACK LAMB.

WHEN Mrs Goudie had journeyed to the poorhouse, on receipt of an official letter from the Parochial Board sanctioning her adoption of a child from those in its care, she had first seen the governor, who had passed her on to the inspector of poor. He, in turn, had introduced her to the schoolmistress; and, being a man of quite unusual discernment, had then departed on his other business, leaving her free to make an unbiassed selection.

What she offered was a home such as rarely fell to the lot of a pauper child, and the inspector would have been more than human had he not yearned, out of his skilled knowledge of the children under his supervision, to direct her judgment. But, besides being discreet, he was sportsman enough to stand aside and allow the selection to rest entirely with her.

Now that Mrs Goudie had rushed upon a conclusion, the inspector was waiting in his office to see her again, and to give his official consent to her taking away the boy she had chosen.

'You fully realise that in removing an orphan out of the care of the parish to which it is chargeable you assume full responsibility for its future guidance?' he asked. 'I know you have an excellent home to offer, and that any child you adopt will have great advantages and a splendid start in life. Still, in justice to yourself, I cannot allow you to consider the matter closed without warning you that we have found the boy on whom your choice has fallen unusually difficult to manage.'

'I ken Ishmael's a wee bit unruly, an' ower apt to flare up when the bigger boys take their fun off him. But, sir, he's just a wee, young laddie yet—not more than seven years old,' Mrs Goudie pleaded, feeling already a protective interest in the child. 'When him and me are by our lane, with naebody to anger him, he'll surely come to his senses.'

Tears of earnestness dimmed her sincere brown eyes; and the inspector, knowing there is no limit to what a loving heart may accomplish, offered no further protest.

'Can you tell me anything about the bairn,' she asked, a little nervously, when he told her that she might take the boy back to Pittendrevie with her, and that the matter would be fully

minuted in the transactions of the Board—'where his folk came from, an' that?'

The inspector shook his head. 'Very little, I'm afraid. He was born here—that much I know. It was before my day; but Dr Forbes will be able to tell you all there is to tell. He's in his room now. I'll take you in to see him.'

In the consulting-room, that smelt like the amalgamated essence of all the drugs in the *British Pharmacopœia*, the old doctor was bending over a fire, stirring a skillet in which simmered an ointment whose staple ingredient was evidently lard.

Dr Forbes had already heard of Mrs Goudie's expected visit to the poorhouse, so the inspector diplomatically withdrew, leaving her to falter out the decision at which she had arrived.

'Tut, tut, tut! to think of that, now! You came here once-errand to single out a laddie, and your election has fallen on our Ishmael! Truly the workings of Providence are unfathomable! Well, the Lord send that he may prove a worthy son to a good mother! I presume, mistress, that you'll be bringing him up in the fear of God and the knowledge of the Holy Scriptures? Ay, you naturally want to ken about his forebears. Well, I'll soon tell ye all there is to tell. Just about six—or will it be seven?—years ago, one black winter's night, a young woman was brought in here in sair extremity. She was worn-out, and after her wean was born we could do nothing for her; she just slipped away. I asked her her name, and where she came from; but she wouldna tell. All she would say was that the world had dealt hardly with her. Then I speired at her what she'd like the wean called. And she said, "Call him Ishmael, for every man's hand will be against him!"'

He sat silent a moment.

'Is that a' ye ken, doctor?' Mrs Goudie asked timidly.

'Ay, that's a' I ken, mistress, and I wish it had been mair heartenin'-like, for your sake. But here's the grip of good-fellowship, and may God speed your enterprise!'

Half-an-hour later Mrs Goudie, holding the little black lamb—he was scarcely big enough to be called a sheep—tightly by the hand, passed out of the poorhouse gates, and took a tramcar bound for the centre of the city.

As she looked at the child, whose sole worldly possessions were comprised in the coarse charity clothes he wore, a lump rose in the good woman's throat, and her whole heart went forth to him in pity. Putting out an arm, she sought—a little shyly, for 'mothering' was still strange to her—to draw him closer. To her dismay, she felt the little body stiffen with the involuntary shrinking of one who is unaccustomed to caresses, and who does not understand their meaning.

On reaching one of the principal thoroughfares, Mrs Goudie's first act was to take her adopted son into a restaurant and give him a good dinner. Though she carefully ordered the dishes she thought most likely to tempt a child's taste, it distressed her to see that Ishmael ate sparingly, as though he were suspicious of foods whose appearance and flavour were alike new to him.

The meal over, she went into one of the ready-made clothing shops, and, aided by the advice of an obliging salesman, bought Ishmael a complete outfit suited to the station she intended him to occupy. There were two knock-about suits for wearing at the farm, and a smart suit for use on Sundays, when they would go to church and sit together in the Hainings pew.

When the boy was clad from head to foot in brand-new raiment he seemed more unyielding than ever. Probably the unaccustomed garments added to his sense of strangeness, for there is something intimate and friendly about even the meanest of familiar and well-worn garb, compared to the harsh, uncompromising touch of stark, unhandseled vesture.

The buying of hosiery, linen, footgear, caps, had taken long. When the purchases were complete there was little more than time to drive to the station to get the last train for Fife.

Just as they were leaving the warehouse, the salesman would have handed Mrs Goudie Ishmael's cast-off clothes, which had been made into a neat parcel; but she resolutely waved it aside.

'No, no, we dinna want these. Ye can gi'e them to ony poor bairn ye see. This wee laddie 'll no' need them ony mair. He's comin' to stop wi' me.'

But Ishmael, who had already seized the bundle, revealed a disconcerting determination not to relinquish these relics of his past life. Grasping the brown-paper parcel with both hands, he clung desperately to it, and no amount of coaxing could persuade him to let go.

It was Ishmael's first railway journey, and Mrs Goudie tried to arouse his interest in what could be seen from the carriage windows. To her gradually increasing disappointment, her well-intentioned efforts found him outwardly irresponsive. Her most persuasive speeches met only monosyllabic replies; and already she was haunted by a faint doubt as to whether she had acted wisely in choosing Ishmael in the face of deterrent advice.

When they changed trains at Thornton Junction, Mrs Goudie, acting with a duplicity foreign to her guileless nature, contrived to leave Ishmael's bundle, with its tell-tale contents, behind. She had no wish to carry such irrefutable evidence of his past into the life before him. But when Ishmael woke up sufficiently to realise that his sole possession was gone, he revealed so strong a resolve not to proceed a step until it had been recovered that Mrs Goudie was obliged to return to the railway carriage they had left,

and draw the bundle out from under the seat where she had hidden it.

It was almost dark when the pair, travel-stained and weary, alighted at Braeside station. The day had been crammed full of emotions; and in spite of her country physique and training, Mrs Goudie felt exhausted, and unequal to the ordeal of the encounter with her husband that awaited her.

When she left the platform, holding Ishmael by the hand, John Goudie—who was sitting in his high dogcart in the station-yard—cast a coldly appraising eye over the child, as though he were some young animal of whose appearance the farmer had already formed a low opinion, and grunted.

'This is the wee laddie, John.'

There was a catch in Mrs Goudie's voice, a quiver of apprehension that might have softened a less callous heart. John Goudie ignored his wife's wordless appeal for sympathy.

'So that's the wee laddie, is it? Weel, mistress, dinna blame me if ye live to rue your bargain.'

'He's just a wee, wee bairn, John. And a'thing's strange to him, an' he's real wearied,' she said, looking down compassionately at the dazed white face beside her. 'He'll look a different laddie the morn.'

Again the farmer grunted contemptuously.

Stretching down a sinewy hand, he jerked the child, who still clutched his bundle, on to the footboard. Mrs Goudie climbed up without aid. The parcels containing Ishmael's new outfit were packed in behind, and the trap set off along the quiet country road. It was, perhaps, eloquent of Goudie's attitude towards the child that, in place of setting Ishmael between them, Mrs Goudie squeezed him in beyond herself, on the side farthest from her husband.

Supper was waiting when they reached the Hainings, the substantial meal of a prosperous farmer's house; but Ishmael seemed disinclined to eat. Perhaps the sugar-biscuits and oranges with which, on the journey, Mrs Goudie had stuffed his unaccustomed stomach had much to do with his abstinence.

When the farmer had gone down to the village to play his accustomed game of draughts with the innkeeper, his wife made the servant-lass get out the big wooden tub, and, having placed it in front of the parlour fire, fill it with soft warm water.

At the sight of what infantile prejudice made him esteem preparations for torture the waif uttered a protest. 'It's no' bath-night,' he said, and refused to submit. But Mrs Goudie wooed him with all her powers of persuasion, asking him to feel the water, and to see how warm it was, and to smell the scented soap she had provided specially for him, and to notice that the towels were already warming, with his new nightshirt, by the fire.

Then, tempted by some natural inclination towards cleanliness, the boy submitted, though he still preserved his attitude of gloomy antagonism.

Throughout his reception of her attentions Ishmael had been perplexingly mute. He had broken his silence only to protest when she tried to relieve him of the parcel containing his pauper clothes and at sight of the preparations for his bath. When she left him in bed, with the assurance that she would be sure to hear him if he called, for she would just be in the room beneath, he answered never a word.

Mrs Goudie had gone to bed feeling sorely perturbed. It was only after the house was still that she felt free to let loose the tears that, for the last hour, had been pricking her eyelids.

What she had done she had done for the best, she told herself. How could she have guessed that trying to bring sunshine into the life of one little child would prove so difficult an undertaking? Suppose she failed utterly? Had she done wrong to reject the boy who had been so highly recommended? Had she not acted rashly in bringing a child of such avowedly ungovernable temper into her home? But as she tortured herself by useless questions, with the recollection of the forlorn figure of the orphan child as he stood with his face to the wall awaiting the threatened punishment came the conviction that, had she the selection to make again, her choice would be the same.

She was just on the point of falling asleep when a faint sound from the attic caught her alert ears.

Stealing noiselessly from the side of her sleeping husband, she crept upstairs, to find that the end of candle had burned out and the attic was dark and silent.

'Ishmael!' she said softly—'Ishmael!'

There was no reply, but she knew that the boy was awake. Passing her hand gently across the pillow, she found that the child had drawn the blankets over his head, and that with a corner of the sheet stuffed into his mouth he was trying to stifle his sobs.

Sitting down on the bed and drawing the little body into her arms, she wrapped a blanket around it, and, resting the cropped head on her motherly bosom, held it close until the painful sobbing had ceased and she felt the rigid form gradually relax in sleep. But still she sat tenderly nursing her adopted son until the gray dawn began to glimmer through the attic window.

Then, gently laying him back on the pillow and covering him up, she stole away to her own bed, stiff with cold, but happy, to fall into a beatific slumber wherein a rosy, smiling Ishmael and she were wandering down by the burn gathering marsh-marigolds.

(To be continued.)

TITLES OF HONOUR.

By W. P. W. Phillimore.

THAT the Englishman loves a lord is a very ancient gibe, though it may be doubted whether in his regard for great men he differs aught from his cousins across the Atlantic or from his neighbours on the Continent. Here English lords receive more respect and consideration than do French or Italian counts abroad, doubtless because they are fewer in number and the status of a lord is correspondingly higher. After all, this so-called foible of the Englishman is not mere snobbery, as might too hastily be inferred. In truth, the root-basis of it is the same idea as the old copybook line: 'Keep good company.' The presumption in Britain is that a lord is almost invariably a synonym for a man of repute and position, whatever may be the case in foreign parts with regard to papal counts and Russian princes.

A title, then, is nothing more than an outward mark or sign roughly indicating the standing in the world of the man by whom it is borne, and naturally it is held in higher esteem the closer it approximates to his actual worth and position. Thus we may realise that titles are the legitimate outcome of that natural emulation which, fortunately, the most part of mankind possesses, and without which, indeed, we should be still living the lives of primeval savages.

Titles may be divided into two great classes: those which are professional or official in their character, being based, in a word, upon a man's occupation; and those which are of a purely complimentary character, arising from the natural desire we have to give honour where honour is due, and to compliment those of whom we think well. To the first class belong such titles as King George, President Taft, Colonel Jones, Professor Smith, and the like. In the other class are such styles as his Majesty, his Excellency, his Honour, the Worshipful, the Honourable, the Reverend, Sir, and Mr and Mrs. Most titles in both classes are purely personal; but, as we all know, certain of them are inherited, and descend from father to son. Some titles which were originally professional in their character, as Knight and Esquire, have become purely honorary in their application.

To attain any real and definite value, titles must necessarily come under the purview of the law, and be subjected to various regulations as to the manner of conferring and using them. In Britain it is a received maxim that the king is the sole fountain of honour. To the king, then, we have to look for the creation of the recognised titles of honour such as peerages, the various orders of knighthood, and the minor decorations which generally result in the use of certain mystic initials after one's name, with the concomitant possession of a medal or badge to fasten upon one's coat. All the same, the royal prerogative has not precluded the growth of 'courtesy' titles—that is, the use of titles for which, though sometimes permitted by general usage, there is no legal authority, or titles adopted for their own members by various semi-public associations.

For Jack is as good as his master, and often every bit as fond of styles and dignities. There may be no chance of gaining a knighthood or even the humble C.B.; but he can satisfy his desire for distinction in the ranks of various benefit societies and convivial clubs. Freemasons, Oddfellows, the Antediluvian Buffaloes, Druids, and Ancient Orders of Foresters minister to this harmless vanity with their varying ranks of Grand Masters, Worshipful Masters, Chief Foresters, and other principal offices created for this purpose. Even literary people have succumbed to this amiable weakness, and some London booksellers years ago formed a convivial club, the Society of Odd Volumes, the members or 'volumes' of which assume for themselves various offices or titles, and are ruled by a dignitary known as 'his Oddship.'

Hereditary titles of nobility in Britain maintain their value because they do not descend to all the sons of the family, as in other lands, but pass to the eldest representative. Our hereditary titles are six in number, and the questions relating to their styles and precedence and the children's rank and designation are so numerous that it would require a whole volume to deal with them. The baronets, who last year celebrated their three hundredth anniversary, have no privileges beyond their precedence and the prefix of Sir which they share with knights, and the addition of their rank as Bart. or Bt.

But the love of title is best exemplified in the peerage. Beginning with the baron, who is styled 'Right Honourable,' and with children who are 'Honourable,' we pass through various grades to the duke, who has the title of 'your Grace' or 'my Lord Duke,' and is given the sonorous, mouth-filling style of 'most high, potent, and noble prince.' Barons and earls are our most ancient titles of nobility; the dukes, marquises, and viscounts were not introduced into England until the fourteenth and fifteenth centuries. To the children of the higher grades of the peerage are given the courtesy titles of lords and ladies, though in formal documents a duke's or marquis's son will be quaintly styled 'John Butler, Esquire, commonly called Lord John Butler;' and in debates we are accustomed to hear of the 'noble lord' or 'my noble friend,' just as in the House of Commons they talk of the 'honourable member.' This style of 'honourable' appears to be the only dignity officially recognised in the United States.

There it is applied to ambassadors and members of the legislatures; but the title-loving democrat of the Stars and Stripes is equal to the occasion, and dubs his neighbour or himself 'judge' or 'colonel' as occasion offers—an excusable foible inherited, it may be, from his lord-loving British ancestors.

What is of most interest to the average citizen is the old and by no means extinct controversy as to the proper use of the title 'esquire,' and punctilious people often have much trouble of soul in deciding when to award it and when to withhold it in addressing their envelopes. The number of those who are legally esquires is really very limited; but the use of the title as a matter of courtesy, at any rate as far as the Post-Office is concerned, has become very greatly extended, until in practice it is customary to apply it to almost everybody above the rank of the labourer or the mechanic. Yet though the order of envelope-esquires embraces a constantly widening range, in legal and official circles the old rules are still pretty well adhered to, and only broken in upon in the case of men of more than average wealth and note. County justices, barristers, certain high officials, such as mayors, with the sons of peers, baronets, and knights, are lawful esquires, and are always so styled in legal documents; but by long usage, which it would be pedantic to ignore, the title is also given to graduates of the universities and to members of the higher professions, although as such they are technically outside that rank, and are simply gentlemen. Thus in legal documents it is usual to describe a solicitor, not holding other rank, as gentleman, though a curiously inconsistent usage has sprung up, chiefly in London, of styling him as 'esquire' in the endorsement of a deed. Outside the peerage and the other titled classes of knights and baronets, the ordinary British citizen, with two or three exceptions, has to rest content with the simple title of 'mister' in ordinary conversation, and the complimentary designation of esquire upon his correspondence if he happens to belong to any but the humbler ranks of society. It is remarkable that we never now write out in full the style Mr ——, which in the pronunciation 'mister,' customary in polite society, is merely a variant of the ancient Master, now by some strange freak reserved for schoolboys, certain high officials of the Royal Courts of Justice, and the heirs of Scottish viscounts and barons.

Members of the universities, if they have graduated in the higher faculties, are styled 'doctors,' a title which has been somewhat misused by its indiscriminate application in popular parlance to the whole of the medical profession, for which, indeed, it has become almost a synonym. In its origin and etymology it merely signifies a teacher, which style is obviously a most inappropriate one for the ordinary general medical practitioner. Still, in our use of words we are seldom logical, and we recklessly set the rules of grammar and etymology quite at naught, wholly disregarding the woes of purists and pedants. The modern university title of 'professor' is merely the equivalent of the medieval 'doctor,' and the identity of the two is illustrated in the occasional use of the initials S.T.P. (Sanctæ Theologiæ Professor) in lieu of the more familiar D.D. (Doctor in Divinity). In the older universities, too, is found an interesting survival of the older use of Sir. In the Middle Ages and down to the time of the Reformation, or later, Sir, the translation of *dominus*, was the usual style of addressing those priests who were not also graduates; Sir John, indeed, was almost the equivalent of an ordinary country priest. At the universities *dominus* (Ds.) is the official style of the Bachelors of Arts, which distinguishes them from those who have proceeded to the full degree of Master of Arts, the Magister or Mr, and indeed in some colleges it is still translated as Sir.

But for nice distinctions of title we must go to the Church and to the army and navy. There, indeed, fancy runs riot, and the various styles and complimentary distinctions form many a pitfall for the incautious civilian. In the matter of titles, indeed, the ecclesiastic easily takes the first place. They are arranged in a carefully graduated and ascending scale. In official documents John Smith, a clergyman, is described as 'clerk in holy orders;' but popular respect for his calling now prefixes to his name Reverend, and we know and style him the Rev. John Smith, though in eighteenth-century usage he was the Rev. Mr John Smith. But Mr Smith obtains promotion, and as dean of a cathedral is the Very Rev. John Smith; consecrated to a bishopric he becomes the Right Reverend Father in God, John, Lord Bishop of ——; as archbishop he becomes 'Most Reverend.' Moreover, by ancient custom, bishops and archbishops, even though not peers of Parliament, in their signature use, usually in a Latinised form, the title of their see instead of their surname. The archdeacon, who is the official *oculus episcopi*, has a special title, and we greet the Venerable John Smith, a style which is quite independent of all questions as to the archidiaconal age. Only the rural dean is left out of this delicately poised system of spiritual titles, and to the present time he remains Reverend, without any higher qualifying adjective, a hardship which led to the *bon mot* ascribed to Sydney Smith, that to the rural dean might very fairly be given the title of Rather Reverend. The latter-day democratic craze for increasing the number of complimentary personal titles has led to the practice of using merely official posts as complimentary designations, and thus we now are familiar with the Rev. Canon Brown and the Rev. Prebendary Jones. But this vanity is really of quite modern origin. The famous High Church leader of the middle of the last century was always known to his contemporaries as simply Dr Pusey, despite that he was one of the canons of Christ Church. 'Canon Pusey' would

have been quite unthinkable. The new invention of the dignity of the honorary canon altered all that, and perhaps rendered it inevitable that the name of this office should be commandeered for the purpose of creating a new dignity and style that the simple parish priest might aspire to. Society, lay and cleric, of late years seems to have been much exercised over the momentous question how to describe a peer's son who happens to be in holy orders. Years ago, when the Hon. Vere de Vere aspired to the family living, it was natural enough to address him after his ordination as 'the Hon. and Rev. Vere de Vere.' Now it is usual to write on his envelopes 'The Rev. the Hon. Vere de Vere,' a grotesque and ungrammatical form which converts the article into a conjunction, probably the invention of the penny-a-liner seeking variety of style when enumerating the notables present at some local junketing.

In the army the various gradations of rank afford an almost endless range of titles. Beginning with the humble ranker Private Smith, and the non-commissioned officers Corporal Brown and Sergeant Jones, we mount up until we reach the illustrious dignity of 'the Right Hon. Field-Marshal Earl Roberts, O.M.' It is customary, following legal and clerical analogy, to apply to soldiers, at any rate in debate, the complimentary adjective 'gallant,' though we are saved the trouble which would attempt to measure out the amount of gallantry we may ascribe to the individual. We talk of 'the gallant captain,' but fortunately custom does not demand from us that we speak of 'the very gallant colonel,' 'the right gallant general,' or 'the most gallant Field-Marshal.' It would be a nice question for military casuists to decide at what rank we may begin with the title 'gallant.' May we begin with Tommy Atkins, and speak in barrack debates of 'the gallant Private Atkins'? At the officers' mess such a suggestion would doubtless be scouted, and it might even be questioned whether the budding sub-lieutenant could claim the quality of gallantry.

There exists a custom of promoting an officer on retirement to the next higher rank by way of compliment; thus a lieutenant in the navy retired under the age-limit obtains the brevet rank of commander by the sea. Forthwith his friends go one better, and dub him with the superior but more familiar higher grade, and he is soon known generally as captain by the sea. The wish to recognise long and faithful service led, a few years ago, to the creation for the benefit of the 'services' of V.D. and D.S.O., the first-named being for long service in the Volunteers, the other being the Distinguished Service Order. Doubtless they have their use, as also the untitled divisions of the various knightly orders, such as C.B. and C.M.G., which, with an accompanying badge to pin on to Court dress, are given as a reward for long years spent in the Civil Service.

The status of the regimental surgeons was long a sore point with the medical profession, as witness the pages of the *Lancet* and the *British Medical Journal*. The difficulty at length was surmounted by giving them the same titles as the officers themselves, and now we are familiar with surgeon-captains and surgeon-colonels, an innovation which not infrequently puzzles the ordinary citizen when introduced to Captain This or Colonel That.

If we look at the legal profession, though the ritual of dress is preserved in an elaborate form in the higher grades, yet it became rather otherwise in the matter of styles, for since the famous Judicature Act of 1873 the tendency has been to lessen their numbers. At the present time the three main ranks of the profession are solicitors, barristers, and judges; but before 1873 we had attorneys-at-law and proctors, as well as solicitors. Amongst the barristers we had, besides the K.C.'s, with whom we are now familiar, the Serjeants—members of the now extinct order of the coif, whom the judges addressed as 'brothers;' and with the passing away of the Court of Exchequer we lost those mysterious members of the junior bar, the 'tubman' and the 'postman,' the latter owning no allegiance to His Majesty's Postmaster-General. Greater variety of style also distinguished the judges. Then we had the Barons of the Exchequer, with their Lord Chief Baron, as well as in the Court of Chancery the Vice-Chancellors, who, however, were but a short-lived order, dating only from 1813, and being ended some sixty years later.

The judges of the higher court are usually knighted after their appointment, and are styled the 'Hon. Mr Justice So-and-so,' and when sitting on the bench are deferentially addressed as 'my Lord.' All judges, as well as the counsel or barristers, are accounted 'learned,' and by custom are spoken of as 'the learned judge' or 'the learned counsel,' in the same way as we have seen that officers are 'gallant' and clergymen are 'reverend,' an adjective in Coke's time commonly applied rather to the judges than to the clergy. The County Court judge, a creation of the Victorian era, is now styled 'his Honour Judge ——,' and is addressed in court as 'your Honour;' while the minor judges, the mayors and the magistrates, are 'worshipful,' and are spoken to in court as 'your Worship.'

Scottish lawyers are perhaps more logical in the matter of titles, for the superior judge is not merely a lord on the Bench, but on his appointment assumes a lordly title based on the family name of his estate, and is styled 'Lord So-and-so,' just as if he were a peer of the realm. He is not, like his English brethren, plain Mr Justice So-and-so.

Albeit the variety of titles of honour in use for men is bewildering even for the expert, yet, strange to say, in this respect, for women simplicity reigns. Outside those higher ranks of society in which ladies, countesses, marchionesses, and

duchesses do abound, the advanced woman may discover another feminine grievance in that she has the choice of but two titles, Mrs and Miss, save in the exceptional cases of lady mayoress and ladies who have become Doctors of Medicine. The title of Mrs (still pronounced by old-fashioned Scotch folk at length as 'mistress,' though the younger people follow English usage, and contract it briefly as 'missis'), was once reserved to women of fair social position. The humbler ranks were known as simply Mary Jones or 'Goody' Jones, an abbreviation of 'goodwife.' All such social distinctions have now disappeared, and even the servant-maid will deem herself slighted if on her letter she be not styled 'Miss' like the daughter of the house. This last term has a somewhat curious history. Apparently in its origin an obvious contraction of 'mistress,' it was at first chiefly used in a disparaging and derogatory manner rather suggesting that a lady to whom it was applied was no better than she should be. But 'miss' has fared better than many other words, for it has become highly respectable, and is now the recognised style for all single women except the limited few belonging to royalty or the higher ranks of the peerage. But there are signs that in this matter of titles women may be coming to that equality with men which they claim in other ways. For of late years we have become familiarised with the Ladies of Grace of the Order of St John of Jerusalem, and the needs of a political party have given us the Dames of the Primrose League. Whether in the future every masculine title will have its feminine analogue time only will show.

It would be easy to enlarge upon this subject; but one point, it will be seen, stands out clearly, and that is that there is a solid basis of reason for this well-nigh universal use of titles: the desire to render honour where honour is due.

THE CAHUSAC MYSTERY.

By K. and Hesketh Prichard, Authors of *Roving Hearts*, *Don Q*, *Tammer's Duel*, &c.

CHAPTER XVI.—A REVELATION.

AFTERNOON. Outside, the thunderstorm had just ceased, but its low mutterings could still be heard in the distance. The drenched streets and gleaming pavements impressed the senses pleasantly with their unwonted freshness. The smell of wet earth and grass greeted Lorrie Madesson as she crossed the broad street into Kensington Gardens.

She was fond of her own company at all times, and of late the taste seemed growing upon her. There was a quiet walk she frequented a good deal in those days, a straight walk on the verge of the Gardens terminating near Kensington Palace. Her past life was very present with her on this evening—her happy girlhood, her mother's death, and her almost immediate marriage to a man whom she genuinely liked but could never have loved, a marriage which was the outcome of a passionate horror of her new loneliness. She had given devotion and loving service to her mother, a delicate and brilliant woman, of the true American type; and afterwards she was the more ready to devote herself afresh to the clever, morbid man who became her husband.

Later she understood her mistake. With Madesson the yoke of loving-service galled, and she reproached herself always that his death was less lamented than it should have been. But her experience had developed her nobly into a full and rounded life, self-dependent, wise, too, when she chose to be so; but she had learnt to regard the narrow conventionalities at their real value. She meant to live according to her own theories, and the high tide of life within her bade her live to secure some tangible good and satisfaction for herself. And society resented this independence, after its own fashion, with innuendo and sneer, but not with neglect. Lady Madesson was too beautiful, and with a certain section too popular, to be omitted from its functions.

The keen scents following the rain had awakened these old thoughts of the past; but it soon slipped away into its own place behind her, and the eager, pulsing present rose instead.

The figure of Malcolm Cahusac had for some time past come more and more prominently into her foreground. A chance association of ideas led her mind away to Lancelot and Tristram as Tennyson paints them in their equal sin and in their immeasurable differences—remorseful Lancelot, who never changed, who was loyal even in his guilt; and Tristram the hunter, debonair and lightly passionate, with his creed of 'we love but while we may'—Tristram, who could not glorify even his sin by constancy.

Malcolm Cahusac was no Tristram; who won his love must keep it. Alice Lanceley was surely too slight a thing to fill his heart. Lorrie knew him to be great because of the hidden battle of his life. In his youth he had chosen the harder part—to face trouble, not to leave it behind; to wait with a patient fortitude that seemed almost impossible even to her, a woman. Out of a strong comprehension of all that his quiet gallantry must have cost him, she had been moved to offer him her help. She put him upon his guard, and he had gone out trusting to himself, only to find his foe. Proud and self-contained, he asked no aid; nor did he come to her, as other men as self-con-

tained might have done, to claim her promise, but also as a cover for pleasant companionship and increased intimacy with a beautiful woman. Adversity had welded his qualities into a rare amalgam, harder indeed, and perhaps not so pure, but in her estimation more precious than gold.

The point, of course, to which all her reasonings led her was the inevitable one—he was worth loving. Lorrie Madesson knew her world, and knew, therefore, how rare such men are. But, alas! the outcome of the matter lay not with her, but with him. Was he one of those who look for something beyond unreasoning love; who, in fact, would have their wives love them with their hearts indeed, but also with their intelligence? The thought troubled her. She knew him well enough by instinct in one way, but very little by intimate association in another. She had little to guide her. The question was vital, but she must wait for the reply.

She had met him constantly, and their acquaintance had much advanced since his return from Paris; but he had not referred in any way to the errand which took him there. She knew that he had been worse than unsuccessful, for the story of Park Lane had been revived and amplified and commented upon indefinitely since that time. He suffered in silence and alone. At times she longed to give the aid and companionship he must need, and yet she liked him all the more for the fine reticence that held him solitary.

The trees had ceased to drip; and Lady Madesson, finding a couple of chairs, took one, for her thoughts weighed upon her. She wished to see her way more clearly through the mists of conjecture and feeling.

As it chanced, Cahusac, after hesitating for a moment at the Broad Walk, turned into the same path. To his relief, he saw no one along its length, for the rain had driven away the usual loungers. He walked slowly, his eyes upon the ground, his whole figure unstrung. To the most careless passer-by he must have suggested a man acquainted with grief.

Lorrie saw him afar off, but did not at first recognise the listless hang of his shoulders and his changed bearing. He came nearer, and would have passed without seeing her, but since fate had flung him so near she was not going to allow him to drift by.

'It is getting late. I rather want some one to see me home, Mr Cahusac,' she said, rising.

Cahusac started. Then, most unwillingly, it must be owned, he raised his hat and approached her. 'I did not expect to meet you here.'

'Pray don't try to lower my poor vanity. I know that perfectly! All the same, I see you are tired; sit down and rest for a moment.'

There was nothing for it but to accept her invitation; but, once seated, he felt glad of the respite from movement, for he was singularly weary. A recollection of their last meeting before he went to Paris oppressed him. He felt he must allude to it, yet shrank from doing so.

'I found out a little in Paris,' he began at last. 'I dare say you know the *Gas-Lamp* relies for its information on *L'Œil*.'

Lorrie nodded. 'Well?'

'There is nothing more to tell, only that I found a man in a garret crying for the moon.'

'What do you mean?'

'He was a man who has written a play—a wonderful play, I really believe, though he said no one appreciated it. I heard him declaim the lover's appeal to Astoreth.'

'But'—— She stopped. Cahusac provoked and baffled her. He remained silent, but there was an air of exhaustion in his attitude which disarmed her.

Then Lorrie Madesson talked to him softly, while he leant back, pleasantly soothed, and listened with a growing sense of relief from mental pain.

By-and-by he found himself looking at her. She was dressed all in white, and her outline shone out against the dark-green background of branches. Her beauty had stirred him before to-day, and now she seemed more lovely, and even more interesting, than ever. As she talked she smiled occasionally, and her smile flashed in the shadow. Yes, he reflected lazily, Detching was right! What a good comrade, what a companion, this woman could be!

Lady Madesson saw the slow revival of his spent strength, and afterwards of his interest in herself. She gave him time to recover completely.

'Surely you do not agree with that,' he said carelessly, in answer to some laughing talk of hers. 'You do not think marriage spoils a young man's career?'

'Very often it does.'

'Why?'

'Partly because woman's love—the love of the average woman—is horribly selfish.'

'You will forgive my saying that I, as a man, think so; but I am surprised to hear a woman acknowledge it. Why is it so selfish? A mere man could never come upon the answer to a problem even so common as this one. The old hackneyed phrase is true. Women are a mystery we fail to fathom through all the ages.'

'Is that why you are so apt to prefer the shallow women?' she asked rather quickly.

He felt the prick of the question; it roused remembrance. 'I suppose we prefer what we can understand most of,' he replied.

'And you do not care to be understood in return? Are men so ineradicably vain that they prefer to be worshipped blindly?'

The subject was encroaching too near to reality. He laughed. 'I suppose we enjoy worship. It is one of our most contemptible weaknesses. But you promised to explain the other problem to me. Men don't interest me. I know so much about them, you see.'

Cahusac had thrown off his depression; he felt cheered; his companion always had the power to stimulate him. Besides, he admired her very particularly. He felt the influence of her strong, intensely human, and imaginative nature; his mind responded to the worldly-wise and world-loving side of her character. He often caught himself wondering how a woman of her slenderness could be so commanding. Her face, in spite of its full, firm lines, might have been the face of a girl but for her eyes. Her eyes held a history. They made manifest her powers, and perhaps her limitations. She was strong, too, with the sympathetic strength a man can trust to and lean upon without losing self-respect. And, above all, she understood.

And what had Alice Lanceley to pit against this widowed girl-woman's qualities, her knowledge of life, her glowing beauty? Alice had beauty too, and ideals yet undimmed in their innocence and singleness of thought; the bloom was on the fruit. She compelled a loving pity where the other compelled adoration. For Lorrie, her weakness was in her strength; for Alice, her strength lay in her weakness.

It was some time before Lorrie answered, and even then Cahusac, wrapped in his own thoughts, hardly heeded. The first words he heard were: 'It is the conventional idea which is all wrong. We are very much what the prevailing set of opinions amongst our intimates makes us. A girl from the moment she is engaged leads about in public the man who has chosen her. The average woman's instinct is to love selfishly. "He is mine," she says, and spends her life in proving it before the world. He does good work, let us suppose. The average wife allows it, delights in it, but her thought is, "My husband is great."'

'But look at the reverse picture,' he argued; 'very few men are big-souled enough to endure that their wives should be greater than themselves.'

Lady Madesson's eyes gleamed. 'I don't blame them for that,' she said. 'Besides, it always works out wrong in the end.'

'Things go crookedly if a woman is captain—is that what you mean?'

'Yes. No woman who really believes herself greater than her husband can go on loving him.'

'Is not that heresy at the present day?'

'I suppose so. But I am not talking of women as they talk of themselves on platforms. I am taking them as I find them in the mass.'

'But we are getting away from our subject—the selfishness of love.'

'So we are!' She smiled and considered a moment. 'The generally received idea as to what constitutes love is wrong. That is half the mischief. Take two instances. A wife who makes her husband send in his papers on the eve of active service is called loving. It is said she loves him too much to let him go into danger; while another who will not hold him back from his duty, who makes no fuss, but who waits and prays and hopes, who cheers and strengthens him with talk of future meeting and promotion and glory—she is considered cold-hearted, to say the least. A selfish affection parades itself; it clings and forbids and weeps; and it is magnified by public opinion, which is always in a hurry and judges by the eye only, while it condemns the true love which refuses to indulge itself at so heavy a cost to its beloved.'

Cahusac was thinking of Alice again, but with a lenient tenderness. She could love, dear little girl! even if she could not discriminate between the false love and the true. Faulty reasoning, perhaps, but such as serves with most men.

'And what is the result as far as the man is concerned?' he asked presently.

'If he is easy-going it destroys his moral fibre. If he is not—Heaven knows! The common idea of woman's love turns it into a vice, nothing less. How often do you hear women say, "There are plenty of single men; let them go and be killed!" We have ceased to say, "I could not love thee, dear, so much, loved I not honour more." Women marry men nowadays to enfeeble them, it seems to me.'

Cahusac took off his hat and ran his hand over his hair as he answered with a smile, 'And men like it sometimes, you know. It is restful to be let down easily.'

Lorrie looked at him. 'You are thinking of somebody in particular, and speaking from his—or rather her—point of view,' she said.

Cahusac's guilt appeared in his eyes. 'How could you guess that?'

'Because you yourself are quite otherwise. I should hate you if'——

'Don't hate me,' he said lightly. 'I am young still, you know. Let me enjoy as much of life as I may!'

The tone fell cold upon her warm mood and checked her. 'Do you wish to live to be old?' she asked suddenly.

'Good heavens, no! What an awful idea!' He was in bitter earnest now.

'Nor I,' she said. 'I have often thought I should like to die when I am in the full flower of my life, before I fade. Do you remember what Tristram says?—the saddest lines on earth, I think:

May God be with thee, sweet, when old and gray,
And past desire.

You, at that age, will still have your work and your career and your ambitions. What shall I have, for example? Only my eyes, my face, my hair, fading—surely fading—while every year a new wave of beauty rises.' Her tone held regret, but no echo of feebleness asking for pity.

'There remains the beauty of the mind,' Cahusac answered with a keen consciousness of the antiquated inanity of the remark.

'The mind!' laughed Lorrie. 'And what

does a man care for the beauty of a woman's mind? What will you give for the beauty of the mind?'

'Respect at least.'

'Yes, respect and pity, much as the Roman gave respect and pity to his sculptor or his painter slave. The mind! But what is the good of talking about it? We all know that it is most frequently just its own reward, no more, no less.'

'But a woman cannot be beautiful without a soul.'

'Nor can a woman be soulful in a man's eyes without beauty!' she retorted. 'If she is, the quality is called by other names—cant or affectation; any epithet is good enough to give it.'

'Well, it seems to me I can account for that. The greatest soul rarely gives a glimpse of itself to the multitude,' said Cahusac.

'Is it not a species of immodesty to bare the soul?' she retorted, falling in swiftly, as usual, with his thought. 'Physical beauty is on the outside; the beauty of the soul is sacred to one. You know, as Holmes says,' she went on more lightly, '"We are different persons to each of our friends." The Lady Madesson Monsieur de Sarsan knows is not Wilford's Lady Madesson, nor is Wilford's Lady Madesson the woman you think I am.'

'But you—why will you make yourself so different?' The words were out before he was aware.

She ignored his direct meaning, which might have been translated into a reproach.

'Self-screening is a species of soul-modesty,' she replied. 'Not two women in a generation lay bare their souls, thank Heaven!'

He had always known that she was the incarnation of something—something whose name was hidden from him, but which dwelt behind the laughter and the brilliancy, the endless varying changes of her eyes. As she spoke the unseen veil between them seemed to drop. His look plunged deep into her real thought for a second. It was a revelation. But she would not suffer more. With a swift movement she turned her head away.

'Why?' The question which sprang rather from the interchanged look than her last words meant much to him at the moment.

'The body perishes,' she answered, 'but the memory never perishes. Who would reveal herself to one unworthy? But between two equal souls who loved equally self-revelation would be the beginning of eternity! See? How late it is! I must go.' She rose hurriedly and walked away.

(To be continued.)

CALIFORNIA'S DESERT.

THE desert is not officially listed as one of California's attractions. You would look quite in vain for a description of it in the parti-coloured and voluminous literature of the Southern Pacific and Santa Fé railway lines or trans-continental lines either. The section—which, as a geography would say, is bounded on the north by Nevada, on the east by the Colorado River, on the south by the San Jacinto (Wacinto) range of mountains, and on the west by the Sierra Nevadas—looks on the map much like the rest of California, unless you happen to notice such names as Death Valley, Pilot Butte, Funeral Mountains, Furnace Creek, Dead Man's Point, Bitter Springs, and other appellations of a similarly suggestive ill-omen.

The eastern man on his vacation boards the train, laden, in addition to his maps, guides, and folders, with a vague but roseate preconception of what California will be like. It is one in which figure largely orange-groves and sun-kissed meadows, vine-clad hills and rolling wheat-fields, giant rose-trees and a riotous profusion of semi-tropical verdure. He knows these things are so, because his enthusiastic friends newly returned from the land of sunshine have vividly described them to him. California is California, and no sooner has the big 'double-header'—a train driven by two engines—poked its snorting nose across the border of the Golden State than he is peering anxiously from the car-window. Is he perhaps awed by that vast expanse of yucca-trees, Joshua sage-brush, and greasewood or creosote-trees? Not at all; he is looking for a palm-tree. From the Needles to Cajou (Cahoou) the thirsty and expectant traveller is made keenly aware of hours and hours of waterless wastes. He may refuse to heed them, and to that end bury himself bodily in the latest magazines; but the desert will not be denied. An all-penetrating cloud of gritty, sneezy dust sifts freely through airtight double windows, and settles familiarly on him and his. The sun peers curiously through the panes, and finding only a close-drawn curtain, beats furiously upon those excellent heat-conductors with torrid and wilting effect. The observation platform affords, through a whirling dust-fog, glimpses of life limited to a few scuttling lizards, a multitude of jack-rabbits, and an occasional coyote sitting on his haunches and watching the clattering intruder with an indescribable air of boredom. Now and again the train pulls to a reluctant stop, panting thirstily beside one of the infrequent water-tanks.

The towns that cluster about these desert 'water-stops' have an individuality not entirely due to their picturesque population. Generally in the little crowd about the station there are a

few who await the train as passengers. These are of all sorts, and the transient population of the desert is an oddly mixed one. Among them is the prospector, one not to be readily mistaken even by the eye unaccustomed to these nomads of the mountains and foothills. From his grizzled face, leathered by long acquaintance with the sun and sand, to his high-laced 'surveyors' or mountain-boots, he looks the part. His right shoulder sags even without its accustomed burden of a pack, his corduroys are streaked and grimed with pot-black, his hands are eloquent of single jack and pick, and to remove all doubt his pockets bulge with rock-samples. Denude a prospector of his tools, remove him forcibly from his natural environment, invest him—if you can—in pocketless evening-clothes, and he will chip samples from the stone coping with your best opera-glass, and secrete them in his top-hat. He has the habit. Contrary perhaps to the general impression, the 'white Arab' is seldom morose or taciturn. Nine-tenths of his life is spent in silence and solitude, with no other companion than a pack-mule or burro (donkey), whose speech is limited to two startling syllables; but the fluency and freedom of his own speech are in no wise impaired by long disuse, and it is not difficult at all to engage him in conversation. He will probably try to sell you an El Dorado of his own locating, and he will frequently need diverting or switching from the tiresome jargon of lead, ledge, and strike; but in his own way will tell many things that are worth listening to. They lose nothing by the crude directness of the telling. Don't make the mistake of supposing him to be the victim of circumstances, or venture to commiserate him upon a life condemned to hardship and desolation. He would tell you, though in more forcible idiom, that those to be pitied are those whose bread and butter require that they live inside of fences. He has small use for cities or civilisation. Seen at close range or heard at first hand, the life of the average prospector hardly seems to justify his choice or to reflect credit upon his judgment.

The quest of the nimble pay-streak is a picturesque one, but more picturesque between the covers of a magazine than elsewhere. The annals of mining districts are full of tales of lucky strikes, of wealth uncovered by a single blow of a casual pick, of mines worth millions stumbled upon by the merest chance. The other side of the shield is less attractive. For every man that has achieved wealth or even a competency in the toiling search there are a hundred who have not even the price of a fresh grub-stake to show for years of hard work. Out of the thousands of claims in a single district a ridiculously small percentage have even paid the recording-fee. Of those whose ventures are built on the great American principle of taking a chance, the prospector is the biggest gambler of all. On the elusive possibility of some day making a big strike he is risking more than his time and labour, or the bacon, beans, and flour that constitute his grub-stake. Even for the hardiest and most experienced, the desert harbours a multitude of pitfalls. Any one of a score of accidents away in the wilds—a way mistaken, a distance miscalculated, a trifling sun-sickness, a leaking canteen, a misstep on the rocks, a lurking reptile—may make a heap of bones the grisly monument that marks his last claim.

A case in point was that of Superintendent Perry, of the Dagget Borax Works, a man thoroughly acquainted with the desert. He started on horseback from Leach's Point, carrying an ample supply of food and water, and travelling a plain and perfectly familiar trail. Some hours out his horse showed signs of sickness, struggled a short distance, and finally fell under him. Perry did everything possible to restore the animal, but it died within an hour. The trip was imperative, and he determined to complete it on foot. His canteen still contained water enough to get him easily to Hidden Springs, where he could get a fresh supply. Late in the afternoon, as he was trudging along through a rough piece of trail, his alert ear caught the warning whir of a rattlesnake close to him. He leaped to one side, stumbled against a projecting point, and fell, bursting the canteen against a sharp rock. Its contents were instantly sucked up by the thirsty sand, less than a mouthful being left. Holding this in his own shadow to lessen its evaporation, and moistening his lips with stingy drops at intervals, Perry pushed on toward the Springs, now about forty miles away. By nightfall his tongue was so badly swollen by thirst as to protrude from his mouth; at eight o'clock, completely exhausted, he lay down in the trail, where an hour later he was picked up in a semi-delirious condition by the driver of a borax-team. The coming of this team, without which Perry would undoubtedly have died where he lay, was a mere chance. It had been delayed earlier in the trip, and on the trail was twenty-four hours behind its usual time. In commenting upon the experience, Perry remarked that he sat up until twelve o'clock that night drinking water.

To one whose thirst is quenched from a nickel-plated tap the bare facts of what lack of water means in the desert's kiln-dried and blistering heat sounds like fanciful exaggeration. In the sink of Death Valley, two hundred and fifty feet below sea-level, where the mercury rises to one hundred and thirty degrees in the shade—without any shade—and the humidity falls to less than 1 per cent., men have gone insane with canteens less than an hour dry. They have fallen and died a scant quarter of a mile from a flowing spring. Dementia is, in such cases, an almost invariable precursor of the end; it manifests

itself strangely and seldom twice alike. Near the head of the grimly named Paradise Valley, stretching from the north to the Calico Range, is a large yucca-tree under which is a great heap of boulders, and nailed to a stake beside it is a pine board bearing the pencilled scrawl, 'Grave of John C. O'Brien.' They found him there, his arm still outstretched in a great hole he had made with no other tools than his hands, torn and stripped fleshless in his frenzied digging for water. In that strange well they buried him, and piled stones above to guard against the prowling coyotes.

Desert lore is replete with legends of great finds made by men in the hour of extremity and never rediscovered. There is a family similarity about these tales suggesting that, if not wholly mythical, they are at least patterned after a common model. The great Peg Leg Mine is such a one; another the famous Breyfogle Butte, which, as the story goes, is a huge mass of quartz in which nestle lumps of virgin gold like raisins in a pudding. More famous than either is the outworn tradition of the lost Gunsight Lead, in search of which particular wild-goose scores of men have gone and not a few have lost their lives. The man who originated the remark that there are 'grafters' in every business under the sun might have reasonably expected to find an exception in that of prospecting. Its fruits, barren enough when legitimately attained, would scarcely seem to offer any temptations to the easy-going person who toils not nor spins as long as there is credulity to be imposed upon. But the grub-stake eater is a 'grafter' pure and simple. To some likely tenderfoot, unsophisticated in the ways of the desert, in the character of 'guide, philosopher, and friend' he unfolds, in strictest confidence, an alluring proposition. Prefacing it with some such legend as the Gunsight Lead appropriately adorned, he sets forth that he alone is possessed of knowledge whereby with but little search he can relocate the lost bonanza. He proves it by a minute description of a territory he has happened to come across, with a host of convincing details which naturally tally to the smallest particular with those of the original story. He adds, with proper indignation, that up to that time he has found no one he can trust with the great secret. If his new friend, whom he can see to be a man of judgment and discretion, will back and grub-stake him, he will guarantee to make both of them millionaires. If the new friend catches on, as with skilful handling he is apt to do, the pseudo-prospector presently sets forth with a complete outfit of tools, burros, blankets, and rations for sixty or ninety days. He disappears into the hills, and thence unostentatiously retires to some obscure haven of rest, where he proceeds to justify his name by consuming the grub-stake in peace and comfort. Needless to add, he wastes no time in futile searching for the lost treasure. The rations gone, he returns, taking with him a number of appropriately rich ore-samples which he has thoughtfully provided beforehand. These he submits to his backer with as vivid a tale of hardship and suffering as his fat and sleek condition will not too obviously belie. The samples are secretly assayed; and the tenderfoot, overjoyed at the result, needs little persuasion to provide another and more expensive outfit, together generally with a little hard cash for the opening and development of the new claim. The second trip is essentially a repetition of the first, with the minor exception that this time the grub-stake eater never reappears. One advantage of the device, from the latter's point of view, is that not for months, and frequently never, does the victim awaken to the fact that he has supported an imaginary benefactor in idle luxury—desert luxury—for anywhere from three months to a year.

Although the prospector of accepted fiction is invariably associated with the search for precious metal, his attention is by no means confined to this. The modern knight of the short pick depends on more than mere haphazard luck and rule-of-thumb. Endurance and tenacity, indispensable as they are, do not weigh in the balance against a practical and working knowledge of mineralogy, petrography, and geology. A group of the most valuable claims in the entire Silver Mountain mining district are those which include Black Mountain, an enormous mass of impure limestone thrown up by some geological freak in the midst of hills of shale. It was long considered worthless until a more up-to-date prospector recognised it as 'cement rock,' the principal ingredient from which Portland cement is made. The value of such a deposit may be realised from the fact that Southern California alone uses a million and a half barrels of Portland cement yearly in buildings, paving, and irrigation-ditches. Another example is furnished by the story of the discovery of borax in Death Valley, one of the most valuable strikes ever made in California. The discoverer, Aaron Winters, was at the time living in a little lonely shack on the Amargoza Flats at the south end of the valley. Thither, attracted by the light, came one night a vagrant prospector from Nevada. He had with him a sample of borax brought from a small deposit across the border. This Winters instantly recognised as being the same kind of curious stuff he had seen lying in great beds in Death Valley, but of which he had never known the name. Adroitly questioned, the garrulous wanderer presently explained to Winters the simple but little-known test for borax. No sooner was their visitor safely gone than Winters and his wife, carrying a little food and water, a pick, a saucer, and a bottle of alcohol, set out on foot northward into the valley. At nightfall the next day they arrived at the first of the strange beds. Without waiting even

to moisten his parched throat, Winters fell upon it with pick and bare hands till a little of the surface crust was removed. He scraped up a handful of the loose stuff, piled it in the saucer, moistened it with alcohol, and struck a match. An instant later he hurled his hat in one direction, his pick in another, and seizing his wife, waltzed that astonished woman around the strange flickering flame, whooping, 'She burns green, Rosie! She burns green, Rosie!' Winters realised a comfortable fortune from his discovery, though it was small compared to others made from Death Valley borax. Even to-day the man of the valley lighting upon something new heralds his find with the classic yell, 'She burns green, Rosie!'

Much of the desert's interest, at least for those at a distance, centres about its peculiar and characteristic fauna. Of these original natives the festive jack-rabbit is far and away the most numerous and familiar; of his characteristics the far-awayness is most noticeable. In this connection it may be mentioned, in a hoarse whisper, that during the Belgian hare craze of a few years ago many a young and succulent jack from the Mojave and other deserts masqueraded on Angeleno tables under the name of his patrician cousin. The rabbit is subject during the summer months to a peculiar ailment which, together with the tick, kills him off by thousands; but, like the house-fly, he never gets any fewer. Second place goes easily to the coyote, who, by the way, pronounces his name *ki-ote* in the desert. Those who have not heard the weird psalm of this desert songster, wrung from his heart on some distant butte in the full of the moon, have still much to learn of the sad and lugubrious. His cunning is notorious, and it is even asserted that when the San Bernardino Company offered two dollars fifty cents each for his several scalps, the coyote read the notices and moved to Nevada. Even his circumspection is, however, not proof against the toothsome allurement of an auger-hole filled with lard and strychnine, and it is thus that the coyote is mostly despatched. Most dangerous in the list is the rattlesnake, excepting only his half-brother the side-winder. The side-winder is a vicious cross between rattlesnake and viper, betraying his kinship to the latter by his size, which rarely exceeds eighteen inches, and by the horns he wears above his eyes. Instead of crawling, he travels by a peculiar side-flopping movement, from which he gets his name. He strikes without coiling, and his rattles are so faint as to be nearly inaudible. Both snakes travel in the cool of the night, and both have a disconcerting fondness for snuggling into the blankets of outdoor sleepers. Lizards are very plentiful, mostly of a small and extremely agile variety. The gila monster—the only venomous member of a large family—is less frequently met with. The chuckawallah is a very large lizard, sometimes attaining a weight of several pounds; he is vastly ugly, even for a lizard, but his flesh is edible, and, roasted whole between hot stones, the Pinte and Yuma Indians eat him with infinite relish. Desert terrapins are often found up to the size of a dinner-plate moving along with dignity and deliberation, but apparently never getting anywhere. Among that particularly hideous trinity, the tarantula, centipede, and scorpion, there is little to choose either in numbers or undesirability. Unless from a very large one, the bite or sting is seldom fatal, though the popular impression is otherwise, as an incident will show. There was at one time a tenderfoot named Willett working a claim in the Calico range of mountains. On his way to work one morning he found a huge tarantula hiding in a crevice. He captured it with a pair of tongs, and killed it, as he thought, with alcohol, intending to keep it as a souvenir. He put it in a light pasteboard box, and, tossing this on a shelf in his little shack, left it. During his absence the creature, extraordinarily tenacious of life, revived sufficiently to push away the light and loosely fitting cover of its prison and escaped. On his return Willett discovered this, and, being unacquainted with the ways of tarantulas, at once concluded that the horrible thing was lurking somewhere in the cabin, waiting an opportunity to leap on him unawares. He nearly tore the shack to pieces in a frantic effort to find and crush his enemy, but without success. After struggling for two days with an ever-growing fear, bred partly of the silence and solitude about him, he set fire to the cabin; and later, his nerve completely shaken, he abandoned the claim. Anything like a complete account of the curious denizens of rocks and sand would take up several more pages: the hydrophobia skunk, whose bite is credibly asserted to produce rabies; the little gray fox, whose reputed nocturnal habits disturb the rest of the imaginative tenderfoot; the kangaroo-rat, a comical beast whose swift progress depends on the skilled use of a stout and muscular tail; and the horned toad, which can defy the attack of any rattlesnake.

Any description of the desert, however inadequate, must include a word about the 'dry rancher.' He is without any exception the most optimistic man in existence. His fortitude and hopefulness under hopeless conditions would make Job look like a cry-baby. He is the man who perennially scratches the surface of the desert flats, and plants seed where, as a storekeeper remarked, 'a man's hair would stop growing without he sat up nights to water it.' From an agricultural point of view he is 'up against it,' as his provisions, his water, even his horse-feed, must be bought and hauled for weary miles from the nearest town; and of all the mysteries the desert holds, not the least is what sort of hope for the future keeps him on his little patch of sun-baked earth or sand.

THE SANITARY ASPECT OF THE MOHAMMEDAN PILGRIMAGE.

AS a possible disseminator of disease, the Mohammedan pilgrimage at all times demands grave attention; especially is this so with regard to the pilgrimage of 1910–11, when cholera was so prevalent in South-Eastern Europe.

The pilgrims are an extremely heterogeneous gathering — Caucasians, Arabs, Syrians, and Indians mingling with Javanese and Mograbins of Morocco. Many are extremely dirty, their garments appear to be family heirlooms, and their personal habits are distinctly open to objection on more scores than one. In most cases the pilgrims are disinfected before boarding the steamers carrying them to Yambo or Jiddah (for Medina or Mecca as the case may be), and on disembarkation there they are again disinfected and undergo medical examination. The journey from the coast by camel to Medina (where Mohammed 'el Raisool' is buried), and thence to Mecca the Holy, is an arduous one, the water-supply being a great source of difficulty. At Mecca itself there is only one well, and grave fears of its drying up were entertained last season.

The conditions prevalent at the height of the season—at the gathering in the valley of Muna and later—when there are over one hundred thousand people in a very confined space, are such as would favour an appallingly rapid spread of any epidemic which caught hold. It must be borne in mind that Europeans are not permitted near the Holy Places of the Yemen if they are not followers of the Prophet, and European medical supervision is therefore conspicuously absent.

After their return to the coast, the 'Hadjis,' as they are termed after making the journey, are conveyed by steamer to Tor in the case of those going north, and those going south to Camaran. Both are quarantine stations in the Red Sea; the former one hundred and twenty-five miles south of Suez, and the latter north of Hodeidah, near Aden. The steamers are subject to special regulations; doctors, hospitals, and attendants must be carried, water-tanks covered up from possibility of contamination, and a certain specified amount of deck-space allowed for each pilgrim as accommodation, and again half that space extra as exercise-ground. In addition, stringently enforced rules regarding the purely sanitary arrangements are in force.

On arrival at the quarantine camp, the pilgrims and ships have to undergo three days' quarantine if the pilgrimage has been declared clean, or either seven or ten days if it be declared *brut de peste*. Those undergoing ten days have no further quarantine to undergo; but those for Morocco and other comparatively distant countries undergo their seven days, and a further three days at their destination. This with regard to Tor, which is under the Egyptian Quarantine Board.

On disembarkation, all food and possibly contaminated luggage—that is, germ-concealing—are destroyed; the remainder is fumigated and returned to the owners when the period of surveillance is over. Each shipload of Hadjis is then placed in a separate camp, and kept from mingling with other lots. At one time over ten thousand pilgrims were in Tor camp, and the staff—consisting of European (including British) doctors, and of British nursing-sisters—had as much work as could possibly be contended with. It is a testimony to the efficiency of the regulations and the way in which they are carried out that only twoscore odd cases of cholera occurred.

The difficulties encountered in dealing with the Hadjis are various and often acute. Many regard the interference of the authorities as altogether unwarranted and an interposition between themselves and Providence, and their numbers render concerted action on their part a force to be contended with. It not infrequently happens that, on account of a mutiny among the fanatics, a shipload of Hadjis has to be sent off before the period of quarantine is up. Their disposition also renders the necessary isolation of relatives or friends a matter requiring diplomacy of no mean order, the ignorant fellahin in particular giving up all hope of seeing again those who are separated from them. For this reason, also, each shipload has to be sent off complete as it arrived at the camp. The Chinese are fractious patients, some of them labouring under the idea that medicine given them is poison to speed the departing, as is the case sometimes in the more benighted parts in their own country. Others, again, murmur 'Kismet;' they are usually old men who have spent most of their lives in gathering the necessary money for the pilgrimage; and if it is the will of Allah that they should depart to the Elysian Fields, why, is it not fate?

Although the work at the camps is hard, there are a few distractions to enliven things, and of course humorous incidents are by no means uncommon. There is, however, a general sigh of relief when the last load of happy Hadjis departs, the passengers certain of their future translation into the Gardens of Bliss where the almond-eyed houris await them, and that while in this world they are certain of veneration and respect.

THE SEA-SHELL.

I HOLD a sea-shell to my ear—
What is this murmur that I hear?
Sound of the far sea's softened din,
Or pulse-beats of my heart within?

And when I feel, the still night through,
Sense of thy presence—ah, is 't true?
Comes thy sweet soul, or can it be
The love my own heart bears to thee?

IF I WERE A MILLIONAIRE.

By Sir ARTHUR QUILLER-COUCH.

'IF I were a millionaire'——

'Was it a publisher who invited you to imagine that?' asked Cynthia. 'If so, the man must want to add insult to injury.'

When Cynthia interrupts me in the throes of composition I sometimes miss the point and answer inattentively. 'I don't see where the insult comes in,' said I. 'A story-teller has at times to imagine himself all sorts of unpleasant characters—a pirate, for instance, or an anarchist. Why not a millionaire as well as any other enemy of society? If I were a millionaire'——

'Ah!' Cynthia drew a long breath, laid down her knitting, and leaned forward with her hands spread to the fire and a soft rapture in her eyes. 'You should put away pen and paper and never trouble to write another book in your life!' she murmured.

'I—I had hoped that one or two masterpieces yet remained to be written,' was my faint protest. She ignored it.

'And you could have that six months in Rome, and the long tour in Greece, with the cruise to the Ionian Islands, and that other cruise up the Nile—all the journeys, in fact, that you have always been planning but could never afford.'

'Alas! no.'

'And that winter in Italy, with all those pictures to see. You have told me often enough, when in a bad temper, lamenting your fate, that Italy was necessary to every Englishman who tried to be an artist, and that, except for the shortest of visits, you had missed it.'

'Alas! yes. But if I am to write no more books it would scarcely seem to matter.'

'And Japan and Quebec — not to mention Seville and Salamanca, and the pilgrimage to Madrid to see Velazquez' "Surrender of Breda." We could contrive them all.'

'Contrive!' I echoed. 'You don't seem to realise your luck. With a million of money we can buy a steam-yacht, and order it to take us whithersoever we list. It would be worth while to contrast it with our old voyages in the little *Vida*, when I cooked breakfast in the cockpit whilst you tidied the cabin—do you remember?'

She smiled at this. As if either of us could ever forget! 'I detest steam,' she answered.

'We would start with a comfortable schooner—a safe, roomy one, with high bulwarks.'

'Already,' said I, 'you begin to evince the creeping cautiousness of affluence. There were no bulwarks on the little *Vida;* and when we were young, and it really mattered if we drowned, a sea on board used to be rather good fun. Anyhow, we might start in your comfortable schooner; assuredly in the time left to us we should never arrive at all the ports we desire to visit.'

'I don't see why you need make us out older than we are,' objected Cynthia, and the rebuke will ever be convincing while she can pout so becomingly.

'You forget,' I replied, 'I have just come into a million of money, and am feeling the strain.'

'Anyhow,' she said, 'we could enlarge the library—as you planned, two years ago.'

'That is true,' I agreed, looking around the narrow workshop in which we sit after dinner, preferring it to the drawing-room. The books stand two-deep on its shelves, and Heaven alone knows how much loss of time and temper this has cost me at one time and another. 'At this moment I am wondering where to dig for my volume of Clough, to turn up the poem that begins:

> How pleasant it is to have money—heigho!
> How pleasant it is to have money!

and resumes the strain (as I seem to recollect) *da capo.* I don't see what else could be done with so absolute a thought.'

'It is the absurdest room for a library,' Cynthia announced with the air of one making a discovery. 'It ought to be at least twice as large again.'

'But if I am to have done with books it scarcely seems necessary'——

'And then,' she pursued, 'we could have a floor above, which would just take that other guest-chamber we have been wanting so long, with a dressing-room, extra bathroom, and perhaps a new heating-cupboard'——

At this point I arose and took the hearth firmly, standing above her with my hands deep in my pockets. 'I must beg you to listen,' said I, 'as one millionaire to another.'

 [*All Rights Reserved.*]

'But I thought it was only one million between us.'

'Don't trifle, please—as one joint owner in a million to another, if you prefer it.' Cynthia murmured that she didn't, but I went on unheeding. 'You don't seem to know what a million of money means. You talk about enlarging this box of a house when a moment's reflection should tell you that people in our position cannot possibly be content with less than a country seat, with the sort of garden you see illustrated in *Country Life*, and at least a couple of thousand acres of rough shooting, not to mention a home-farm, a deer-park, and such trifles.'

'I have always wanted that,' agreed Cynthia sweetly; 'with a house (or at least a flat) in London. But I began with this house because we must have this too; the children think there's no such home in the world.'

'God bless them for that! But how many days in the year are we already leaving them to enjoy it? For I know that, while you can help it, you will never let them out of your care. Well, *imprimis*, we tour the world in a fine schooner yacht, wherein I listen for their footsteps on deck, myself seated in my cabin signing cheques—the most abhorrent occupation in the world. You, meanwhile, are not only engaged in wondering what deterioration our absence will work in our own domestics—and I should say that no living woman had ever been luckier in her servants, if I didn't know that with you it's no luck at all, but just a combination of steady government with steady liking—I repeat you are not only worrying about them, but fretting yourself about servants to be engaged for London: how to engage them, and then how to trust them—untried creatures, exposed (in our frequent absences) to a hundred temptations of which our tried ones know nothing. While our yacht explored—say the South Sea Islands—you would be worrying over servants. On top of that you would want me to stand for Parliament.'

'Women are ambitious,' said Cynthia, musing.

'So are some men in their way. I once had an ambition to write books. But as yet we have faced only the inconvenience of living up to our income. We have still to consider the far more difficult problem of getting rid of the capital before we die.'

'I don't understand you at all,' said Cynthia.

'A racing-stable would bore me to death. When we visited Monte Carlo some years ago, we agreed in disliking the smell around the tables. To distribute the money among the deserving poor would take all the time we have already set aside for foreign travel. Yet something must be done, for the necessity is urgent. You remember the American millionaire we met at Basle? To be precise, it was I who encountered him after his womenfolk had driven me to escape from the compartment in which for forty minutes their talk had been torture. I abandoned you to them; yes, I confess my cowardice. I plunged into the nearest refuge, a second-class smoker, and there I stumbled over the Steel-King. He sat picking at a paper-bag stained with the juices of decayed cherries. They had handed out this refuse to him at the station before last, when he looked in to see "how they were getting on." Having finished his meal of offal, he lit an unsavoury cheap cigar, and asked (for he recognised me) what I thought of his Show—that was the word; and actually I conceived then and there a respect for this man (ostensibly the meanest of human products), and could understand his pride in escorting such a wife and such daughters on the mission of making Europe sit up. I found something great in this showman who could so cheerfully accept the charity of his exhibits and take its orts, with his dignity, off to a second-class smoking-carriage. But I felt no desire to emulate his greatness. My dear,' I exclaimed upon a sudden happy thought, 'I have it! We can make over the bulk of this silly wealth to the Bodleian, retaining enough only to pay our passages handsomely around the world and keep us, on our return, in comfort all the rest of our days.'

'The Bodleian!' said Cynthia. 'Doesn't that already get a copy of every one of your books for nothing? I never could see why.'

'Nor I. But since you condemn me to write no more, I suggest that we owe it some recompense.'

THE CAHUSAC MYSTERY.

CHAPTER XVII.—AT HONOUR'S ALTAR.

MRS WESTAWAY was very grateful. She had never specially liked M. de Sarsan; but if by some ingenious arrangement of the Lanceley money matters he could save disgrace to the family at large, and relieve them of expense in the minor particular of providing for Wilford's debts and maintenance, why, there was every reason to be nice to the man. He had been talking to her for half-an-hour; and, though she could not understand his chain of reasoning, she hoped she had got hold of the main fact.

'I'm sure it is very good of you to take so much trouble on my nephew's behalf,' she was saying. 'We all consider it most clever of you to have saved anything for him. Will he be able to live decently?'

De Sarsan caressed the points of his moustache.

He saw through his hostess's bland civilities, and despised her rather more than he despised most British matrons. But he replied suavely, 'I promise you he will be able to live as he has lived heretofore, with the exercise of a little economy. That is all.'

Mrs Westaway sighed in a manner that betokened relief. 'That is delightful for him, and quite charming of you to be so resourceful,' she said. 'But I still wish that Alice had been less wrong-headed and obstinate.'

'Is it not your family sense of honour? We cannot condemn her,' De Sarsan rejoined innocently; but he had the pleasure of seeing Mrs Westaway colour and wince.

'Slightly exaggerated in her case,' corrected the lady.

'Exaggeration is the fault of youth. We all enthuse while we are young,' he said tolerantly.

'It is unfortunate that enthusiasm so rarely provides for its disciples.'

De Sarsan was silent for a long moment. It was an eloquent silence, and Mrs Westaway actually squirmed in secret under its reprobation. She felt mean.

'We must mark our sense of her folly,' she said, as if in reply to an accusation. 'She opposed those who were in a position to judge better than herself. You may call her conduct by any euphemism you please, but the fact remains that she chose to play the heroine at other people's cost.'

It was some days after the reception at Lord Fulham's, and De Sarsan had had time since his return from Paris to put Wilford's affairs in order. This proved to be a somewhat expensive matter; but Alice's fortune, which was in his hands, more than repaid the outlay. Moreover, he felt he might without much risk undertake to finance that young man in the future, for Puyfot's verdict on his health had been conclusive. 'His grave is already dug; he may tumble into it to-day or to-morrow—who can tell?—but probably before the year is out.' De Sarsan had come to Park Lane to-day to learn Miss Lanceley's exact position under the altered aspect of her fortunes.

'I will not ask any indiscreet questions as to what you have decided upon with regard to her future; but I must deal with frankness as regards my own relation to it,' he began with a new earnestness of manner. 'I have a very sincere feeling of friendship for your nephew, Mrs Westaway; but I am not so entirely disinterested as you seem to suppose. I have long admired Miss Lanceley; will you pardon my saying that I now admire her more than ever? I am somewhat older than she is, and I have hesitated to express my wishes; but, since she is helpless and practically alone in the world, it is the moment to try my fate.'

Mrs Westaway's blonde and pretty countenance took on a deeper tinge. All her insular and class prejudices rose against the Belgian who aspired to ally himself so closely with her family. On the other hand, there was Alice's position. It might be quite as well for her to marry De Sarsan as to become a governess or something dreadful of that kind. He read her thoughts easily in her changing expression.

'I conclude that my niece knows nothing of your feelings?'

'No; and I venture to suggest that no step should be taken,' he said meaningly, 'until she has had time to consider my request, and make up her mind as to the answer she will give me. Pray speak to her hopefully of her future; do not allow her to be influenced in her decision by any fears for the uncertainties or difficulties which may lie before her should she choose the destiny to which you and her other relations have—forgive me once more—condemned her. I would have her accept me of her own free will, unbiassed and uninfluenced.'

'As you wish; although I think a girl who has already shown herself so blind to common-sense should be guided.'

De Sarsan smiled, but not agreeably. 'I am ambitious, I fear, madam. I have a desire that my wife should accept me from absolutely any other point of view than that of common-sense.'

This independence established him in Mrs Westaway's respect. She succumbed at once. 'Alice is in the house. Would you like to see her?'

'There is no time more happy than the present for a man in my position,' he replied.

While he waited alone he thought over the coming interview. It must be important in its results, and he had little to guide him in the conduct of it. The side of life with which he was familiar would not aid him on this occasion. Alice, in her innocence and aloofness, stood outside his experiences. These qualities tantalised and allured, but they also perplexed. Whether she really lived in the cool altitude of Puritanism or in the lower kingdom of bread and butter he did not know. He smiled to himself. Alice was docile and young enough to be moulded, and he looked forward to bringing her to his own reasonable level. For the present, however, he must avoid wounding her susceptibilities; he would handle them delicately. Yet the marriage must not be too long delayed; expediency urged haste.

At that moment she came in. She had just returned from walking, a tall, slight figure in gray, with a coil of soft golden hair, and blue eyes shining. The wind outside had ruffled the plumes in her hat, but brought no colour to her cheeks. She looked tired and heavy-hearted. The man's callous feelings grew pitiful at the sight of her.

'Dear mademoiselle, you are fatigued!' he said with concern.

'One always is at this stage of the season,' she answered with a forced smile. 'I know something of it; this is my second season.'

'You were not at the Fetterings' last night?'

'No. My aunt did not feel inclined to go. Who was there?' It was a question of the barest civility, but it led directly to the first point De Sarsan wished to make.

'I did not stay long. As soon as I found you were not likely to come I left.' He watched her as he spoke, and was pleased to see a faint flush light her pallor for a moment. 'I saw Lady Madesson and Mr Cahusac of course.'

She was paler than ever now. 'I have not met either of them for some time.'

'But you have heard? It will be a very good thing for him,' he ended as if by an afterthought.

'What will be a good thing for him?' There was no change in the gentle tone; but De Sarsan was far too experienced an observer not to detect the effort the words cost her.

'For the moment I had forgotten Wil's infatuation,' he said apologetically. 'For him, however, the marriage would be less desirable.'

'Would it be desirable for any one?' she asked coldly.

'Yes, certainly—for Mr Cahusac. Her money will mean a career to him. To marry without it spells ruin for a man in his position. And I fancy he knows it.'

There was a pause. Cahusac's words flashed back upon her with a new meaning: 'Whatever you may hear, whatever may happen, believe in me still a little.' And he had been thinking of this—this hateful marriage!

'After all, we must not blame him. She is a very beautiful woman,' De Sarsan added.

'It saves Wil at least,' she said rather faintly.

'I came to talk to you about Wil. He is very penitent and heart-broken. He has ruined you and himself.'

Her white brow took on an anxious frown. 'I have tried to do right, but everything has gone against us. I try and try to puzzle some way out, but life is such a muddle.'

'Have you thought of your future plans?' He suppressed a smile. He could not imagine Alice taking a practical course of any kind.

'Yes; I must be a governess or companion. But I don't know how Wil will live on small means.'

'I fear he will have to live on no means at all.'

The girl clasped her hands tightly. 'Don't say that! I will give him all I can earn. I shall want nothing for myself.'

A very real tenderness rose in De Sarsan. He shook his head sadly. 'My dear child, you don't know what you are saying. Wil could not live for a week on all that you would earn in a year.'

'Then what am I to do?' She was so crushed that he ventured to take her hand in his own.

'I can see a way out—if—if only you will consent to it,' he said with hesitation.

She raised her tearful eyes.

'I gave Mrs Westaway to understand that I had been able to save some remnant of your fortune for Wil. I cannot deceive you in the same way. There is nothing left—actually nothing. Wil's health is not good; if it were I should not dare to make the proposal I have in my mind. As it is, I—we—have no option. Break off his old habits of life, give him poverty, and he will die.'

'Yes!' A single word, but De Sarsan felt he had touched the very centre of the question, the dread of the girl's life.

'You would not sacrifice your honour for his sake, but would you sacrifice your pride?'

She started. 'My pride!' she repeated breathlessly. She appeared half-afraid to hear him speak again.

'We—you and I—are the only two people in the world who care for him,' he resumed. 'Will you let me provide for him? He shall live on in the old way'—— He ceased; the next point was the scoring one.

She looked at the hand he held; she loathed his touch, yet had not the courage, the coolness, at such a juncture, to draw it away. The man's kindness held her imprisoned. Her brain was in a whirl. On one side the relief was so unexpected; on the other a new tension had been created that held hideous possibilities. De Sarsan, watching her, followed her thoughts fairly well. He was prepared for her next words.

'Of course I consent, for his sake. I can't say anything else. But—I can never thank you'—— she faltered.

De Sarsan put his left hand over the tremulous fingers he held in his right. His face was red, his bold eyes abashed, as he said in a sibilant whisper, 'I am willing to do all one man may do for another for Wilford, but I have dared to hope'——

'Ah!' she breathed, sick at the fulfilment of her fear.

'I have hardly allowed myself to imagine—— Alice, may I hope?' His voice trembled.

'You cannot care for me!' she cried, quivering under his gaze. 'I am only a girl, not witty, not interesting at all, not even clever.'

'Yes, I do love you,' he answered. 'I have adored you always, from the day I saw you first. See, you will make Wil happy, and me also. You are so gentle, so unfit for the rough usage of the world; how could you struggle amongst strangers, alone?'

She shuddered. The thought had been horrible; it had haunted her for weeks. Yet to be with De Sarsan always—to become his

wife! She glanced at him. He was middle-aged, and though carefully dressed as ever, with that extra glossiness of apparel and aspect which is so foreign to the English gentleman, his figure betrayed him. She contrasted him with Malcolm. Her pitiful strait mirrored itself in her face.

De Sarsan dropped her hand, and rose with a telling air of respectful sadness.

'I will not urge you, mademoiselle. I believed that you did not hate me.' He paused.

Her love for Wil and a tragic force of terror with which she regarded the cruel unknown world into which she must otherwise be cast drove her on. A dim thought strayed across her mind at this last moment; it ended her wavering. Malcolm had bidden her good-bye, and De Sarsan unconsciously supplied the reason when he mentioned the rumoured engagement to Lady Madesson. In her desire to do right, Alice realised she had thrown away not only her fortune, but with it, alas! her chance of happiness. What had she left to hope for, to expect? Lorrie Madesson's estimate of her character was not faulty. In that high-strung mood she almost gloried in her martyrdom. De Sarsan, middle-aged, unromantic, incredibly dapper, beeswaxed at all points, with his worn smile and hateful flash of shining teeth, remained her only refuge.

'I will do as you wish,' she said tearfully. 'I promise it. But you will let me go now. I must be alone.'

(To be continued.)

STATE INSURANCE IN GERMANY.

By Richard Thirsk, Author of *Berlin*, &c.

[The subject of State insurance is necessarily a highly controversial one, here even more than in Germany. And this article on German State insurance is given as a contribution by a writer in Germany well qualified to judge of German conditions, and not as committing us to his view of the probable consequences of State insurance in Britain.]

WITH the industrial awakening of Germany began the almost unprecedented migration towards manufacturing centres. The smoke-clouds rising from chemical-retorts and the clang of forge-hammers exercised a magnetic influence on the population. Industry meant better wages and—it was taken for granted—more pleasurable existence. Consequently the call of the factory was irresistible. Success in the war against France filled the nation with an overpowering sense of its importance. In order to impress this upon their fellows, and at the same time to tempt fortune, men ventured upon madcap undertakings as incredible as the South Sea Bubble. Under such circumstances the idea naturally spread throughout the land that the dream of its philosophers was about to be realised; that the new Germany, soaring out of the ruin and devastation of ceaseless warfare, had at last come into its inheritance. Its smelting-furnaces and forges were to amass untold wealth. Hence the guiding of the plough was left to the care of foreigners from Russia and Poland; they were good enough to do menial service, to be hewers of wood and drawers of water, while the natives, in their imagination raised to a higher plane of civilisation, crowded into the towns in search of more refined employment and more glorious life. All preconceived economic notions were to receive a shock. The future belonged wholly to industrialism.

Unfortunately large numbers of those who went forth full of great expectations in search of El Dorado were soon to discover that the struggle for existence in cities is often fiercer than life in the country. Industrial success did not mean for the masses unlimited theatres, concerts, and balls. On the contrary, it meant harder and less congenial toil, in some instances verging on slavery. Nor did the wealth filter down to those who considered they had earned it by their labours. Their enjoyment of it was limited to glimpses of the vulgar show of the suddenly rich. Then dissatisfaction followed disappointment, aggravated by the constant increase in the cost of living. Malcontents sought refuge in Social Democracy, which took up the struggle against those whom it avowed were robbing the working-man. The Government, contemned by most Germans so long as they are prosperous, was bitterly attacked. This venerable institution has always proved ready to appear generous when by doing so it stood to gain rather than to lose. In response to pressure brought to bear upon it, and to silence the mob, it undertook the reform of those social evils arising out of the new conditions of life in towns. It preached with all the vigour of new discovery what economists have taught for generations: that the well-being of the people is the first essential to the prosperity and the strength of a state. Specialists were sent out to study how social problems were solved abroad. Their reports were Germanised to suit German requirements, and, where possible, to swell the Treasury. This was the beginning of the social reform craze which has foisted so many intricate schemes upon the people, some of them good in themselves, others merely vagaries, and all of them demanding the most careful consideration before they can be uprooted and transplanted in other

countries. It is safe to say that under representative government, instead of bureaucratic officialdom, one-half of the so-called reforms would never have been tolerated.

Among the earlier schemes was the State Insurance Act, intended to relieve the distress caused by sickness, accident, and old age among the labouring classes. Though this measure has been sufficiently long in operation to have survived the initial stages, opinions are at variance regarding its merits or demerits. Those who have sought to introduce what is practically the same measure into Britain have lauded it as though it were the panacea for all social evils; while others, probably more intimately acquainted with its administration in Germany, condemn it. The pros and cons may be summed up in a sentence. Officially, State insurance in Germany is a success; popularly, it is a failure. It is a success because it has proved an invaluable source of income; it is a failure because it has tightened the grip of bureaucracy and placed burdens upon all classes of the community without giving them proportionate benefits. It has superseded the friendly societies, whose funds were formerly distributed among members on much more generous terms than the Insurance Act offers. It compels the workman and his master to hand over to the State part of their weekly earnings, irrespective of circumstances or requirements. It is, in short, a coercive measure; and, like most coercive Acts, the good it does is not always proportionate to the evil it causes. While reaping the advantages, the State enjoys a cheap reputation for generosity.

It may frankly be admitted that the insurance system is so complicated, and has so frequently been amended, that even the officials who administer it cannot, without applying to volumes written on the subject, give a clear interpretation of its working. All that the majority of the people for whom it was passed into law know is that they have to pay, and they grumble. Employers of labour grumble still more, maintaining that it is they who have in the end to bear the whole cost of subscription to the fund. According to the Act, masters are forced to contribute what is nominally one-half, deducting the remaining half from the wages paid by them; that is to say, masters and mistresses are not only contributors, but are forced to be the collectors of this State tax. This has led to considerable friction between employer and employed. As wages are paid minus insurance-money, workers cannot be brought to look upon this in any other light than as a reduction of the pay they have earned. This, they contend, is an unwarranted trespass upon their rights. Furthermore, they argue, with justice on their side, that so long as the present upward tendency of prices for household necessities continues wages ought to increase and not decrease. The employer, being at the same time the collector, is usually the culprit on whom the indignation is vented, and remarkable instances of deadlock resulting from disputes are not uncommon. This phase of the subject was brought prominently to the fore by the enforcement of the latest amendment to the Insurance Act, which came into force on the 1st of January of this year, whereby subscriptions have risen as much as 20 per cent. The outcry against this is so general that trouble is anticipated. Even the most docile of German newspapers have joined in the propaganda, echoing the conviction of employers that the increase must lead to an increase of wages. In fact, in many instances the rise has already been granted.

This burden falls heaviest on the proprietors of large undertakings where hundreds of workers are employed. It means an enormous addition to the cost of production, and though this must in the end be borne by the consumers, it nevertheless hampers the producers without offering them any equivalent compensation. It is tantamount to a tax upon production, and its effect is most felt in foreign markets, where Germans must compete against countries which have no such tax. The steady increase of tariffs can only protect the home markets; but this usually means a corresponding effect in the foreign markets of countries which have such a fiscal policy as enables them to retaliate. Hence the numerous deputations from the various Chambers of Commerce, from Masters' Guilds, and other societies representing employers, petitioning the Government to remove this burden from national industries. Government hopes to remove it by inducing Germany's commercial rivals to adopt a similar scheme of State insurance, hampering their manufactures for its maintenance after the fashion of the German model. It is no secret that to this end official propaganda has for many years been systematically conducted in England, America, and France. So far, Britain is the only one of the three that has fallen or seems likely to fall into the snare. America and France, after going to the expense of thoroughly investigating the scheme, definitely refuse to give it further consideration. That British legislators should have sought to transplant it to their country, with all its defects and shortcomings, perplexes no one more than dissatisfied Germans, who would gladly make a present of their scheme if by so doing they could have done with it.

Were the advantages derived from German State insurance in anything like proportion to the disadvantages, those whom it is intended to benefit would have little cause to complain. In cases of illness insured people are limited to the services of such doctors as the Insurance Commissioners may appoint. As the remuneration is small, it goes without saying that the insur-

ance does not attract either the best or most skilful class of medical practitioners. In spite of all that has been done to give these doctors some show of official standing, they continue to be looked upon as the men who have failed in their profession. Doctors showing ability to cultivate a lucrative private practice refuse to have anything to do with insured patients. Apart altogether from the question of fees, they must observe this rule in order to protect themselves, since private patients are shy of insurance doctors. With the medical profession the scheme has never been popular, and though in the course of years the difficulties have been partly solved by the choice for the insurance posts of young doctors working up a practice, or doctors without ambition or ability, the situation is still far from satisfactory. There are numerous intricate and irritating problems to be solved before practitioners can be reconciled to work in harmony with the Insurance Act. Whether this Act is to blame, or other causes have necessitated it, the average German medical man looks upon his profession as a purely money-making business. There is no sentiment about him where there are no fees, and one seldom hears of gratuitous devotion to the suffering poor arising out of a high sense of duty and the love of doing good for its own sake. Unfortunately the medical profession in Germany does not enjoy a particularly high social standing, and has few inducements to offer to the stamp of man who might prove most useful to it.

Insured patients are made to pay the penalty for this friction between officialdom and the doctors. They are looked upon as pauper patients, very often being treated as such. True, they have the right to complain; but when they make use of this right, their only consolation is the trouble and annoyance of attending lengthy official inquiries at inconvenient hours. In anticipation of disputes, nearly one-half of the Act is taken up with clauses and restrictions, making it impossible for any one who feels he is unjustly dealt with to attack it. The Act is a conglomerate of nearly two thousand hard-and-fast paragraphs, in which human feeling is almost entirely ignored. No allowance is made for the whims of the sick. If they dislike the doctor sent to them, they cannot have another from the fund; and if they fail to keep to the letter of instructions they forfeit all claim to receive treatment. Rather than submit to the iron rules and run the risk of being insulted, large numbers of those who are entitled to call him in renounce their claim on the services of the insurance doctor, preferring to consult a private practitioner and pay him his ordinary fees. This example is followed by those who have no confidence in the doctor appointed to their district, and by those who have neither the time nor inclination to waste half the day in the waiting-rooms of doctors who seem to care little whether they see patients or not, and who foster the notion that a long wait impresses upon one the importance of the doctor.

While admitting the importance of consulting specialists when complications arise, the Insurance Commissioners have not made adequate provision for their services. The securing of these is subject to the consent of the district doctor, who in his own estimation may be a better man than the specialist. When such advice is deemed necessary, patients usually find that the safest way to get it is to pay for it out of their own pockets. This also applies to a certain extent where cases must be treated in hospitals. It may be well to explain that German hospitals do not depend upon voluntary subscriptions for their maintenance; they are supported by those treated in them. Patients are divided into three classes according as they can afford to pay, those in the highest class enjoying extra comforts and better attention than the lower classes. Insurance patients are housed in wards set apart for their reception, which for some reason do not correspond to the highest class. Most of them object to being herded together with all sorts of people, requesting to be treated in the less crowded upper-class wards; but they are told that they must first produce the extra money to pay for this, as the State allowance only covers part of the cost. How this phase of the subject is to be treated under the British Insurance Act is left too vague to be understood. The likelihood is that it will lead to a deadlock, ending in the upheaval of our hospital institutions. It cannot be expected that people who have hitherto voluntarily supported these organisations will continue their donations, and at the same time pay the compulsory State insurance-tax. Logically, the latter does away with the necessity for the former. For the State to step into the breach means that the Insurance Act will prove a costly experiment resulting in increased taxation to meet the deficit on the estimated cost.

In Germany insurance against accidents has long since been dismissed as a delusion. It does not come into force until six weeks after the accident has happened; that is to say, if a man has the misfortune to break his leg he is dependent upon his master for maintenance until the expiry of six weeks. Generally speaking, most fractures mend within this period, and the man is able to follow his employment again before he can receive a farthing of benefit. This is what happens in ninety-nine cases out of a hundred. Supposing the hundredth case to be so serious as to last for more than six weeks, it does not seem altogether fair to make the others pay for this. As for the pension granted in cases where accidents cause permanent injuries, the sum is so

paltry as to be scarcely worth mentioning. This official valuation of limbs and sense-organs is an insult. Neither the disablement pension, ranging from two pounds to ten pounds, nor the old-age pension, kept practically within the same limits, is sufficient to keep body and soul together. Neither of them suggests comfort or independence, and recipients are compelled either to work, to fall back upon their families, or to seek relief from the poor fund.

These are some of the features that have made State insurance a bugbear in Germany. The British Insurance Act so closely resembles its German parent that it has not omitted even the shortcomings. Instead of benefiting by German experience and avoiding these pitfalls, many of the paragraphs have merely been translated into unintelligible English. It is difficult to grasp how a measure that has caused so much contention in a bureaucratic country can be a success in the boasted land of freedom; and it is still more difficult to conceive how masters and men can afford to contribute their share. The contributions are in reality a help to our competitors in the industrial race, as the expenses of the Act must be added to the cost of producing manufactures, thereby making it easier for foreigners to cut prices even in British markets. Cut prices mean cut wages and dearer living. Submission to the Act means the surrender of so much individual liberty and submission to official control, with all its warping and irksome influences; it means that all members of the community, besides being handicapped in sundry directions, will be compelled to pay the State for doing indifferently what has hitherto been well done by public subscription.

THE WRATH OF ISHMAEL GOUDIE.

CHAPTER III.—THE GROWING BOY.

ISHMAEL'S sullen reserve had become a habit, and a bad habit is not easily broken. Next morning, when Mrs Goudie went up to the attic to arouse her adopted son and to help him to dress, he received her with a gloomy taciturnity that would have disheartened her but for the recollection of the grief-stricken little form that in the night-watches had sobbed itself to sleep on her breast.

In very truth, during those early days Ishmael's attitude towards life was that of one whose hand was against every man, and who suspected every man's hand of being against him. He accepted Mrs Goudie's unwearied consideration in surly silence, remained coldly impassive when she tried to awaken his interest in the life of the farm, and seemed secretly determined to derive pleasure from nothing. As the slow days passed, the poor woman found the child's dogged apathy hard of endurance—harder even than the open derision of her husband, who extracted a species of coarse satisfaction from the apparent failure of his wife's long-cherished scheme.

'I 'm thinkin' ye 'd better send that ane back whaur he cam' fra, my woman,' he said one day, 'or, I warn ye, ye 'll be for regrettin' that ye ever took him oot o' the poorhouse.'

'Oh, the bairn 's no' that bad! He 's maybe a wee bit thrawn; but if we have patience a wee whilie he 'll come roond. He 's real sensitive, an' a' thing 's strange to him yet, ye ken. But ye mustna let him fret ye, John.'

'Weel, mistress, if ye 're pleased I dinna mind,' Goudie said carelessly, reaching for his pipe. 'But, mind ye, ye mauna blame me if ye find ye 've bitten off mair than ye care to chow.'

Nearly a week had passed, and still the bearing of the child remained as obdurate and repellent as at first. Mrs Goudie was almost in despair. She had a vague recollection of having somewhere read of 'changelings,' and sometimes in these trying days she was driven to think that some malevolent fairy must have exchanged the child of her dreams—the blue-eyed boy, with hair the colour of ripe corn and a ready smile—for this black-a-vised brat who appeared to regard all her efforts on his behalf with dumb hostility.

It was with something of a forlorn hope in her heart that, one afternoon, Mrs Goudie walked down the slope to Pittendrevie, the little red-roofed village that nestled in the hollow by the loch. Her mission was to the general shop, whose owner, Mrs Kellock, usually stocked a few toys.

In this instance the stock had sunk to its lowest. As Mrs Kellock explained, the 'traveller hadna been roond she didna ken when,' so the selection was limited.

After turning over the assortment of mildewed penny and halfpenny toys, Mrs Goudie expended twopence on the one choice item of the collection. It was a little purse of bright-brown leather, with a forget-me-not stamped in gold in one corner. A broad elastic band encircled the middle, and inside were cunning pockets in which to accumulate much wealth.

Slipping the purse into her bag with her other purchases, Mrs Goudie returned to the farm. When she got there she filled its empty pockets with coins—a silver sixpence and sundry pennies that she had rubbed bright with whiting. That done, she asked Ishmael to speak with her in the apartment that was known as the

dining-room—so called, perhaps, because only on the rarest of occasions was food ever eaten there.

Pulling up one of the carefully drawn blinds, she waited for Ishmael, who followed, wearing a hang-dog, defiant aspect as he dragged his feet reluctantly towards what, to his limited experience, threatened to prove a new variety of punishment-chamber.

'Come awa' ben,' Mrs Goudie said encouragingly when his apprehensive face appeared at the door. 'Oh, dinna be so frightened at me, laddie!'

Thus urged, Ishmael advanced a step or two nearer to where she sat by the big centre table, on which rested, under a cumbrous glass vase, the sugar bouquet that, many years before, had decorated her wedding-cake.

'Ishmael, I wanted to speak to ye—just you an' me, our two selves.' Mrs Goudie's heart was beating quickly; outwardly she was more agitated than the child who listened to her. 'Ye see, I'm real sorry ye're no' happy at the farm. For I want ye to be happy; an', oh wee boy! I dinna want ye to do onything to anger the maister or to vex me. I ken fine that, if ye just like, ye could be a real nice, kind wee boy. Oh Ishmael, will ye no' try, just to please me, Ishmael?'

Ishmael stood before her mute. His hands were clenched, his lips compressed, his eyes sullenly downcast. The words that had come right from the depths of her yearning heart appeared to have made no impression on the soul that had been starved for lack of parental love and seared by single-handed conflict with a narrow and callous world. Apparently unmoved by her appeal, Ishmael maintained his mulish silence, and for a moment Mrs Goudie was plunged in despair.

Then she remembered the little purse that, still wrapped in a scrap of whity-brown paper, she held in her hand.

'See,' she said, resolutely choking down the lump that had risen in her throat, 'I bought this purse as a little present to ye, an' because I wanted ye to be happy at the Hainings. An' look what's inside it!' Opening the purse, she showed the gleaming coins. 'That money is for ye, Ishmael. An' if ye're a good boy I'll gi'e ye a penny every Saturday.'

Perhaps under his frigid exterior Ishmael's icy heart had gradually been melting. Probably it only required this tangible token of affection to convince his immature mind that no covert menace lay behind the evidences of good-will by which he was surrounded. For on the instant the stone wall of reserve, behind which Ishmael had entrenched himself, crumbled away; and, though he made no protestation of regard, from that moment his attitude towards his protector entirely changed. He became tractable, docile, even affectionate.

Mrs Goudie's dream came true, and when the first marsh-marigolds bloomed in the damp ground down by the burn, they got wet shoes together gathering a bunch to put in the big brown bowl that stood on the kitchen dresser.

Throughout the long, sweet summer days Ishmael delighted to help in tending the young life of the farm—to feed the fluffy ducklings, the downy chicks; to nurse the woolly lambs. With his new clothes, protected by a cotton pinafore, he trotted so persistently at Mrs Goudie's heels that old Bauldy Stewart the ploughman christened him her shadow. Together they picked the green gooseberries for jam or the red currants for jelly from the bushes in the untidy garden behind the farmyard, or rose at dawn to wander over the dewy meadows gathering mushrooms for ketchup.

Sometimes, when there was a lull in the work at the farm, Mrs Goudie would pack a basket with a bottle of milk and well-buttered scones, and, hand-in-hand, the two would trudge the long two miles that lay between the Hainings and the Firth to spend the day on the shore.

One cloud only darkened Ishmael's life—his dislike of the farmer. Now that the boy's limbs had rounded and his cheeks showed colour, and his abundant black hair was no longer clipped to the skin, he was a personable—even a good-looking—child, though after a dark, sombre fashion. And though John Goudie still flung a coarse gibe at him, he never treated him with actual unkindness. Still, for some inexplicable reason, the boy dreaded him from the first, and shrank from his rough pleasantries as though he had been offered physical violence.

On one point the will of the child was curiously fixed. For various appreciable reasons Mrs Goudie objected to the name of Ishmael. After much consideration she decided to name her adopted son after her father, for whose memory she cherished a sincere respect.

When Ishmael was told that in future he was to be called Walter he made no comment whatever; but, to the amazement of his benefactress, he resolutely declined to answer to the name.

'Walter, come here an' see what I've got for ye,' she would say. 'Here, Walter, my mannie, come an' get this fine poke o' sweeties.' But no amount of coaxing or wheedling prevailed. Ishmael, standing not ten yards distant, would remain obstinately silent and immovable, resolutely deaf to the voice of enticement. So, after many futile efforts, Mrs Goudie was obliged to revert to the use of his original name; though she did so with an uneasy feeling that there were depths she had not yet fathomed in the nature of the child who, in the face of changed circumstances, clung desperately to the possession of his parcel of pauper raiment and to the name of an outcast that had been bestowed on him by his dying outcast mother.

As the village school was half a mile distant from the farm, during Ishmael's first winter at the Hainings Mrs Goudie taught him herself. And though Ishmael was not a specially apt pupil, and his instructress's system of teaching was the cumbrous method of thirty years earlier, the hours that they spent in the parlour, when she knitted a stocking while Ishmael laboriously formed pot-hooks or slowly spelt out words of three letters, ranked amongst the most serenely happy of Elizabeth Goudie's existence.

For several years things moved placidly on. Ishmael was a boy of ten, attending the Pittendrevie school, when matters changed.

For a time Mrs Goudie had been ailing, feeling languid, easily fatigued, not her old robust self; when suddenly an air of satisfaction, of pleasant anticipation, pervaded the farm. Mrs Goudie assumed the bearing of an interesting invalid. Matronly friends arrived in dogcarts to take tea and hold long and intimate conferences, from which Ishmael was excluded.

The farmer moved with an added sense of importance. His speech became waggishly figurative. He rarely encountered Ishmael without indulging in raillery whose tenor the boy quite failed to comprehend.

Once, when he was 'market-merry,' Goudie remarked jocosely, 'Ay, an' how'll ye like to have yer e'e put out, my mannie? Ye'll no' be likin' that, I'm thinkin', my bonny man.'

The enigmatic saying gave the boy a vague sense of uneasiness. The farm-servants, who had been within hearing, had laughed at the pleasantry. And Ishmael experienced a sense of brooding discomfiture, and an increase of the repulsion that his childish mind had early conceived against the man whose bread he ate.

Mrs Goudie was kinder to her adopted son than ever, yet it puzzled him to see her fall into reveries in which her thoughts must have been pleasant ones, for when she again awoke to the common interests of life it was with shining eyes and smile-curved lips. And though she sewed constantly, Ishmael secretly wondered why the garments she made were no longer calculated to fit himself.

Then came a day when he awoke to find an unusual bustle prevailing in the house. Mrs Goudie was not well. One of the lads had been sent hot-foot to Braeside to summon Dr Mickle, and old Jean Girney, hastily fetched from the village, had suddenly assumed a position of importance in the household.

Ishmael adored his foster-mother. The idea that she was ill disquieted him. He had been warned not to disturb her, and, feeling miserable and apprehensive, he knew not of what, he was sitting forlornly on the stair outside her bedroom when Jean opened the door and beckoned him in.

Mrs Goudie was resting in the big four-post bed. The expression of uneasiness on her flushed face turned to a smile as she saw the wistful anxiety of Ishmael's look. Raising herself up a little, she put her arms around him and whispered that he must be a good laddie and pay attention to his master, and that if he took a piece to the school with him, she'd be all right when he came home in the afternoon. Then, before he had time to say anything of what he felt—words never came easily to Ishmael—Jean Girney had packed him off in a summary fashion that left him with an ignominious sense of eviction.

CHAPTER IV.—THE SUPPLANTER.

ISHMAEL had eaten his scone and cheese at lunch-time with his eyes fixed on the farmhouse that topped the long slope of the brae to the east, but he kept his promise of not going home. When the afternoon hours had droned by and the longed-for moment of freedom came, he snatched up his bag and cap and ran headlong out of the school-gates, to find Bauldy Stewart the Highland ploughman and his collie-dog waiting for him.

'Ay, my lad, an' it's you,' the old man said. 'Ye'll no' be for goin' home the noo, but ye'll just be for comin' to my hoose to have a bite o' supper wi' me an' the wife.'

'I canna come the nicht. I want to see how my mother is. She wasna weel this mornin'. Dinna keep a grip o' me, Bauldy,' Ishmael protested impatiently, wriggling eel-like in Stewart's detaining grasp.

'Listen to me a meenit, laddie. What's aal yer hurry whatever? It was the mistress hersel' that said ye was to come. An' she'll be doin' brawly. Ou ay, fine an' brawly.'

So, instead of hastening home, Ishmael accompanied Bauldy to the little cottar-house, down by the 'laigh field,' where the ploughman and his wife lived. He had always enjoyed going to tea there. Agnes Stewart baked better dropped scones than anybody in the parish, and to-night there was a special meal in honour of his expected visit—a regular supper, with a stewed rabbit and a big three-legged pot of mashed potatoes.

After supper had been cleared away, Ishmael, in deference to the old folks' special request, read out the stories in his lesson-book, a recital that was received with flattering expressions of admiration for his learning. When Ishmael wearied of his task, and would fain have gone home, his host and hostess offered plausible, but to his mind vexatious, pretexts for delaying him. And it had grown quite dark, and he was sleeping with his head sunk on the table, when Stewart, who had slipped out, returned, and, wakening his guest, led him through the starlit night towards the farmhouse.

'It's yersel' that'll be gettin' the great sur-

prise,' the old man said. 'There 'll maybe be somebody that ye 'll no' be expectin' up-bye.'

'Is it auld Jean Girney? I saw her this mornin',' the boy answered with drowsy indifference.

'No, no, laddie. It wouldna be auld Jean. No, nor nobody like her, I 'm thinkin'. But the mistress 'll be for tellin' ye hersel'.'

Ishmael had never been out so late before, and the strangeness of it all—the silence, the immensity of starlit sky—gave him a weird sense of adventure.

When they approached the house, Ishmael was surprised to notice that the windows were brightly lighted, and as they passed through the stable-yard towards the back-door he saw that Kirsten, the sturdy servant-lass, was standing on the step evidently watching for their arrival.

'Come awa'; we 're wearyin' for ye,' she said in a loud whisper. 'The mistress is speirin' for Ishmael. She winna gang to sleep till she sees him.—Tak' aff thae muckle boots, laddie, an' creep like a mousie up the stair, an' chap rale canny-like at the bedroom-door, an' Jean Girney 'll let ye in. ' But ye 're no' to bide a meenit, mind ye.'

Moving as delicately as possible on his stockinged feet, Ishmael mounted the stair, wondering as he went why he had never before realised what a noise he made. Outside the closed door of the best bedroom he paused, his heart thumping uncomfortably; then, summoning up his courage, he knocked very softly—in a whisper, as it were.

When Jean opened the door he had a glimpse of an interior rendered unfamiliar by the fire that flickered in the hobbed grate and the tall candles that burnt in the old brass candlesticks.

'Is that my big laddie?' a voice murmured faintly from the bed; and, turning, he saw on the pillows the face of his foster-mother, pale but triumphant, the face of a victor after a hard-fought battle.

'Come here, my dearie.'

Ishmael went over and stood by the bed. He wanted to say he was glad she was better, but some indefinable change in her held him dumb.

'See, dearie—see what I 've got to show ye.' With a weak hand Mrs Goudie turned back a corner of the coverlet and revealed the face of a sleeping babe.

'He 's yer ain wee brother, Ishmael. Isna he a bonny wee bairn? Ye 'll—like him, will ye no'?'

Ishmael stood silent, looking down at the tiny wrinkled face. A tumult of emotions—feelings he could not analyse—surged in his breast.

Under his intent gaze the slumber of the unconscious infant seemed disturbed, the face twisted, the mouth opened in a feeble cry.

'Hoosh! awa' doon the stair wi' ye,' Jean Girney said, bustling up, 'an' no' bother yer mither, for she 's sair needin' a rest.'

So Ishmael went downstairs, his puzzled young brain wondering why everybody had taken to speaking so obscurely.

In the dining-room the master of the house was receiving the congratulations of two cronies, and through the half-open door came the mingled odours of whisky and tobacco and the sound of hilarious voices.

Ishmael, who always tried to avoid an encounter with the farmer, would fain have slipped by unnoticed.

But Goudie caught sight of him as he slunk past the door. 'Hi, Ishmael! come awa' ben an' gi'e us yer crack,' he cried boisterously. 'Have ye seen what the guidwife 's got up the stair? Yon 's something like a laddie, I 'm thinkin'.'

'Ay, a grand laddie!' agreed Cope, who farmed the adjoining land.

'There 's no' a finer in the hale o' the East Neuk,' Mactaggart the innkeeper chimed in, speaking with an air of firm conviction that was gratifying to the proud father.

The three pairs of eyes were focussed on Ishmael, who in turn stared blankly at the table, where a big decanter of whisky jostled the time-honoured bridecake-bouquet. A cut-glass rummer full of the pungent, steaming liquid stood at each man's elbow.

'Ay, freends, this young cock 'll no' craw near sae croose noo, I 'm thinkin',' the farmer said with heavy jocularity.

'Ay, man, Ishmael, yer e'e 's put oot noo, my birkie,' added Cope, a bull-necked man with a soft voice and an ingratiating manner. 'The guidwife 'll no' be makin' sic a wark wi' ye when she 's got a braw wean o' her ain.'

'Here, mannie!' cried the innkeeper, shoving a rummer of steaming toddy into Ishmael's hand. 'Tak' that an' drink the health o' yer young maister.—Come on, mates, a'thegither: "Here 's to young Goudie o' the Hainings. Lang may he live an' sing."'

For a long instant Ishmael stood speechless, gazing fascinated at the drink-flushed, jeering faces of the men who were taunting him. Then, as the three rose unsteadily to their feet, and raised their glasses to drink to the health of one whom they seemed determined to regard as his successful rival, a sudden fury dominated the boy, and, dropping his glass and its contents on the ground, he stumbled blindly from the room.

Under the shelving roof of his attic room he lay huddled up on the bed, his hands pressed close over his ears to shut out the ironical laughter that had followed his headlong flight. A long-forgotten depth of misery seemed again to engulf him. Never since his poorhouse days had he known the fierce, helpless rage, the sense

of consuming, impotent wrath, that now obsessed him. A burning jealousy tortured his soul, a furious unreasoning hatred of the unconscious babe that lay close to the bosom of his sleeping mother in the room beneath. Once *he* had been her dear laddie, her bonny bairn. Now and henceforward he would be nothing. The new son of the house had come to usurp the place that had been promised him, had come to be a master to him. Mactaggart had said it.

Then gentler thoughts came to him, the recollection of Mrs Goudie's anxiety to see him, of her tender words, and of the helpless little babe that she had called his brother; and under their soothing influence his spirit gradually quieted down, and he fell asleep.

When Mrs Goudie was up and about again matters at the Hainings showed the conciliatory power of a wise and kindly woman. She tried in every way to prove to Ishmael that her affection for him was unchanged, and she succeeded in awakening and nurturing his love for the little interloper. It was only when the farmer cast a coarse jeer at Ishmael, or when one of his boon-companions twitted the boy on the subordinate position he now occupied in the house, that the lurking sense of antagonism sprang up afresh.

The years slipped on. Ishmael lost his childish good looks and developed into a tall, slackly built lad, taciturn of manner and reserved of speech. His one passion was a dog-like devotion to his benefactress—a chivalrous adoration that detained him at the Hainings, filling a position little better than that of a ploughman, when substantial wages and a situation of trust awaited him elsewhere.

And young Walter Goudie grew apace, from a plump, fair infant becoming a chubby, rosy-cheeked boy; from a boy springing into a sturdy, handsome lad.

When the child of her old age was in his early teens Mrs Goudie's health began to decline. She had always been a robust woman, and for a time Goudie was disposed to make light of her illness. At length Ishmael, acting entirely on his own responsibility, went for Dr Mickle. The doctor's report was so grave that John Goudie, who had been a worse than indifferent spouse, began at once to make well-intentioned efforts to make up for past neglect. But no amount of tardy solicitude can aid a mortal illness; and during four weary months the invalid gradually lost strength.

One night Ishmael was sitting up with her alone. For two days she had lain almost speechless; but just in the darkest hour before dawn she broke the silence of hours, and spoke almost in the tongue of prophecy, telling Ishmael that strange times were coming to the Hainings, and asking him to promise not to desert the farm when she was gone.

'Ye have nae cause to love John Goudie, weel I ken that, Ishmael; but he didna grudge ye bread when ye were ower young to earn yer ain, an' maybe ye owe him something for that. An', oh Ishmael! there's my Wattie; dinna leave him, laddie. Ye ken what John Goudie is, an' I'm feared—sair feared—that ill may happen to Wattie when I'm no' here, for he's real fond o' company, an' easy led. But if ye were to stop here I'd ken that things were a' richt. They aye say we dinna heed onything that gangs on at hame after we're dead; but I think I'd be happier whaur I'm gaun if I kent there was somebody lookin' after things doon here.'

It was the first time that the loyal wife had ever allowed a word of disparagement regarding her husband to cross her lips.

Ishmael gave her the pledge she desired. Then no word was spoken until the dying woman said suddenly, 'I'm awfu' hungry.'

'What'll I bring ye? There's milk an' soda-water, or a wee thing chicken-jelly.'

'No, no, a scone an' butter—or maybe a bit shortbread. Yes, bring me some shortbread, Ishmael. Ye'll find it in a tin in the dining-room press.'

But when Ishmael returned with the shortbread, which he had brought with grave doubts as to the wisdom of the proceeding, for Mrs Goudie had taken nothing but liquid nourishment for many days, the sick craving had gone, and she feebly motioned the rich food away.

Then she signed to Ishmael to lay his toil-hardened hand on hers, that had grown so pitifully white and delicate through forced inaction.

'I think I could rest now. I'm real comfortable,' she murmured with a long, quivering sigh of relief. 'It'll be mornin' soon.'

As he sat thus, while the night-light flickered out and the pale dawn stole in at the edges of the lowered blinds, Ishmael's thoughts were full of the many things he wished to say to her who had been more than a mother to him. Eloquent, living words that his natural reticence had kept locked in his heart rushed to his lips, and he waited for the closed eyelids to part that he might unburden his mind and tell her how deeply he loved her.

But Elizabeth Goudie's eyes never opened in this world again, and Ishmael's words of affection remained unspoken.

(To be continued.)

THE GRAIN TOXICANTS.

IT is upon its grain-supply that the health and stamina of a nation in great part depend. The quality of grain may be rich or poor as regards its nutritive value; but, besides this, recent investigations have shown that in the selection of grain another factor has also to be considered—it must be ascertained whether the grain is free from certain toxins or poisons which are capable of giving rise to disease among the consumers.

It has for many years been known that certain fungoid diseases to which rye is subject generate toxins therein, which, when used in the manufacture of bread, give rise to a disease known as ergotism among those who consume it over a long period of time. A peculiar chronic constriction of the arterioles of the limbs, especially of the fingers and toes, is brought about, and this eventually leads to gangrene and to loss of the affected digits. This curious complaint, though at one time by no means uncommon, is now, since the improvement of processes in the preparation of rye, practically unknown, though cases occasionally come under the notice of medical men. Some centuries ago, however, great epidemics of ergotism prevailed, especially among the poorer classes, whose diet mainly consisted of rye-bread of inferior quality.

There are two diseases largely met with in the tropics, and also in some subtropical and European countries, which have been held also to be brought about by toxins which occur in grains. These are beri-beri and pellagra. Beri-beri is thought to be produced by toxins which are present in rice, while pellagra has been attributed to toxins generated in maize. Great interest has lately been displayed in these two remarkable diseases, and at the present time several expeditions are actively investigating their causation.

Beri-beri has for many centuries been known in the East, reference being found to it as far back in Chinese literature as the second century; while it has been surmised that the disease from which the Roman soldiery suffered while serving in Arabia in 24 B.C. was beri-beri. It was not, however, until the latter half of the nineteenth century that any exact study of this disease was made, the first investigations being carried out in Brazil and in Japan.

Beri-beri is a disease evidencing itself as a multiple neuritis, and it is endemic in many parts of the tropics. The malady is a particularly fatal one, death being very suddenly brought about in most cases by paralysis of the heart. It is common throughout Japan, the Malay States, and Brazil, and occurs in many other parts of the world, the chief centres being the coasts of Africa, Hong-kong, Central America, districts of India, and the West and East India Islands. In epidemic form it occurs in asylums and jails, and has even appeared in Great Britain, notably during 1894 and the following five years, when five hundred and forty-seven cases were reported from an asylum in Dublin.

The symptoms of beri-beri are peculiar. The patient is first attacked with weakness of the legs, and experiences considerable difficulty in walking, often having to be helped along, and moving with a characteristic gait so that the toes are dragged along on the ground. The disease progresses in various ways. In some cases the patient becomes rapidly paralysed, and the limbs waste away until hardly any flesh remains, and in this condition the sufferer may linger for months or even years. In other cases, however, the victim becomes markedly dropsical, the body swells to enormous proportions, there is severe palpitation and terrible cardiac pain, and the sufferer is finally freed from his agonies by death. The former of these conditions is known as 'dry' beri-beri, and the latter has been termed 'wet' beri-beri.

A great number of theories have been advanced to account for the strange symptoms of beri-beri. The disease has been at various times attributed to infected fish, to oxalate and arsenical poisoning, to various germs, and even to exhalations occurring in the air. Dr Braddon suggested that the symptoms might be brought about by an organism which flourished on mouldy rice; and, in order to test this hypothesis, a number of experiments were carried out, all of which tended to show that in some way not definitely understood rice was the cause of beri-beri. A very complete series of observations in connection with rice-diets has recently been conducted in the Malay States, and it is now almost established that the disease is caused by toxins which normally occur in certain parts of the rice-grain.

To enter into details of the voluminous researches undertaken would occupy too great space, so I shall merely draw attention to the more important facts which have been elicited.

A number of experiments were made by feeding fowls on various kinds of prepared rice, and in some cases a disease called *polyneuritis gallinarum* was produced, which is identical with the beri-beri of man. It was found that fowls which had been fed on rice which, by the process known as 'milling,' had had the outer husk removed contracted *polyneuritis;* while if the birds were fed on the milled rice mixed with the outer husks or 'polishings' which had been removed, the disease did not manifest itself. Again, parboiled rice, in which the husk is retained whole, never produced symptoms of *polyneuritis.* From these and other similar observations it was assumed that there exists in the inner part of the rice-grain a toxin which is able to give rise

to beri-beri; while in the pericarp, or outer husk, there exists a chemical principle which is able to counteract the toxic effects produced by the inner part of the seed. From this it is supposed that if milled or husked rice is used as a diet beri-beri results; whereas if the rice is untouched or the husks are mixed in suitable proportion with the milled or cleaned rice, no evil effects are produced. Rice cleaned by primitive methods of pounding is found to be innocuous, since the outer layers are not entirely removed, as by milling. These remarkable discoveries in connection with rice as a cause of disease have opened up a wide field of fresh research, and it is quite possible that similar discoveries may be made with other kinds of grain.

Pellagra has been thought, like beri-beri and ergotism, to be a grain toxicant, possibly induced by the use of unsound maize. Pellagra was first reported in Europe from Spain as an endemic disease in 1735, and from there apparently spread over the south of France and the north of Italy. In Africa at the present time immense areas are infected, particularly Egypt, Zululand, and Basutoland. In India, in Mexico, and in some parts of the United States the disease is alarmingly on the increase.

Pellagra produces a peculiar rash on the face, chest, and arms of its victim; but the complaint is one which is of long duration, and once established is practically always fatal after months or years of suffering. The initial stage passed, paralysis sets in, insanity may manifest itself, the unhappy victim becomes emaciated and covered with sores, and is finally released by death.

Pellagra accounts for many thousands of lives throughout the world, and its ravages are seen not only in tropical lands, but even in countries as near home as France, Italy, Spain, and Roumania. Owing to its incidence in countries where the staple article of diet is maize, it has been held to be due to certain toxins which are produced in the maize by micro-organisms infecting the grain, which are themselves innocuous. Lombroso, afterwards so famous as a criminologist, first made a name for himself by his arguments to prove that pellagra was due to eating unwholesome maize. But the disease is common where—as in France—maize forms no part of the usual food of the sufferers; and since 1905 Sambon's view that pellagra is a protozoan disease, communicated probably by sand-flies, has found increasing acceptance.

THE AMERICAN SECRET SERVICE.

By Day Allen Willey.

WHEN the President of the United States gives an official reception it is something like a Court function in Great Britain, where His Majesty receives the greeting of his nobility, the diplomats from foreign countries, and men and women noted in art, science, and other professions. One sees the same class of guests at the American White House. The army and diplomatic circle must wear the uniforms of their rank, but the thousand others are attired in the 'full dress' common to the people of the United States. When a man is in full dress nothing in his appearance distinguishes him from another, and the ordinary visitor moving in the throng cannot tell who or what his neighbour may be there for.

There is much freedom about these receptions apparently, but the President is not unguarded. As he stands at the head of the receiving line with the 'Lady of the White House,' he is opposite a so-called guard of military officers resplendent in their glittering uniform; but they are there only to add to the pomp of the occasion. Behind them, and at the back of the President, may be men in evening-dress not so immaculate or so well-fitting as that of the guests, and they are usually clean-shaven. As the visitors, one by one, step up to 'The Presence,' these watchful men glance from face to face and carefully scan the appearance of the guests' clothing. If the back-pocket of a coat bulges suspiciously the wearer's shoulder may be touched, and as he turns he is beckoned out of line—and he always goes. A pistol in that pocket means that he is a prisoner. Then the uniformed policemen at the White House take the place of the men in evening-dress, who resume their study elsewhere. Some of the men are looking over the shoulders of the ushers who stand at each entrance.

In the Blue Room, to which the people pass after greeting the hosts, some of the supposed guests linger beside the doors, others stand against the walls, and every one is searching, searching amid the gay throng, his eyes going from face to face to note any one who might be an unbidden guest. These receptions include all members of Congress and many residents of Washington. There is nothing on the entrance-ticket but the name of the person who first received it. He may have given it to some one else. Sometimes it is lost. So men and women may get into the White House who are dangerous—anarchists and 'cranks,' as the Americans say. That is why every one is looked at by these keen-eyed observers.

Such is one duty of the Government detectives of the United States officially called the Secret Service. Their headquarters are naturally at Washington; but no one except a few officials

knows where they are at any time, for the men about the President form but a little group compared with the full force. At Washington there are a couple of rooms in the Treasury Building, with 'Secret Service Division' emblazoned over the door, set aside for the service. In one of these sits Chief John E. Wilkie and his assistant, W. H. Moran; the other is occupied by a dozen clerks. The doors are always open, and any casual stranger may wander at leisure through them. Other than the fact that the man in charge of these offices and the chief and his assistant at Washington belong to it, there is no knowledge as to who are the men in the Secret Service.

Here is one mystery: nobody knows who are the men who actually carry on the work. The Blue Book of the Government departments does not contain their names, and members of Congress have placed none of their constituents on the list. The men themselves, scattered from Maine to California, never mention the fact that they are in the Secret Service, and they are often changed from one place to another. The number of men in the service is known only to those who are directly in charge of it. There are probably four or five to each office, or perhaps a force of not more than two hundred men altogether.

The Secret Service is utilised to investigate the case of any employé of the United States who may be charged with crime, such as theft or anything that would unfit him for the position. Men who board ships and collect Customs duties may be tempted to take bribes from passengers, or goods that pay duty by weight may be passed through the Custom-Houses as being of a lighter weight than they really are because the weighing-scales have been tampered with. Washington, the centre of so many Government departments and bureaus, is another field of work for these mysterious agents of justice, who may never have been seen or heard of by the person they secure evidence against, and he is tried and sentenced on the evidence of an unknown accuser; and when a case is brought to the attention of the Secret Service chief, he selects one of the force who is best qualified to work it up.

The history of the service contains many interesting instances of the achievement of unknown searchers who ferret out criminals. One of the Government bureaus of engraving and printing not long ago suspected that something was wrong in its ink contracts. It was paying forty-five cents a pound for its ink elements, and there was a suspicion that the material was not the best that could be bought. An investigation showed that one individual had the power to place the contract where he chose by giving judgment in favour of a certain ink. A Baltimore ink-factory had long had the contract. The Secret Service men found that the ink expert had been giving the contract to this concern and getting a commission of ten cents a pound, while the company made an enormous profit, for better ink was afterwards contracted for at fifteen cents a pound, one-third of the price previously charged.

In another instance an officer in the American Navy was off on leave and had failed to keep the department posted as to his whereabouts. The Secret Service was asked to find him, and did so, reporting to the department. It happened that this midshipman had committed the irregularity of eloping with somebody's wife in the meantime, and the efforts of the Secret Service were construed as being directed toward making out divorce cases for Government officials. This was the criticism of some enemies of the service; but it found the man, and he became a convict.

After evidence of an offence has been secured and recorded, other officers arrest the man who has been discovered by the service agent and proved guilty; but the final task is to put him through a rigid investigation which is called 'sweating.' For hours he is subjected to questioning. This is on the theory that when a man has committed a crime the knowledge of it is always with him. His mind dwells constantly upon it, and hungers for an opportunity to talk of it. He knows that he has committed the crime, and usually he is aware that the detective knows it. The advantage is all on the part of the detective, and if the man is led the right way he is sure to tell all about it.

A case in point occurred during the exposition in St Louis. An engraver named Crahan was arrested at the race-track for passing counterfeit money. On him were found twenty-nine one hundred dollar bills that were imitations of lawful currency, and a large amount of good money. He explained that he had found the bad money in an envelope, and as a proof of his contention said he had advertised for its owner. This proved to be correct. He said that he had seen no reason why he should not use money out of this envelope in making his race-bets, as he had plenty of his own with which to replace it. He was locked up and his case investigated. A fatal error in the man's story was found in the fact that the advertisement had been inserted two hours before the time he claimed to have found the money. At the end of a week Chief Wilkie took the prisoner in hand. He started by asking the man to keep perfectly quiet until he had finished his talk. Then he outlined the story of the manner in which Crahan had become a counterfeiter. The chief told him that he had been an engraver in Washington, and an artist at his work. He had been studious and intelligent, but above all an artist; and the excellent examples of the engraver's art as shown on the Government money had appealed to him. He had finally traced these designs, and had been interested in developing their perfections. He had printed the money in black, and it had

looked well. He had fallen to wondering how it would look if put into the colours that are used by the Government. He had tried it, and the results had been pleasing to his artistic sense and gratifying to him as a workman. He had wondered if the bills would pass for real money. This would be the test of his workmanship. He had tried to pass them, and their acceptance had proved the merit of his work. He had not started out with the idea of being a counterfeiter, but had drifted into it. As the story advanced the accused man assumed an attitude of acquiescence. The explanation of how he had drifted into crime had never occurred to him, but he in the end told the whole story. Later he used Chief Wilkie's story of his fall as a plea for commutation of his prison sentence, and had it reduced from fifteen years to eight.

The Secret Service never forgets and never stops work on a case that it has once taken up. It is said always to 'get its man' sooner or later. An estimate has been obtained from banking institutions all over the country, and upon it is based the percentage of the amount of counterfeit money in circulation. In paper money it is estimated that there is but one counterfeit for every hundred thousand dollars in currency. In coin it is figured that there are probably three dollars of bad money to every hundred thousand dollars. This is regarded as being as near an approach to an absence of counterfeit money as can be reached. Hunting down the counterfeiter, however, is one of the most important duties of the Secret Service. The bank managers familiar with the various issues of currency used for money are usually the first to detect a suspicious note. If the manager cannot determine who passed it, he posts it to the Secret Service immediately. Here the money is carefully examined with a microscope, and a note made of its defects and its differences from the genuine dollar, five-dollar, or whatever bill it may stand for. Then steps are taken to get the maker. Counterfeiting is mostly done by printers, and often it is necessary to employ the method known as 'roping,' which means learning the facts of a man's manner of life and habits by getting a job, working with him, and forming a personal acquaintance with him.

'Shadows,' as they are called, are like poets —they are born, not made. The 'shadow' must have just those qualifications that make him the least conspicuous man in the street. He must be a man who is absolutely regular and uninteresting, and who would never catch your eye if you met him in the street forty times a day. The man he is shadowing is likely to see him many times, so he must have the ability to appear to be always about his own business and oblivious of his victim. Yet he must have prompt judgment and quick action, and be able to extricate himself from all sorts of difficulties, and not betray himself. Work of all kinds has to be done, and the motto of the Secret Service man is to push it to the earliest possible completion. There was at one time much illegal fencing of Government land for farms in the state of Nebraska, for instance. In order to determine who were the offenders it was necessary to resurvey great tracts of country. Technical men were employed, and these service agents and detectives investigated the illegal routes by resurveying them. As a result many thousands of acres belonging to the Government were found in the possession of private individuals. But the agents also go underground and work as miners or into financial institutions as clerks. All types of men are needed, and whatever emergency is met with, there is just the man for the work. Thus the person suspected often lets out his secret.

As already stated, the man with eyes everywhere is on duty at the White House gatherings; but that is only one place where the 'shadow' performs his part. In the force of the Secret Service a large variety of vocations are represented by those who are to look out for offences against the United States. Political 'pull,' as the American says, can get no one a position. The man must be one upon whom there is no string that could pull him aside from the performance of his duty. The men are picked up here and there whenever one is found with particular capabilities. It is necessary that they have more or less knowledge of law, and they are often recruited from clerks of courts and lawyers. A few, but very few, are graduate detectives from the police force. There are experts in all sorts of trades and qualifications, as many rôles must be played in this true drama of American life.

THE PRIMROSE.

Now since the night of the winter hath passed—
Since, like a dream, it hath vanished at last—
The primrose, that all through the darkness lay
In slumber deep till the dawn of the day,
Awakens and gladly comes into view,
Looking as fresh and as pure as the dew.

Many a flower will ere long appear,
Blossoms enhancing the noon of the year,
Arrayed with tints that are known to be rare,
Or such as the proud and gay choose to wear;
Their bloom excelling, beholders will say,
That which by then shall have faded away.

Yet grace how these will the midsummer-time,
They 'll lack the sweet charm of life in its prime,
And fail to impart so keen a delight
As the joy which Nature feels at the sight
Of the flow'r that, astir on the vernal morn,
Comes in her beauty the earth to adorn.

STEVENSON AND MONTEREY THIRTY YEARS AFTER.

By J. SMEATON CHASE.

THE Far West is not yet much furnished with literary shrines. Far Westerners say that it will be—there has not yet been time for that; which is true. At least a good beginning was made when Stevenson came to sojourn at Monterey, just after the trials of *The Amateur Emigrant* and before the days of *The Silverado Squatters*. It was a true instinct, too, that led him here, for it is the very place for shrines and pilgrims. There is a temperament about the old, straggling town, elusive but explicit, a shadowiness in the sunshine, a faint, desperate air of doubloons and shabby velvet, six inches of sword-point below a vanishing cloak—a something, I know not what, that is in some indefinite way literary and highly Stevensonian.

The few days I passed there were divided among three rôles—pilgrim, fisherman, and student. I desired to compare the old Pacific capital as Stevenson described it with the Monterey of the tourist age; I wished to cast my fly on the Rio Carmelo (surely the pleasantest-named of rivers); and I had an object in studying in its native region the habits of *Pinus radiata*, that 'Monterey pine' which, naturally so restricted in its range, nurserymen have radiated on wider travels.

As I wandered leisurely and solitarily about the winding streets of the lower town, discerning what I could of the Monterey of 1879 and 1880, I found myself soon on the southern outskirts and near the Mission of San Carlos. It was Saturday; and, as I approached, a grave Spanish woman, her handsome gray hair shining through her netted *rebozo*, was gathering from a bush that grew before the convent door armfuls of guelder-roses for to-morrow's altar. Opposite, a group of children played about the yard of the school, calling to one another in musical singsong from time to time, 'Ysabel-í-ta,' 'Pasqual-í-ta,' and once (beautiful enough it sounded to my ears), 'Encarnaci-ón,' with long emphasis and rise of pitch on the detached vowels. They played quietly, and their voices were almost overborne by the clamour of the sparrows that shouted and sparred like newsboys in the great ivy-bushes by the Mission gates.

I entered the courtyard and found myself standing on a pavement of round discs like, and yet unlike, stone, that led up to the church door. They had an odd look, and my curiosity led me to discover later that they were whales' vertebræ set on end in the earth. Monterey has been in its time a whaling station of some fame. While I cogitated this phenomenon a person emerged from a door of the cloisters and walked briskly past me. He was habited in cassock and et ceteras, and was of a serious and conformable countenance; but he had innocently wrecked the gravity of his appearance with a 'derby' or 'bowler' hat. This secular headgear gave him a highly comic air, and I could not refrain from following him with my eyes until he had crossed the road and entered the schoolhouse. He was no doubt the schoolmaster, and I hoped that his scholars might be as artless as himself.

Eastward from the Mission the country opens to a landscape of hill and meadow dotted alike with occasional trees—a very Scottish or English prospect, on which, I thought, Stevenson must often have pondered with the exile's troubled pleasure. I turned away to search for his house, and passing down a street of cottages with gardens bursting with flowers, I came with unexpected suddenness before it. But for a board on its front bearing the words 'R. Stevenson House,' I should have passed it by. What a place! It is the most forlorn, uninhabited, and uninhabitable house in all Monterey; a large, square, flat-roofed box of two stories, with a barn-like door, and windows broken to a quite novel degree. I am sure there were not ten whole panes of glass remaining of the hundred or more whose duty it had been to admit the light while they excluded wind and weather. There is no garden in front, and the sagging wooden sidewalk upon which the doors open threatens the unwary pedestrian with broken ankles. Great patches of plaster have fallen from the outer walls, but an ironical announcement states that the place is 'For Rent' by the Monterey Investment Company.

I tried to fancy in which of the dismal rooms the genial Stevenson might have dwelt, but the imagination found it an impossible exercise. There was not a corner in that dreary, echoing shell to which one could attach a shred of kindly sentiment. If any house in Monterey be haunted, without doubt that is the one.

Crossing the little bridge that carries the road

 [*All Rights Reserved.*]

over a gully with a trickle of water and a thicket of weeds, I turned toward the centre of the town. The names of the streets reflect the mixture of the races: six of the presidents of the United States are commemorated, but there are also Alvarado, and Figueroa, and San Carlos, and other names savouring of Castile and Leon. Velvet-eyed señoritas with complexions of dusky peach mingle with smart tourists from New York, London, and the ends of the earth. On store-fronts appear the names of Arguellos and Duartes, and the legend 'Tamales y Enchiladas' has not lost its appeal. I preferred a small but cleanly restaurant kept by an Italian, where I was served with excellent rissoles and undeniable coffee, while the *padrone* romped genially with the *bambini* in the rear. Issuing, I walked to the water-front, where Japanese fishermen were busy with the sundries of their calling, and others of the same trade but of inscrutable nationality were baptising their nets in boiling vats of some amber liquid. Walking on to the wharf, I passed two Chinese women with hair of that supernatural sleekness which these people achieve by some sleight of Oriental craft. They were accompanied by a boy carrying a baby carmine-cheeked and marvellously becapped, and were animated beyond the wont of their race. As they shuffled past I found myself for a moment enveloped in a torrent of gutturals.

The Custom House—which has seen three régimes, Spain having begun it, Mexico completed and used it, and the United States now operating it (I fear to little profit)—is the Forum or Rialto of the town. Here the ancients of Monterey do congregate, and all day under the wide veranda polyglot conversation eddies amid the smoke of everlasting *cigarritos*. A great ragged cypress feathers out over the building at one end, and I will warrant that if by some more-than-Edisonian magic the sounds and sights that have passed into the subconsciousness of the old tree could be realised and reproduced, it would be a vivid and bizarre draft of history that would be presented. Now the place stands wedged between the railway and the street-car lines; but man himself changes little, he is the great conservative, and I doubt whether the ultimate gist of Monterey's talk to-day would be distinguishable, on an analysis, from that of 1814.

Four miles away over the neck of the peninsula lies the little town of Carmel—for fear of offence I will not call it village. Monterey is old, for the West; but Carmel is of yesterday. It is scattered through the forest, perhaps a hundred houses in all, a modest hotel or two, and a dozen stores. Pines and sand, and the age-long roar of breakers, give the place its setting and character. Scenically, and apart from the handiwork of man, it struck me as curiously un-American; Mediterranean, or English rather, such a place as what is now Bournemouth might have been a thousand years ago. Imagine it thus: a curving bay, shore clasped north and south by long headlands; backing the shore, dunes of sand rather strangely white, and rough sea-herbage growing thereon; beyond that again, the ground still rising, a belt of wood of pines and small live-oaks, with flowering underbrush between; and this verging off into warrantable forest of denser and heavier timber. Towards the southern horn of the crescent the Rio Carmelo comes down from a short course of a score or so of miles, flowing in a pleasant valley of meadow-land decorated, park-like, with slumberous umber oaks. Beside the river where it nears the sea stands the old Mission of Carmel, ripened early into antiquity by less than a century and a half of the fervent California climate.

It was the river and the Mission equally that had attracted me to Carmel, and with rod and lunch I made towards them, taking the longer way by the shore.

Leaving the shore just before reaching the river-mouth, I turned inland. The road ran for half a mile between walls of flowering lavender lupine of a man's height, and so dense as to be hardly penetrable. On the right lay a reedy lagoon, populous with water-fowl, severed from the bay only by a tongue of sand that ran to the river. I could see the white leap of the waves on the bar, like the flash of artillery, as they sprang and clawed incessantly at the barrier.

Half a mile more brought me to the Mission. It stands amid broken ground just above the river, with larger hills rising to a horizon whose tranquil lines are interrupted here and there by timber; a most sightly situation, the embodiment of quiet, an elysium for eremites. A multitude of swallows were weaving all about the place, their sweet trilling voices even adding to the solitude of the wide air, and sunshine, and the cool blowing of the sea-wind. A field of waist-high barley waved close around it, and a group of cattle on the hither side of the fence, already reduced to recumbency, eyed me abstractedly as they chewed and pondered the possibility of eating again. Fifty yards beyond the church was a neat cottage with garden and orchard; and this, being the only house near, I rightly conjectured to be the residence of the caretaker, sacristan, or however his humble ecclesiastical office should be called. An old Mexican was tinkering about the well, and glanced up, but economised his breath in reply to my '*Buenos dias.*' After a moment of doubt I essayed him again with a compliment upon his thrifty orchard, and an inquiry of what kind the trees were, and received my quietus, if I would have had it so, in one word, '*Paihrs!*' which he flung at me with the testiness of an English sexton. But the sight of silver and a coinciding request to be shown the church assuaged him wonderfully, and fetching a large,

fiddle-like key, he accompanied me and threw open the door. To my relief, he remained without, busying himself with weeding the path, and I entered alone.

It is not a large edifice, perhaps a hundred feet long, and one-third as wide. The ceiling is domed, and a choir-loft reached by a much-worn spiral stairway occupies the eastern end of the upper space. At the western end is the altar, of marble, and decorated as usual with candles and artificial flowers. Over the altar are two small windows of stained glass, one representing the Virgin and Child, the other St Joseph. Against them, outside, swallows had built, and the light was all a-flutter with wings.

The seats for worshippers occupied only about a third of the space intended for them, but I fancy they more than suffice for the present congregations of Carmel Mission. A score of cushioned pews, ticketed with the names of Machados and D'Amarols interspersed among others more common to our ears, were supplemented by a few rough benches for our brethren of the commoner clay. Opposite the pulpit, which is niched in the north wall, is a small chapel entered by a doorway of rather handsome design. The remains of an inscription on the wall caught my eye, and I made out a few broken words: 'O Corazon . . . ardes y respl . . . e ilumina el mio . . . Amo Divino . . . angeles . . . alabamos'—— I wondered whether I saw in the ill-shaped lettering a trace of the old Indian neophytes of Carmel, the last survivors of whom Stevenson heard chanting here thirty years ago. '"*In secula seculo-ho-horum*" they went, with a vigorous aspirate to every additional syllable;' and he continues: 'I have never seen faces more vividly lit up with joy than the faces of these Indian singers.' If it be to the purpose, I can add a personal testimony that the faces of our California Indians are not too often nor too easily illuminated from that cause.

Before I left the church my old custodian, reappearing in better humour, exhibited in a little vaulted alcove his treasured store of relics —broken tiling of the original floor, tools supposed to have been used by the native artisans of the building, and two precarious timbers showing traces of rude carving, all that remain of the tie-beams of the roof. There was also a font of alabaster, which, contrary to its appearance, my guide declared to be *muy antiguo*.

I stayed for an hour about the place after he had returned to his cottage, pleased with the humane solitude of the old church, so different from that uncompanionable isolation of mountain, shore, or desert places. I mounted to the campanile, where now a bell hangs only in the largest embrasure; the others have fallen to the vandals. On the top of the cross that surmounts the mossed and lichened cupola a meadow-lark was sitting, bubbling over with the greenness of things. The remains of a few *adobe* houses abut on the road, mere shards of houses, roofless, and inhabited only by a thicket of weeds. In one of them, hardly bigger than a stall, a rotund gray horse was quietly grazing, and ceased for a moment to gaze wisely upon me. I always feel a shock in finding animals thus making free in our abandoned places; it is as though they had somehow outwitted us, and turned us out.

It was late afternoon when I walked homeward along the white winding road. The shining waves of the wild oats went by, broke with a soft whisper at the fence, then fled away and away beyond the low green hill. A covey of quail streamed in Indian file across the road to shelter in the brushwood with timid, crooning cries. Snake-tracks crossed the road, too, evil of omen for the quail. The doves were already flying down to the river. All around was the lonely singing of unseen birds, that familiar companionship of long walks in country places.

As I again passed the Mission, warm and crumbling in the evening sun, the swallows were gone somewhither, but the meadow-lark was still repeating over and over his cheerful canticle. While I lingered, a yellow trap drove past containing a young sombreroed Mexican and a girl of light complexion with a mass of short tawny hair. Her arm was thrown over his shoulder, and they were laughing and chatting in a wholehearted, comradely style that was pleasant to see. There seemed nothing offensive or of ill-breeding in their behaviour, nor in their general manner. Simply, it is California; so, *porqué no?*

My good Mexican must have been to town. He was stabling the old gray horse, and gave me a courteous '*Adios*' as I passed. A wreath of sea-fog crept in, and hung like cold smoke on the summit of the southern hill. The wind blew freshly, and brought more loudly to my ears the grave, inexorable voice of the Pacific.

THE CAHUSAC MYSTERY.

CHAPTER XVIII.—ANOTHER TIME.

LADY MADESSON walked home from the Gardens slowly and soft-footed along the quiet streets to the quiet square where she lived. She was just a little sad, a little glad, more than a little inclined to mock at herself for the feeling of elation which struggled to rise against the warnings of her wiser judgment. She had stirred Cahusac, it was true, more than she had ever stirred him before, crept in behind the shield of his indifference a little farther.

He had paid her an unwonted homage of eyes and brain; but these things could avail her nothing unless they brought her in the end into vital touch with his love.

She was aware that every time she met him he left her with the sense of her beauty more deeply impressed upon him; but he was one of those men to whom there is but one woman in the world, and so far she was not that one. On the other hand, he was beginning to desire her companionship; she could work upon him through his moods, make him gayer or sadder as she pleased, and that was a step. Hope allured her, although she was too clear-sighted to allow it to deceive her. As she grew to understand Cahusac better she realised that she could not judge him by the standard of the ordinary man. His temperament, no less than his life, had set him outside the common run.

When she arrived at home she countermanded her carriage, and resolved to spend the evening in facing the situation which hourly engrossed her more. Never had life been so interesting. She dwelt upon Cahusac, his words and looks, and that swift encounter of glances which had, she knew, been as involuntary on his side as on hers. Yet one good remained. Nevermore could they be ignorant of that which lay beneath the ordinary aspect each faced the world with. She no longer blinded herself as to the nature of her feelings toward him. Their chance meeting in the Gardens set the seal upon all that had gone before. She smiled rather bitterly at herself upon this conclusion. For the third time in her life she undertook loving service; but her attitude toward Cahusac placed this last self-consecration on an entirely different plane, a higher, and for the time a more impersonal, one.

She cast about in her mind what she must do for him. That was simple enough in theory: help him to refute the calumnies that had been spread against him. But in practice it looked far more difficult. If she could mark down his enemy release must follow; he would be free, and — who knows? — happy. How this issue might affect his relations with herself had no part in her thoughts at that time.

Her chief difficulty lay in the fact that she knew so little of his story; she could only guess at what had taken place in Park Lane, and she despaired of winning any confidence on that point from Cahusac. No; she must trust to herself to discover the originator of the newspaper paragraphs. Cahusac's visit to Paris had ended in failure, that was plain; but then things impossible to a man come easy to a woman.

In the first place, she would be forced to renew her acquaintance with Wilford. She shrank from this, but it seemed the straightest road to the object she had in view, since Wilford had been De Sarsan's companion in Paris. She still held strongly to her first opinion that De Sarsan was the man who pulled the wires, if only they could prove the fact of his complicity.

Wilford came at her summons, aglow with expectation. He had never ceased to believe that Lorrie must prefer him. He believed also in his power to fulfil any promise he might make her. If she were beside him to help him, all would then be well.

Her rooms were full when he arrived, which gave him a shock of disappointment. He had deluded himself into the fancy that she was as eager for a meeting as himself.

'I am glad to see you,' she smiled in passing.

'Thanks,' he replied sullenly with a significant glance round the room.

'Cross?' Her eyes bewildered him. 'They will all be gone presently.'

'You do mean it?' he whispered anxiously. 'Good Lord, Lorrie, the sight of all these people made me sick!'

She shook her head warningly and left him, but he was more than content to wait and savour the bliss that was coming.

He was in the inner drawing-room alone, staring abstractedly at his finger-nails, when she stood suddenly before him. Wilford did not admire charming simplicity; he liked women when armed at all points for conquest with every art that civilisation can furnish. One of Lady Madesson's strongest claims upon his heart was her masterly manipulation of clothes. The fabrics she preferred were soft and rich, and the fashion of them a dream. She comprehended the bewitchment that lies in lace and filmy accessories. The art which seems to hide and yet reveals was not unknown to her, but she used it delicately, with a subtle and sure effect. The results were never obvious; the gratified eye took her in as a whole, radiant, indescribable.

'Is it not time for you to go away?' she asked softly. 'Every one else has gone.'

Wilford was smiling fatuously. 'I have always said, Lorrie, that you were the only woman in London who knew how to dress!' he exclaimed with ardour. 'The very sight of you and that alluring, flowery, gossamer gown is like cool waters to a thirsty soul!' He looked up with his boyish, confident smile.

'When you have quite done admiring my gown, may I remind you of the time?' But her lips were not inflexible.

He tried to take her hand. 'Dear Lorrie, you promised me that I might stay.'

'Promised?'

'Well, as good'—emboldened by her face—'and now that I am here I'm hanged if I don't find out why you have used me so badly!'

Lady Madesson retreated to the mantelshelf. 'If we are going to carry on an old quarrel'—— she began in a chill tone.

Wilford was quiet for a moment, contemplating her from head to foot; then he sprang up, and, kneeling at her feet, made as if to throw his

arms round her. 'Lorrie, why would you not see me? My eyes have ached for the sight of you!'

Lorrie had not been averse at any time from using her beauty to subdue men for her amusement, partly also with a desire—which seems buried in the hearts of most women—to witness the struggles of her victims. She believed in herself thoroughly, both in her power to fascinate and in her power to take good care of herself. Wilford, in his own way, was dangerous, as she had cause to know; but she had courted danger for the sake of excitement once, and she would face it again for Cahusac's sake now.

'Get up, Wilford, and remember that I have not forgiven the evening in Park Lane,' she said still more coldly, stepping beyond his reach.

He stood up with some awkwardness. 'It was your own fault. You had worked to make me jealous of that fellow Cahusac. By Jove, Lorrie, you have been cruel to me!'

'I think that you will allow that by your own conduct you forfeited any claim to my kindness.'

'Can't you understand that I was sore and angry? Surely I have been punished enough! Will you not forgive me even now, after all this banishment, after all you have made me suffer?' His handsome face was haggard. 'I swear to you I have been miserable! Miserable? I have been ready to shoot myself!'

She looked keenly at him. 'Therefore you tried to drown your misery?'

'Yes,' he answered defiantly; 'I had no other comfort.' Then, as she did not respond, he went on: 'Forgive me; be kind to me! I tell you I have thought over what a beast I was to you that evening until I could have shot myself. Upon my soul, Lorrie, if I could make up my mind to leave you behind in this condemned old world, I'd take my life to-morrow!'

Lady Madesson shook her head with a half-smile. 'Oh no, Wil, you wouldn't; I know you far too well to believe that.'

He lit up at the change in her tone. 'Then I am forgiven?'

'We will say no more about it, unless'——

'Dearest!' He took her hand, and with a sudden movement drew her down on the couch beside him. 'Lorrie, you have thought about me sometimes; you have relented a little?'

'Relented! About what should I relent?' Then, seeing the flash of strong emotion on his face, she hastily continued: 'You say I have banished you, but you banished yourself. I have seen you nowhere.'

'Didn't you know? I've been to Paris with De Sarsan. I was sent over by Alice to be out of the way of the family court to be held on my delinquencies. She always thinks I am safe with De Sarsan. What fools girls are! Paris at any time, you know, has its little snares for sinners like me, but this time'—— He laughed. 'Lorrie, you are lovely, but you have a great deal to answer for!'

He leant nearer, but she opened her fan and laid it between them. For the very first time in her life flattery and admiration gave her no pleasure. With an odd sense of having made a mistake, she felt that disgust had replaced the amused excitement which Wilford and his kind had been wont to awaken.

'Pray do not imagine you have made your peace. I don't think I like you to-day, Wil.' She turned away petulantly. 'Tell me about yourself.'

'The more I tell you about Paris the less you will like me, I'm afraid. But they were De Sarsan's friends mostly. One little fiend, called Ulpien Puyfot—oh Lord, to hear him! Ha, ha, ha!' He threw himself back and laughed.

'Puyfot. What was he?'

'A newspaper johnny. A rat to look at, but a genius by his own showing.'

A journalist, who was also a hanger-on of De Sarsan's! This sounded promising, so she asked, 'A genius! In what way? What did he talk about?'

'He says he has written a wonderful play which nobody appears to appreciate. As for his yarns, they are not repeatable—at least here. Once when he was hazy he mentioned Malcolm. Fancy Cahusac the hero of one of these stories!' He glanced at her with a grin. 'But let us talk of ourselves, Lorrie. Am I never to have an answer to the old, old question? Darling, I love you!'

'I wonder if you would love me so much if I were poor?' She put her arm on the back of the couch and her head upon her arm.

A whimsical expression crossed Lanceley's face. 'My dear girl, I should love you just as much and be as hot to marry you; but I don't know what the deuce we should have to live on!'

'What you are living on now, I suppose.'

His features assumed an odd grimness. 'I wonder how you'd like it! Do you know what I am living on now?' he asked, as though he had suddenly made up his mind to speak out.

'I haven't a notion.'

'On De Sarsan's charity,' he sneered. 'And beastly inadequate I find it by way of an income.'

Lady Madesson's astonishment was genuine.

'Oh, he's got his own little game to win,' resumed Wil. 'He won't be the loser. My family refused to have anything more to say to me, and so I was stranded, you see.'

'But your sister?'

'Her money's gone too, unluckily.'

Something in his aspect enlightened her.

'Wilford, you don't mean to say you'——

'Lord, Lorrie, shut up! I'm worn raw on that. Oh yes, I have had something to do with it, but it was partly her own folly. I refuse to talk about it. The only point I want you to consider is this—whether you care to have

your future husband hanging on to De Sarsan's pocket.'

Lady Madesson sat up straight and grave. 'Does your sister know of this'——

'Stop; don't give it a name! Matters are not so bad as you think. Nobody knows that De Sarsan's running me except Alice.'

'Poor girl!' The involuntary exclamation escaped her.

'Not a bit of it; she'll come out all right. Never you fear. I should be worse than I am if I had not provided for that.'

Lorrie was about to speak incisively, but checked herself. 'I have no right to ask any questions about her,' she said.

'No, perhaps it's better not. But this brings me back to the same place. Will you marry me, Lorrie?'

She stood up and moved away. 'Why should I? I feel no definite need of you. I am very happy as it is.'

'With me you would be very much happier. I am a beggar, and a bit of a rake. I don't pretend anything before you. I tell you the worst of myself, and you'—a real feeling broke his voice—'you know the best of me. You *make* the best of me! Have pity on me! Lorrie, I adore you; I could be anything you wished me to be! I used to think you cared for me a little once.' He had followed her, and stood with clouded eyes watching the effect of his appeal.

'Perhaps I did a little—once,' she said with a curious inflection in her tone which meant self-contempt, though he could not interpret it. Looking back, she remembered that his eager, boyish wooing had interested her at first, until she knew him. But now she hated him for it as she hated herself, and turned away that he might not see the hardening of her face.

'Sing to me,' she said after a pause. 'We will talk of all this another time.'

He gazed at the lacy folds which clung about her full throat; then his eye strayed to the curve of her cheek, the temple under its waving fall of dark hair. 'Lorrie,' he said with passion, 'I think I could die happy if I had but kissed you once!'

(To be continued.)

AS THE CHINESE SEE US.

By Rev. E. J. HARDY, M.A., Sometime Chaplain to the Forces at Hong-kong, Author of *How to be Happy though Married*, &c.

WE have been reading a great deal lately about the Chinese and what Europeans think of them, so perhaps it may interest our readers to tell them what the Chinese think of Europeans.

A missionary travelling in a boat was amused at overhearing a conversation of two simple countrymen. 'How much whiter his skin is than ours!' said one of them, looking at the missionary. 'Yes,' replied the other, 'foreign devils are very singular. They are born entirely white or entirely black.' The man's impression was that colour was as uncertain as in a litter of puppies, and that Sikh, negro, and Englishman all came from the same stock.

The Chinese call themselves the black-haired race, and all foreigners red-headed devils. A Chinaman, who had not the smallest idea of being deficient in politeness, confided to the writer that when he first saw foreigners he thought it extraordinary that they should have beards all round their faces, just like monkeys; but, he added reassuringly, 'I am quite used to it now.' This reminds us of what the people in another place said of a missionary: 'He speaks our language; if his whiskers were shaven off he would be nearly as good-looking as we are.' Chinese children often scream with fright when they see a European for the first time, especially if he has a red beard like the bogey-man depicted in their picture-books. The children thought that these were mythical personages—but no! there is one of them in the flesh. In the 'new territory' opposite Hong-kong I heard a boy, when asked whose was a certain house, reply, 'That's the devil's house.' He meant nothing more than that the only European in the neighbourhood lived there.

In the interior of China a foreigner is always suspected. He is supposed to be able to see into the earth and discover precious metals. If he is a missionary he is a political agent come to get himself killed, so that his death may be an excuse for land-grabbing on the part of some European Power. Should he offer any food or drink to visitors they think that it is poisoned. Many Chinese women are afraid to enter a foreigner's house lest they should be bewitched.

Chinese ladies dress, and do not undress, for evening parties, so they are shocked when they hear that Western women do the reverse—that when they go to Court they regard 'a bare skin as a mark of respect.' Chinese ladies are also concerned because their European sisters do not wear visible trousers, and have tight-fitting clothes that show their shape. Even upon a man tight clothes can only be explained if the poor fellow has not enough cloth to cover himself properly.

A Chinaman will feel the board-like shirt-front of a European with wonder, and ask if his collar does not cut his throat. 'What,' he asks, 'can

be worse for the health than to have the waistcoat of evening-dress open in front, thus exposing the chest, a most vulnerable part?'

A friend told the writer that the first time he gave a swallow-tail coat to a new Chinese servant to brush, he saw the 'boy' round the corner holding the garment up to the light and shaking with mirth. 'Why was it cut so in front and at the tails? What were the buttons behind for? How did the thing go on?' The Chinese think it strange that we should wear hats out of doors in summer when it is warm, and take them off indoors however cold.

What Celestials call our European odour is quite as nauseous to them as their smell is to us. Think of that, ye well-tubbed Britishers! A missionary friend, who is a very clean man, told me that he has often been pained by seeing Chinese hold their noses when talking to him. They say we smell because we eat beef.

The Chinese think that Europeans have neither religion nor morals nor manners, and only worship force as represented by big armies and navies. They say that, while we profess Christianity, its spirit influences our actions far less than do economic considerations; that Christianity is even less to us than is Confucianism to them; and that it is like our impertinence to send missionaries to China.

The Chinese think that we ignore and neglect the five great relationships which they learn in their classics: the relationship of sovereign to subject, of father to son, of husband to wife, of younger brother to elder, and of friend to friend. Celestials observe that in Western countries when a son comes of age he goes where he likes, does what he chooses, and has no necessary connection with his parents nor they with him, and they think this the behaviour of a grown calf or colt to a cow or mare—proper for brutes, but not for human beings.

The Platonic intermingling of sexes in Western society the Chinese do not understand; they think that our treatment of women is a mixture of imbecility, ill-breeding, and buffoonery.

A Chinese opponent of railways lately wrote that they would be useless in China as far as women are concerned. 'The wives and daughters of Europeans take no pleasure in staying at home; but in the case of our womankind, gadding about is held in great disrepute.'

The author of a native work called *The Sights of Shanghai* complains that foreigners and their wives stroll about in the public gardens arm-in-arm and shoulder to shoulder without any bashfulness whatever. For men and women to talk together in public is, in the opinion of the Chinese, bad; but for them to shake hands or take each other's arm is barefaced immorality. Etiquette in the Flowery Land requires that men and women passing things to one another should lay them upon a table instead of handing them directly.

When the Chinese hear of the Christian precept that a man should leave his father and mother and cleave to his wife, they are, if good Confucianists, horror-stricken; for Confucianism requires a man to cleave to his father and mother, and to compel his wife to serve and honour his parents also. We say that the Chinese worship their ancestors, and they retort that Western nations worship their wives. They hear of men amongst us adoring and being devoted to their wives.

The Chinese think that our manners are those of barbarians, and that we are always acting contrary to their saying, 'Politeness is better than force.' Certainly, the foreigner who does not take the trouble to learn even the alphabet of Chinese politeness cannot avoid giving frequent offence unconsciously. For instance, if he wears spectacles, and does not remove them when a visitor comes into his room, he will be thought very rude. The Chinese strongly object to be looked at through glasses. When we show manners the Chinese are surprised. A lady told me that, on a recent occasion, when she went into a shop at Canton the door was soon blocked up by a crowd of idle gazers. My friend, who speaks Cantonese well, said to the crowd in that dialect, 'I beg your pardon, would you allow me to go out?' They at once made room for her, and she heard them remarking, 'She speaks our language, and she has manners too!'

Our idea of progress is to have many railways and other modes of motion, and to be always 'on the go.' To the Chinese this seems to be morbid unrest. They say that we do not live, so intent are we in increasing the means of living, and that in consequence we are always discontented. The Chinese approve of the tramway-cars, lavatories, and fire-engines of the West, but many of our contrivances are, in the opinion of the educated, curious rather than useful, and in that of the ignorant connected with magic. Whatever he may pretend for the sake of advantage, the most unprogressive yellow man despises the most inventive white man. The inventiveness of the latter is, in the eyes of the former, no more worthy of respect than is the cunning of a fox or the strength of an elephant.

When we object to the smells in Chinese cities the inhabitants say, 'They are surface smells; they will evaporate;' and think that their system of drainage, or rather of no drainage, is far less dangerous than is our underground drainage.

Few Chinese visitors to England think as much of us as we think of ourselves. Rather they are shocked at the foulness of our city slums, at the drunkenness and licentiousness upon our streets, at our murder and divorce reports, at the figures of the national drink-bill. In their opinion our prisons are absurdly comfortable, and put a premium upon crime. They

admire, however, the school system by which we try to keep children from coming to prison.

The Chinese say that Europeans do not know how to make tea. To put milk and sugar into tea is as horrible, in their opinion, as it would be in ours to put them into champagne or into port-wine.

In China all the common acts of life are done not merely differently from our European way, but in an exactly opposite way. A man shakes his own hands and not those of his friend, and this he considers more sanitary than our method. Should he dine with his friend he will be placed on the left, for that is the place of honour, and not on the right, as with us. The dinner will begin, contrary to ours, with dessert, and end with soup and rice. A European takes off his hat to show respect to a friend; should you go into the office of a Chinaman, if his cap is off his head he will put it on. The mourning colour in China is white, and not black. A Chinaman wears a waistcoat over his coat, and not under, as we do. He mounts a horse from the off-side instead of the near, and holds the reins in his right hand and not in his left. The beginning of a Chinese book is where a Western one ends, and it is read from top to bottom in a series of horizontal lines arranged from right to left. The notes, if any, are placed on the top of the page. If a British boy is puzzled, say, in doing a sum, he scratches his head; but a Chinaman kicks off a shoe and scratches a foot. The fact that these and almost all other things are done in China in an opposite way from that in which we do them causes Chinese visitors to Europe to think that everything is upside-down. We seem to their eyes to be very absurd and little to be imitated. A good cure for self-complacency is to go to China and find out what the people really think of us.

THE WRATH OF ISHMAEL GOUDIE.

CHAPTER V.—RACK AND RUIN.

FOR some time after Mrs Goudie's death life at the Hainings proceeded on decorous lines. Her loss had a sobering effect on Goudie, who for a time forsook the companionship of his cronies, and, reforming his ways, acted the bereaved husband and the solicitous father to the admiration of his little world.

Then, as the novelty of the situation wore off, old habits gradually reasserted themselves, and matters slipped back into their former channels; with the difference that, the restraining influence of a good wife having been removed, they slipped yet farther back than before.

But John Goudie was not altogether regardless. Finding after a time that the women who were willing to take service at a farm where there was no mistress, and whose master had the reputation of tippling, were steadily deteriorating in character, and that the female domestics now employed at the Hainings were likely to prove bad associates for his young son, Goudie had the wit, in the third year of his widowerhood, to ask an unmarried relative of his, Mirren Dawson, to act as his housekeeper.

Miss Dawson was a 'purpose-like' woman of five-and-thirty. Under her conscientious rule the house once more assumed a homely aspect. Household waste was checked, meals were properly prepared, rooms regularly cleaned and aired, and the moths that had already taken insidious possession were banished from their strongholds.

While she kept order within, Ishmael toiled uncomplainingly outside to make the money that paid for Walter's needlessly expensive education, and enabled the farmer to return 'market-merry' from his weekly visits to the county town.

Walter Goudie had developed into a handsome lad, who was the pride of his father's heart. Unfortunately his nature lacked the moral fibre necessary to make him a fine man. His feelings had never been deep, and as time wore on he lost the affectionate regard for Ishmael that his mother had so carefully instilled. Seeing Ishmael's unwavering patience under his father's flouts, and the ungrudging service that he rendered for the wages of an unskilled labourer, Walter, who could not appreciate the beauty of self-sacrifice, came near to despising him.

John Goudie had the desire, so common with unlearned Scots fathers, to make his son a professional man. Unfortunately for his ambitions, study had no attraction for Walter, whose interest centred in horses. After some delay a compromise was arrived at by Walter deciding to become a veterinary surgeon. With the aid of careful coaching he succeeded in passing the matriculation examination that admitted him to the Edinburgh Veterinary College.

From the first young Goudie's progress gave little satisfaction to his professors, while the ever-increasing sums needed to defray his personal expenses made excessive demands on the rapidly diminishing funds of his father. The evidence of his unwarranted extravagance might have warned John Goudie that Walter found the distractions of city life more engrossing than study; but there are none so blind as those who refuse to see, and in the farmer's eyes the son of his old age could do no wrong.

Walter Goudie was in his twenty-first year

when, one winter day, he appeared unexpectedly at the Hainings, and, throwing down his bag with an oath, announced that he was home for good. The resolve had been forced upon him. A special exhibition of rowdyism in which he was chief actor had been justly signalised by his expulsion from the Veterinary College.

His bemused brain braced up by the failure of his cherished hopes, John Goudie made a praiseworthy attempt to initiate his son into the mysteries of farming. But the effort proved abortive. The only science in which Walter revealed the slightest interest was that of horse-racing; his one ambition was to attend race-meetings. Failing that expensive distraction, he loafed away the days, drinking a little at the village tavern, and having a good weekly blow-out when he accompanied his father to market.

It was at this juncture that Ishmael broke the silence of seven lean years by protest. His was the only brain clear enough to see that the existing conditions could not long continue. Between the farmer's slackness and his son's incessant demands for money, funds had gradually diminished until the banking-account was overdrawn. For two years Ishmael's nominal pay had not been forthcoming.

By dint of constant and arduous labour he had contrived to overtake the farm-work with the aid of only one man. Indoors, Mirren, too, worked hard; for the assistance of the servant lass was often required in the fields. She did her best, but one pair of hands cannot accomplish everything, and it grieved Ishmael to witness the gradual decay of the home in which Mrs Goudie had taken so much pride. The dining-room had degenerated into the meeting-place of soakers, who gathered to drink the whisky for which Goudie ran into debt, and to depart to prophesy with drunken solemnity the coming ruin of the host.

Once, when Ishmael entered the vacant room, the stale smell of spirits and tobacco drove him to throw open the window with a jerk that broke the rotten sash-rope. For the moment he was sickened by the recollection of the night when the farmer had called him into the room to taunt him with the birth of the son who was to be his master.

It was while his spirit was fired by the recurrent horror of the memory that Ishmael broke his resolute silence and uttered his warning—a warning that was met by jeering reminders of his own subordinate position, and supercilious demands to know what concern he had with the matter.

After that rebuff Ishmael went about his work with set lips and a hot and angry heart. His promise to the dying woman alone bound him to the farm.

At the close of a short spell of unusually sultry weather that occurred during the following July, John Goudie had a paralytic seizure. For a week he lay dumb and motionless. Then his faculties gradually returned; and, though he never again completely regained the use of his left side, his speech came back, and he was able to be wheeled about the house in a chair.

As the weeks wore on Walter usurped the province of master, treating Ishmael worse than a dog, cajoling the old man if he wanted to get anything from him, and when money was not forthcoming strolling about the farm with a gun.

After a short absence on a bout of dissipation, the funds for which were procured from the sale of his mother's little store of jewellery, he reappeared at the Hainings in worse case than ever. Matters had gone ill with him. He bore unmistakable sign of a debasement that was both physical and moral.

The ensuing days were wretched ones. Unable for lack of coin to leave the locality, he loafed about the steading, revenging his baffled cravings on any hapless creature that came in his way; while the old man, sitting half-imbecile in the wheeled chair by the kitchen fire, applauded his every utterance as the essence of humour.

Through it all Ishmael went about his work with his usual dogged persistence, keeping his pledge, and labouring as faithfully as he had done through so many thankless years. Though Ishmael did not know it, he was working beyond the limits of his endurance; for during the past winter signs—their grave nature unrecognised as yet—of incipient heart-trouble had harassed him.

It was while he was resolutely setting himself to avoid open war by keeping as much away from the house as possible that a crippling accident befell him.

Walter had taken out a young horse—one that Ishmael had reared with special pride and with a secret hope that he might help to restore the falling fortunes of the family—and had brought him home badly lamed.

Discovering the injury, Ishmael was in the stable trying to alleviate the pain, when the animal, maddened by suffering, kicked him on the knee.

It was the most disastrous thing that could have happened. Owing to the hard winter and their lack of hands, much of the crop was yet unsown. To be rendered impotent at such a time was an incredible misfortune. Ishmael would fain have regarded the injury as trivial; but the excruciating pain caused by every movement gave incontestable warning of the folly of such a proceeding.

Kindly Dr Mickle from Braeside, who chanced in passing to call on the farmer, insisted on examining the knee, and plunged Ishmael into the depths of despair by prescribing complete rest, and promising him permanent lameness

if he attempted to use the limb for several weeks.

Beaten at all points, Ishmael set his teeth and grimly endured. For two endless days he lay in his attic room. Then, unable longer to lie still, and eager to see how the horse was progressing, and to give some necessary instructions about the farm-work, he dressed and hobbled downstairs, only to sink down, faint and sick with pain, on the worn horsehair sofa in the kitchen.

By the side of the fire the farmer sat dozing away his days. The only thing that now had power to arouse him was the presence of his son. When Walter entered the room, were he drunk or sober, the old man never failed to awake. His features assumed an air of expectant interest, and his flaccid lips curved in a smile.

It was still early in the afternoon. The dinner of thick barley broth and hough, and potatoes boiled in their skins, had been cleared away, though the atmosphere was still heavy with its odours. In the scullery Mirren Dawson was washing up the dishes, for the servant lass was out in the 'laigh field' helping Dan Forgan, the ploughman who had succeeded Bauldy Stewart.

Ishmael was half-sitting, half-lying on the couch, trying to endure the pain his walking had induced, when Walter Goudie swaggered into the room.

'See here, Ish, I want some money,' he said. 'I 'm going to Edinburgh in the morning, and I must have it.'

Ishmael gave no sign that he heard.

'D' ye hear me speaking?' Walter demanded. 'I want money.'

'Then want must be your master,' Ishmael, goaded on to speech, made reply; 'for ye 'll get nane here.'

Walter had already been drinking. His lips were tremulous, his eyes bloodshot. He attempted to domineer. 'And who are you to say what I 'm to have, or what I 'm not? That 's what I 'd like to know. Who gave you authority here?'—'Mirren!' he shouted when Ishmael refused to bandy words with him—'Mirren, give me what money you have.'

Appearing at the door of the scullery, a steaming dishcloth in one hand, the plate she had been washing in the other, Mirren protested. ''Deed, man, I havena a penny in the house forbye the twa-three ha'pennies the weans brought for the milk this mornin'. An' when he left the bread yesterday the baker was speirin' if it would be convenient to pay him the day, for he had a heavy bill to meet.'

Baffled, Walter sought the feeble mind's refuge, and tried to relieve his ill-temper by cursing. 'I 'm for Edinburgh the morn, an' money I must have,' he blustered.

'There 's the butter that was churned this mornin',' Mirren said hesitatingly. 'I dinna usually deliver it till nicht.'

'Away wi' ye! Take the butter to the folk this minute, an' mind ye get the money in yer hand, an' bring it straight back here.'

'An' if she gives ye the butter-money, what 's to keep the hoose, an' get the auld man what he needs, Walter Goudie?' cried Ishmael, starting up on the sofa with flaming eyes. 'Ye were born into a warm, weel-lined nest, an' now ye 've rooked it wi' yer wanton prodigality.'

Sitting down heavily on the edge of the solid kitchen table, Walter stared defiance at him, his red-rimmed eyes gleaming from a pallid face that was already lined by indulgence in evil passions. 'Oh, ho! so I was born into a warm, weel-lined nest, was I?' His tone was ponderously sarcastic. 'An' if I was, what did I find there? A cuckoo in the nest; that 's what I found there. A d—d silly cuckoo.'

'Tee-hee, tee-hee!' sniggered the old man delightedly, as though applauding a rare witticism. 'That 's a good one, Wattie. A cuckoo —tee-hee-hee!'

Within earshot in the milk-house, Mirren was hurriedly wrapping the rolls of firm yellow butter in cabbage-blades, and packing them into a basket. She was a peace-loving woman, whose one desire was to avoid getting mixed up in family feuds, and she longed to be out of the house before the threatening storm broke.

'Ye found a weel-plenished hoose, an' guid siller in the bank,' Ishmael went on, 'an' though ye 're no' twenty-two yet, ye 've squandered it so that if it hadna been for me there wouldna be a roof ower yer heid this day. An' if ye persist in yer wicked wastrel way, do what I can to prevent it, there 'll no' be a roof ower yer heid come the back-end o' the year. Mind ye, I 'm warnin' ye!'

Taking her hat from the peg on the back of the kitchen-door, Mirren seized the basket and set off on her errand, thankful to escape from an air so surcharged with hostility.

For a time Walter continued to bluster; but Ishmael, who had said his say, taciturnly refused to be drawn into further controversy.

Irritated by his persistent silence, Walter at length started unsteadily to his feet, and, with the avowed intention of finding money somewhere, went upstairs. The listener in the kitchen could hear him walking about the bedroom overhead—the room in which he had been born, and where Ishmael had first seen him—pulling out drawers and shoving them roughly in again. Then his steps, moving stealthily now, went higher, and for a time there was no further sound.

Lulled by the warmth of the fire, the old man was nodding in his chair, and a brief cessation of the intense pain had just enabled Ishmael to fall into a light doze, when Walter's steps again echoed on the stair, and he burst into the kitchen.

In his hand he carried something loosely wrapped in brown paper. Throwing it down on the table, he contemptuously shook out the pauper raiment—the sole possession that Ishmael had carried into his new life.

'See, faither,' Walter cried hilariously, holding up a little pair of trousers. 'Them that seeks finds. See what I've gotten. These are the grand claes our fine gentleman there wore afore he left the poorhouse to gaffer us a' at the Hainings!'

'Ay, I mind fine. A puir object he was,' chuckled the old man. 'A dour, wee cowed beastie.'

Ishmael had been growing paler and paler. In a black, surging flood the anger that all through these hapless years he had kept under was rising within him. Stounds of agony throbbed through his injured knee; his enfeebled heart jerked painfully. But still he strove desperately to keep control of himself.

Standing by the table, Walter Goudie, who was enraged at his search having been unproductive of money, was tossing over the little garments, addressing them derisively the while.

'He wasna fit to bring into a decent, God-fearing hoose; I aye telt yer mither that, Wattie,' whimpered old Goudie. 'She shouldna ha'e ta'en him. I aye said that. If she'd listened to me she'd never ha'e done siccan a thing.'

The pot of water with which Ishmael had meant to bathe the horse's hock was boiling furiously on the fire, but no one noticed it. A gentle tap at the open door drew their attention to Jocky Forgan, the half-witted child of the ploughman, who had come to fetch a can of butter-milk.

Seeing him, Walter smote the table with his fist, and burst into a loud laugh. At the sound of his mirthless amusement a smile chased the distressed look from the old man's face. His son was his weather-glass.

'Come awa' in, Jocky, my clever man,' Walter cried, welcoming him with affected heartiness. 'Come in, laddie, an' see how ye would like to try on some braw new claes. There now'—he put the glengarry bonnet on the touselled head. 'That sets ye fine. Yer ain mither wouldna ken ye, Jocky, wi' that bonnet on yer heid, an' this fine cravat round yer neck. An' see.' He held out the little breeches enticingly.

Ishmael had risen to his feet; his eyes were blazing like torches in a livid face. 'Gang awa' hame, Jocky,' he said quietly. 'This is no' a place for you. Run hame to yer mither.' His voice was little more than a whisper, but his tone was one that even the half-witted boy knew must be obeyed.

Limping painfully across the floor, Ishmael gently thrust the child out, and closed the door on him. Then turning to his tormentor, with the insults of many ignominious years to avenge, he said quietly, 'I've a long score to settle wi' you, Walter Goudie, an' I'll settle it noo.'

(To be continued.)

OLD ABERDEEN NAMES AND GAMES.

IT is always a fascinating work to trace the history of a town, to survey its growth from its foundation, to follow it through its youth and middle life, and to survey it in its old age and full development. Perhaps the best way to do this is to make a study of the names of its streets, find out why they were originally made, in what way they were named, and why they received the names they bear now. Aberdeen is fortunate in having a topographer, a savant learned in the past, who has written an admirable little book* upon the street-names of his own town; and this book will give entertainment to many who, like the present writer, are not Aberdonians, but are yet interested in that 'silver city by the sea.'

The earliest record the author can find of a 'street-name' in Aberdeen goes as far back as 1212, and occurs in a charter granted by the Abbot of Arbroath to a burgess of Aberdeen. The street is called in the Latin original *Vicus Fraxini* (the Road of the Ash-tree), and he identifies it with the Netherkirkgate. He points out that in Scottish towns the principal street-names were originally not names at all in our sense of the word, but natural descriptions of the chief ways. Thus we find in most of the older burghs names like Castlegate, High Street, Gallowgate, and Cowgate, for the simple reason that they are descriptions of the position or uses of each 'gate,' which was the old Scottish word for street.

The centres of the old town were the castle and the 'forum' or market-place. The former dated back to 'the beginning,' and was the scene of many historic deeds; and the latter had adjacent to it the *hostilagium* or king's warehouse, which can be traced back to 1219. As in most old Scottish towns, and as specially might be expected in a town whose ancient motto, 'Bon-Accord,' shows its connection with France, many of the Aberdeen town-names were derived from French forms. The Vennel is the French *venelle*, a narrow lane; the wharves are not wharves, but 'quays' (*quai*); there are many

* *Aberdeen Street Names.* By G. M. Fraser. Aberdeen: Wm. Smith & Sons, The Bon-Accord Press.

'places' (*place*); and there were gates called 'ports' (*porte*). There were six ports or gateways, all of which have now disappeared, in old Aberdeen—the Justice Port, the Futty Port, the Shiprow Port, the Nether and Upper Kirkgate Ports, and the Gallowgate Port, most of which existed before 1434. The Justice Port rightly bore that ominous name, for not only did it lead to the Heading Hill, but on it the dismembered limbs of malefactors were 'spiked' to encourage the others. The Futty Port and Futty Wynd give a good instance of a distorted place-name. Futty is now often written Footdee, from an imagined derivation from the river Dee, but its origin is *tout autre;* it was originally named from the old chapel of St Fotinus, popularly St Foty; hence through the ages came the changing forms Futty, Footie, and finally the barbarous Footdee. Another interesting change of form is found in the last of the names of the four older streets—Castlegate, Shiprow, Gallowgate, Guestrow, whose names make a metrical line. The name Guestrow was much more interesting originally than it is now. From its proximity to the graveyard of St Nicholas, the street was at first happily named Ghaistraw or Ghost's Road (it is translated *Vicus Lemurum* in a Latin charter), an impressive evidence of its relation to the uncanny neighbourhood it stood in.

The author has much to tell us about the Aberdeen Tron and the Mint; and Rotten Row, he points out, has, here at least, more connection with 'rottons' (rats) than the similarly named place in London. Poynernook Road derived its quaint name from the old burghal 'pynours' or shore-porters who had their headquarters there. Huxter Row and 'Buth Rawe' (Booth Row) explain themselves; Mounthooly seems to mean the Holy Mount, and Kittybrewster to be derived from the brewing (browster) land attached to the Bishopric of Aberdeen, and not from any mythical heroine called Kitty Brewster. Spital as a street-name commemorates the old hospital founded in the twelfth century by Bishop Matthew de Kininmond, and Exchequer Row is the easier representative of the old name 'Skakkarium' (Scaccarium), or King's Custom-House of Aberdeen.

So much for the older names. We are also told much, however, about the names of the streets called after local associations or their original builders, and those called after the 'weel-kent folk.' Marischal Street represents the site of the town house of the noble Keiths, Earls Marischal of Scotland, from the walls of which Queen Mary unwillingly witnessed the execution of a Catholic Gordon, and which was the scene of the Jacobite lords' disappointment after 1715. Burnett's Close was so called from the Burnetts of Elrick, worthy burgesses, but not too proud to smuggle. Peacock's Close was named after Francis Peacock, appointed—and this refutes the charge against Aberdeen of being a grim, relentless town—in 1747 'sole dancing-master of the burgh of Aberdeen'! Cruden's Court is reminiscent of the pious compiler of the *Concordance*. Shoe Lane was laid out by the Shoemakers' Guild; while the odd names Luxembourg Close and Patagonian Close seem to owe their being to 'the taste and fancy' of their former owners. Virginia Street represents the abortive sugar industry, and Constitution Street the unrighteous zeal Aberdeen showed in resisting Catholic emancipation. A new class of names—borrowed from London—arose in the eighteenth century. We find Long Acre, followed by importations from Mile End to Whitehall, names one could have done without—in Aberdeen. Then there are the myriad modern names, the Frederick Streets, Charlotte Streets, Queen Streets, &c., common to every town; but one notices that even in 1807 a grumbler objected to one of them, saying that 'Princes Street is most unhappily named, unless it be in compliment to the Prince of Darkness.'

There is one name which may cause us to digress before we finish—that is, 'the Bowl Road.' This was the road which led to the public bowling-green at the Links, and the latter are described in 1661 thus: 'The Lynkis extend themselves almost betwixt the two rivers of Done and Dee. Heer the inhabitants recreat themselves with several kynds of exercises, such as football, goffe, bowling, and archerie.' If any one desires to know how the inhabitants of Aberdeen amused themselves at 'goffe,' a recent book* will be instructive. In the first place, that game was included among the 'unlawful amusements' in 1565, which was in itself enough to make it popular. It became so. Golfers played (in 1613) even in the churchyard, and (1637–41) even on Sundays! They continued to play in spite of many rebuffs—but on week-days, and quietly—till 1780. Then they founded a 'Society of Golfers in Aberdeen,' and in 1815 the Aberdeen Golf Club was formed. This took in the remnants of its predecessors, and has now published a handsome volume of its records, which we recommend to all golfers and lovers of Aberdeen.

HOW SEYMOUR CAME OF AGE.

By W. Victor Cook, Author of *Odin's Treasury*, *Anton of the Alps*, &c.

CROUCHED in the lee of the Bank, amid the flying sand and the long, coarse grasses that hissed in the gale, Mark Seymour lay and listened. The tumult was frightful. The wind screamed in his ears; the salt spray, mixed with grit and pebbles, cut his face and nearly blinded him as it was swept across the Bank. Every few moments the whole shore shook as at the discharge of heavy artillery, and the deep roar of the shattered rollers sounded along the beach. Then came the long grind as the backwash dragged at the shingle, and again followed the thunder of breaking water. It was still three hours before the tide would be high.

Young Seymour trembled as he lay against the Bank. People said he was a coward, and he had fought hard against the timidity of his disposition; but the fear that was on him now seemed to convict him. Slowly he dragged himself a few inches above the top of the Bank, and, with his hands up to protect his eyes, peered out over the sea. A waste of foam-whitened waters writhed before him, streaked by the lashing of the gale. The autumn dusk was falling, and soon it would be dark.

With his eyes streaming from the wind, Mark turned to look behind him. There stood the strong stone house which his father, the keeper of the Bank, had built twenty years ago, when the wide Tessler estuary was reclaimed from the sea. The little seaward windows were closely shuttered, and from the squat chimney the smoke was driving horizontally out across the flats. Somehow the house reminded Mark of his father, sturdy and plain, inured to wind and weather, alone yet unafraid. Who but his father would have undertaken the lonely responsibility of keeper of the Bank, to maintain the Vale of Tessler against that ravening sea from which man, greatly daring, had snatched it? Not only his own and his family's lives had Mark's father taken in his hands, but the lives of all the dwellers in the scattered homesteads that had grown up in the basin of the old-time estuary.

Mark looked from the house to a higher structure beside it, raised on a great mound that his father had faced with stone and cement. On the top was a small, rounded erection of stone, shaped like a beehive, with the opening facing landwards. They called it the Tower of Refuge. Inside there were cork-jackets and life-belts, and a small, strong boat that would hold half-a-dozen people. Neither the tower nor the boat had ever been needed yet; but Mark's father had been a sailor, and he kept them always in repair. 'You can never trust the sea,' he said. And it was four miles to the nearest rising ground.

A tug at his arm made Mark look round suddenly. It was his little brother, whom they called Gipsy because of his thick, brown curling hair and laughing, mischievous eyes.

'Hallo, Gip!' said Mark. 'You'd better go in. You'll be blown away.'

'I *don't* think!' cried the little, shrill voice in his ear. 'I say, Mark, look at my river. Ain't it fine? I'm going to play battleships.' He held up a toy boat, and, with the glee of eight years old, pointed to a narrow rivulet of water that was dribbling away landwards from the foot of the Bank.

At the sight of that small, meandering trickle Mark sprang down the Bank and stood staring. For the moment panic gripped him. The Bank was giving way! And the tide would not be at the full for three hours yet!

Boom! boom! The deep thunder of the sea was like the guns of a triumphant enemy.

Little Gip pulled his elder brother impatiently by the hand. 'Come on! You be the Germans, Mark!'

Gip had never been afraid of anything. Mark would have given a fortune—if he had had one—to be brave and careless-hearted like his little brother. Instead, he had always had the reputation of timidity. Even in the midst of his present fear he recalled how, at a dance the week before, at the Tessler schoolhouse, they had spoken of his approaching coming of age—he would be twenty-one to-morrow—and he had overheard the schoolmaster's daughter Maisie, an imp of seventeen, say he ought to have been born ten years earlier, 'because twenty-one years was not enough to make a man out of such poor material.'

'Come on, Mark; what 's the matter with you?' cried little Gip.

The runnel of water was a little wider now where it came under the Bank.

Suddenly Mark gripped his brother's arm so hard that the little fellow started. 'Gip,' cried he, 'you 're brave, aren't you?'

'I ain't as brave as father,' said the boy. 'I say, Mark, just listen to the horses!'

There was a confused noise from the low stable close at hand.

'Gipsy,' said Mark, speaking in the boy's ear because of the roar of the storm, 'you 've got to be very brave, and look after mother. Father can't be home to-day. Run up into the Tower of Refuge, and light the fire, and loose the oars in the boat, and untie her. I'm going to bring mother to you there.'

Gip's round face grew preternaturally solemn. 'Oh Mark!' was all his comment.

'The Bank is going to burst, Gipsy,' said

Mark. 'It won't last long, boy. That water is the big sea coming through.'

'Shall we be drowned, Mark?' The child looked up with a scared yet trustful face.

'No, no!' cried Mark, with a lump in his throat. The sight of the small, grave face so full of childish trust sent a sudden fire through his blood. 'You won't be drowned, Gipsy, if you do as I say. Run along and light the fire.'

The boy ran off, without a word, and went up the steps to the tower.

Mark entered the house, where his sick mother lay. People said it was from her that he inherited his timid spirit; yet her fears were never for herself. He took her hand. 'Mother, it's a wild storm, and the Bank is giving way,' he said. 'I'm going to take you up into the tower, and leave you with Gipsy for a while.'

'Ah!' The sick woman instantly understood all the peril that was implied. 'And where are you going, Mark?'

'I must warn the Vale of Tessler,' he answered. 'The folk will be drowned like rats if they have no warning.'

'Take Gipsy with you,' said his mother.

'I can't,' he said. Looking out of the window, he saw his fears confirmed. The water was coming under the Bank in a broad stream. 'Mother, I must ride the Black Duke; the pony could never do it in time. It will be a wild ride, mother. Come!'

'You—ride the Black Duke!' she exclaimed incredulously. Mark had never ventured to mount the great, fiery black horse that his father kept.

He nodded his head. 'Come,' he repeated, 'there's no time to lose, mother.' He wrapped her up, and, half-leading, half-carrying her, got her up the steps to the tower. His little brother had lit the fire in the grate. Mark ran and fetched some food and water, and made a bed for his mother on the floor of the tower.

Then Mark took Gip by the hand, and led him to the door that faced landwards. 'Gipsy,' said he, 'if the sea wets the top step there before the tide turns, get mother into the boat, wrap her up as warm as you can, and then get in yourself too. The vale will all be covered with the sea, Gip, and you must let the boat drift as far as she will inland; but as soon as the tide turns you must let the anchor go. See, I have hung it ready in the bows.'

'Yes, Mark,' said Gipsy. 'I wish father were home, Mark!'

'Wishing's no good,' answered Mark. 'Gip, you're a brave boy. You and I have got to save mother and all the people in the Vale of Tessler, so, whatever happens, you must not get frightened.'

'No, Mark,' said the boy, staring with big eyes at the water spreading out below.

'The sea will wash down the Bank, but you must not be frightened,' said Mark. 'And it will cover up our house, but you and mother will be safe. Don't get into the boat unless the waves come up to the top step, Gip. And, remember, I'll come back as soon as I can. I'll bring the coastguard from Garton Point. Goodbye, Gip.' He stooped and kissed his brother, and then ran down the steps. Already the water was up to his ankles as he waded to the stable. At any moment the mass of the shingle Bank might give way with a roar and a rush of the engulfing sea.

In the stable the pony and the big black horse were nearly wild with panic—the instinctive terror of dumb beasts that feel death is near. Mark flung open the door, and untied the pony's halter. With a splash and a mad clatter of hoofs the pony rushed out, nearly knocking Mark over in his bolt.

Now to saddle the Black Duke! The terrified beast was in a lather of sweat, rolling his eyes, and tugging wildly at the halter that held him to the stall. Before this day of stress Mark had fought shy of him. But to-day, for the first time in his life, he had met death face to face, and the vision, like a strong and bitter tonic, had steeled his heart and brain to a kind of unconscious, mechanical courage. For once his way in the world was clear. There was only one thing for him to do. There was no longer the cost to be counted, no more bargains to be struck with Destiny.

There is something in the mere absence of fear which exerts a steadying influence upon such—man or beast—as are under the spell of terrors. With no thought of possible consequences, Mark walked straight into the stall where the great horse was straining at the halter, and took down the saddle-gear from its hook upon the wall. Then he proceeded to fasten it on, speaking to the frightened beast with soothing, ordinary words. Once or twice the Black Duke plunged violently, sending up a smother of spray from the water that was now up to his fetlocks; and once Mark was flung with force against the wooden partition of the stalls. But after that the horse stood still, though his body trembled all over and his sensitive ears twitched and lay back, and his eyes rolled round fearfully at the young man. Mark tightened up the saddle-girth, and the Black Duke allowed himself to be bridled.

Mark got at once into the saddle. He dared not lead the terrified horse outside, lest, driven to frenzy by the sight of the rising flood, he should bolt away riderless. Lying along the animal's quivering neck, Mark guided him out of the stable without mishap.

The salt, wind-flecked water, all discoloured with sand and mud, was now over the horse's fetlocks, and stretched away landward in a long, shallow lake.

There was no need for Mark to strike his heels into the Black Duke's heaving ribs. With a bound that nearly unseated his rider, the great

horse sprang forward towards the Vale of Tessler. With staring eyes and dilated nostrils he galloped along, leaving a whity-brown streak of wind-driven foam in his wake.

For some minutes Mark's whole energies were devoted to keeping his seat on that bounding black back. But though he had been a timid rider he was not a bad one, and by-and-by the exhilaration of this wild flight began to lay hold of him. They were clear of the water now; but well Mark knew that as soon as the Bank caved in, as it must, the sea would pour through the flatness of the vale like milk spilt over a tray. And the night was upon them. He had no need to urge his horse; the Black Duke seemed to know. The white foam dripped from his bridle, but there was no slackening of the head-long flight. The clatter of his iron shoes struck with machine-like regularity along the ill-made road that led through the vale. Suddenly, in the deepening darkness, the clatter became muffled. The flying hoofs splashed instead of hammering. A tremor went through the racing horse. The water again!

Mark Seymour set his teeth, and stooping lower over the Black Duke's neck, patted him, and spoke encouraging words.

The Bank was down at last!

On a little, raised piece of ground just ahead a light twinkled—the first farmhouse of the vale. Mark galloped up the rise, and for a moment reined in under the window. He raised his riding-whip, and next moment there was a crash of shattered glass. An angry face appeared at the window.

'The Tessler Bank is down, and the sea is coming in!' shouted Mark. 'Loose your cattle, and save yourselves quickly!'

'God help us!' cried the man at the window, and he disappeared.

Down again galloped the Black Duke into the night.

One by one the scattered farmsteads along the Tessler road were warned. In some the folk were already alive to their peril. In others men and women awoke in panic to the startling cry, 'The Bank has burst! Save yourselves from the sea!'

The sweat rolled off Mark as he rode. Even the enormous strength of the Black Duke was wearing out, though terror still spurred him to speed. Again, though now they were miles distant from the sea-breach, the swiftly rising water was over his fetlocks. And still, Mark knew, the salt flood must be roaring and eddying through the breach, and it wanted yet two hours to the full spring-tide.

There remained but one house to warn—the schoolhouse. It lay a little off the road, in a solitary position, about half-way between Tessler Church and Garton Point. Towards the schoolhouse the land rose very slightly, and it was the remembrance of this fact, as well as the house's isolated position, that had induced Mark to leave it to the last. But now, with a sudden pang, it came to his recollection that though the ground rose a trifle in that direction—a matter of a few feet at most—the schoolhouse itself stood in a well-defined depression of the surface. Moreover, it was a long, low building of a single floor, and the schoolmaster's private quarters consisted of a small bungalow adjoining.

The water through which the Black Duke forced his way was knee-deep now. There was another mile to go to the schoolhouse. The water deepened a little as they forged along, showing that the flood was still making, but on the slight rise towards the school it shoaled to the horse's feet, and the going was by so much the easier. Yet the ground was never quite uncovered. The whole Vale of Tessler was now like one vast lake in the darkness. Here and there trees stood up out of the dark surface, and against the blackness of the stormy sky extended the deeper black of their spreading branches. Only those who knew the vale like the palm of their hand could have ventured to seek their way from one point to another of this great, gale-swept, black lagoon, over whose surface the lashing wind drove foamy waves like a flock of frightened sheep.

By-and-by the water deepened again quickly as Mark rode. The Black Duke, all weary as he was, grew restive, snorting and holding back as the splashing wavelets reached his saddle-girths. Straight in front of him Mark made out the dim line of the schoolhouse roof. The house itself lay in darkness, half-submerged by the flood. Where were the inmates?

Making a trumpet of his hands, Mark sent a hail through the blustering of the storm.

A girl's clear voice replied. 'I'm on the roof!' she cried.

'And the others?'

'Gone to Garton Point.'

'They can't get back!' cried Mark. 'The Bank is down, and the sea is rising.'

With hand and heel he strove to urge the Black Duke forward. But already the exhausted animal was nearly carried off his feet by the flood. He would go no deeper towards the house. Mark knew that if he left the saddle the horse would run off and leave him and the girl to their fate.

'My horse won't come closer, and if I swim to you he will leave us!' he cried.

'Wait a minute,' came the answer.

Mark waited. The darkly outlined figure vanished from the line on the roof. He saw something light against the darkness of the house. Then from the water beside him the girl's voice hailed him. She had swum to him from the house.

Mark got her on the horse, and himself slipped into the water. 'Now,' said he, 'ride for your life, Maisie. I will hold on alongside.'

Slowly the black horse struggled up out of the deepening hollow around the schoolhouse. At first Mark was towed along through the flood, but by-and-by he could touch the ground. Gradually the water shoaled to the higher ground towards Garton Point. Wet through as they were, and cold with the driving wind, they knew then they would win clear of the flood.

'I say, Mark,' said the girl after a time, her teeth chattering a little, 'I'm sorry I said that about you at the party.'

'Never mind,' gasped Mark. 'Go on—hurry!' He struck the Black Duke with his hand.

But, instead of going on, she stopped dead, pulling up the horse. 'Where are your people?'

'God knows!' said Mark. 'Go on, or we won't save them in time!' He almost shouted at her.

They were clear of the water at last. A light twinkled faintly ahead.

'There's the coastguard cottages,' said Mark. 'Get off; you're safe now, Maisie.'

He helped her off. 'You must walk to the point,' he said not unkindly. Next minute he was on the horse again, urging the outwearied beast by voice and hand and heel toward that dim, glimmering light.

At the door of the first low stone cottage Mark rolled off, trembling with exhaustion and eagerness. He struck fiercely on the door. 'Tessler Bank is down!' he shouted in the face of the man who came. 'Get the galley out, quick!'

The thick-necked, great-chested sailor needed no second bidding. Pushing Mark to a chair, and setting a glass of liquor in front of him, he ran to call his comrades.

In five minutes the galley was being run down the shingle on the lee side of the point. With a shout like men charging an enemy, the coastguard, breast-deep, rushed her into the sea, then tumbled aboard together with the precision of a machine, and the next minute the big boat was forging through the waves, urged by the strength of a dozen brawny arms.

Across the water the distance was short. But the murk was thick, and fear was in Mark's soul for the sick woman and the little boy left alone in the midst of the storm. And then, suddenly, his fear was turned to triumph. A blurred light came from the sea ahead. His father's tower had stood the strain! The great shingle Bank was down; the hungry sea was swirling and eddying about the tower's knees; the wind was screaming about the stone shelter on its summit; but the stronghold that his father had built so carefully against the waves had served him well at need, and saved his wife and child. A great pride in his father filled Mark's heart.

'Steady, lads! Steady there!' cried the coxswain, as the galley writhed among the eddies that foamed through the breach. 'Give way now!'

Like a canoe shooting rapids, the great boat slid through.

'Easy all!'

Just in the lee of the tower there was a patch of calm, though the sea swirled powerfully about the stone base. The galley ran close in, and a couple of coastguards sprang with Mark upon the steps.

The tide had nearly reached the top. Mark saw a small figure bending over his father's boat. Then a boyish shout went up, as he was seen, 'Hurrah, mother, it's Mark!'

Mark met his mother in the doorway, and the coastguards carried her to the rescuing galley.

'Jump in, Gipsy!' said Mark to his brother, and presently they were all making for the land across the flooded vale. Mark told the story of the flood, and they rowed where Tessler village had been, in case any should have failed to make their escape in time.

'You've had a close shave, all of you,' said the coxswain. 'Your father knew something, Seymour, when he built that tower.'

'Yes,' said Mark. He was dead-beat, now that the struggle was over.

'Let's see,' continued the coxswain; 'it's high-water at midnight. Must be close on midnight now.'

'Then it's nearly to-morrow!' said little Gipsy.

'Ay, so it is,' said the coxswain.

'Why,' cried the boy, as one stumbling upon a great discovery, 'then you'll be twenty-one. You'll be a man, Mark!'

The coxswain chuckled. 'If he ain't a man to-night, then I'm a Dutchman, sonny,' said he.

And that was how Mark Seymour came of age.

INCHCOLM ABBEY.

GRAY house of rest on that sweet isle reposing,
Against whose walls the waves beat evermore,
I come to thee, for day is at the closing,
And worship kneeling on this rock-bound shore.

Like unspent tears the waters soft are falling
Around my feet, and from the island there
I seem to hear the bells at vesper calling
The silent brothers to the hour of prayer.

Along the Forth, where silv'ry sands are gleaming,
Great beech-trees wave their messages to thee;
And westward, where the twilight glow is streaming,
Heaven's glory gilds the old church by the sea.*

On yonder shore the evening lights are burning
Like jewels laid upon the city's breast;†
And through these isles the laden ships returning,
Pass slowly home to anchorage and rest.

Gray house of peace, the sea-gulls round thee sweeping
Fold their soft wings and bid my soul farewell;
While o'er the deep, where phantom mists are creeping,
There comes the tolling of the abbey bell.

GILBERT RAE.

THE GENEROSITY OF THE RICH.

By Mrs ROBERTSON-GLASGOW.

IT is very often the habit to speak as if quantity were the sole measure of value, as if it were impossible for the rich, merely because they *are* rich, to miss what they give away, and therefore to deny them most emphatically the virtue of generosity. Who has not heard it said of some rich person, 'What is a hundred pounds to him? He will not miss it;' with always the little tag, expressed or understood, 'but *we* have our farthings very much to our credit'? There is even the same underlying suggestion in speaking of other kinds of riches. 'The So-and-sos have a large family; they will not miss one as they would if it were an only one!' But this is a false argument, and very often the exact opposite is the case; for the more one has the more one is able to appreciate the mere joy of possession. Money may be plentiful, but it never comes and goes unnoticed; it adds so largely to the usefulness as well as to the pleasure of life, it brings such uncounted benefits in its train, that its possessor would be ungrateful indeed if he let it slip through his fingers like water. Certainly, in the other case, of which I can speak with a more certain knowledge, it is not a fact that the love which would be concentrated on one is divided by the number who have to share it; it only means that the love is so many times multiplied.

A man clings almost instinctively to what he finds the greatest material good; and to one who has felt the joy of possession it is a real effort to 'go without,' for to him the luxuries of life have become necessities, and he often appreciates them more than one who has never enjoyed them. There is a manner of speaking that implies that it is always virtue and poverty on one side, with money on the other. But I cannot see that the poor have the monopoly of the virtues; and, even if they imagine they have, I think we may fairly suppose that they would be willing to change places, and see the other side for themselves.

Life is not presented to us as a whole. We are never called upon to make a choice between riches and virtue or riches and love. Many poor people are unloving; many rich ones are blessed. Because a man is poor it does not necessarily follow that he is a good husband—though he often *is!*—or has virtuous surroundings, or immunity from disease and death; indeed, the want of money is a persistent and narrowing factor in life, which tells adversely on many characters, and it is often only the generosity of the rich that makes such lives bearable.

So, to the unprejudiced onlooker, it sometimes seems as if the rich were often unjustly criticised and generally maligned; and, if they will find it hard to enter the kingdom of heaven, I sometimes think, and even hope, that their spiteful and envious detractors will not find the needle's eye quite as accessible as they imagine. For, after all, there is no more particular merit in being poor than in being rich, and most of us would be very pleased to accept a far larger store in this world, if we could get it by hook or by crook, for money is always very pleasant to handle and very useful, and the wheels of life go much more easily for being oiled.

If it is true, as we are so fond of quoting, that it is the giver and not the gift that counts, it seems only reasonable to suppose that it does not really detract from the value of a present if the giver happens to be rich. The same love and care may have gone to its purchase as to the smaller offerings of poorer men, and it seems rather ungenerous to accept it with a sniff—even if it is a secret sniff—or with the disparaging thought, 'He can afford it.'

It is, I think, a mistaken idea, but quite a common one, that there is no real generosity in a gift for which the giver has himself no further use, no matter what it may be; but things old in themselves, or out of date, or even damaged have often a long life in another circle, not necessarily a lower one; and if the selection is made with a real understanding of the need of those to be helped—if the right thing is given at the right moment, with real kindness—it is difficult to see why the recipient should not be grateful and gracious too. But, alas! rich or poor, I think we all find it more difficult to receive graciously than to give.

People of small means do not, as a rule, give away what they really need themselves, even in their most generous moods, and it seems rather absurd that they should expect their richer friends to do so. What is sauce for the goose is sauce for the gander; and, in *all* cases, it is, or it ought to be, the giver who counts, and not the gift.

 [*All Rights Reserved.*]

So the poor rich seem to be always more or less between the devil and the deep sea. If they carry generosity to what is, in their case, quite legitimate excess they are spoken of as spendthrifts; if they display the most ordinary prudence or forethought they are accused of being mean. The case of the young man who had great possessions is a very real comfort to some otherwise quite kind-hearted people, though it is possible that it was the 'Follow Me' that was the stumbling-block, and not the selling all and giving to the poor.

There is one very certain thing in an uncertain world, and that is that whatever may be the intrinsic value of a gift, it is the love which lies behind the giving that marks its real price. What *always* counts is the giver, and it is a small mind that makes any distinction in such cases between wealth and poverty. At the bar of a justice more clear-sighted than ours, rich and poor will be judged alike. All that will go into the scales will be love and consideration, generous hopes and eager desires; and perhaps we shall be surprised to find how nearly the generosity of the rich will equal the generosity of the poor.

THE CAHUSAC MYSTERY.

CHAPTER XIX.—'ASTORETH.'

PUYFOT felt that he had been groping about for an eternity in some dank, dark, underground passage, and had at last broken free into a radiance of sunshine that exalted, blinded, glorified.

Those wonderful days began with the rare element of a surprise which included both good news and hope, and this after a period of profound dejection. But it did not stop there. He crossed to London on the summons—which included a generous cheque for travelling expenses—of the unknown patroness who had heard of his *Astoreth*, to find that city of dismal memories and gloom and rain transfigured. Puyfot was a man who knew his own special London well, that part which comprises the purlieus of Leicester Square. But now London was no longer the region of hunger and suspicion and dreariness; it met him with a summer-time of alternate sunshine and shadow such as his strenuous life had never known, sunshine in the warm glare of its parks, sunshine along the streets which led him on many days to a still square where a sharp line of shade upon the pavement marked his passing into cool shadows—or, to use sober words, Lady Madesson's house stood on the north side — through which, as through a vestibule, he entered into a dim, flower-scented room of which he never gathered any definite idea, for to his perception it had nothing earthly about it, nothing he had felt or known before. It was the haven of his dreams.

Vile as he was, in spite of his misapplication of his powers he remained the poet whose soul yearned for the stars. Intoxicated with a wild love, he yet looked upon Lorrie through purged eyes. She appealed to all that was highest and purest in him. Even ambition in its individual sense dropped away from him in those days of exultation. He was strengthened, cleansed, uplifted; he brought this wondrous mood to bear upon his *Astoreth*, and in scattered last touches made it what it is to-day—supreme.

This man, whose lacerated ambitions had in turn possessed and maddened him, their clamour always in his ears, eating into his brain and burning in his heart, beheld at the end of years of unhallowed drudgery the horned, deceptive, all-transfiguring moon of hope climb out of the wrack and murk of his squalid obscurity.

Lorrie was not to him what she was to Cahusac. Puyfot was a poet, and loved as one; he endowed her with a thousand poignant qualities, a thousand attributes for worship. He took her money, hoping one day to aspire to herself. He felt no sense of unworthiness, for was not his work to be her glorification? He dedicated to her his *Astoreth*, that lurid and elemental transcript of humanity loaded equally with art and truth. By so doing he felt he was giving her immortality!

She, on her side, had shown him a new side of life. She followed him in his highest dreams easily, fully, comprehendingly. There was no star in the dark of unsoared heights whose sparkle she could not discern.

Yet the man's condition of mind was pitiable. He did not deceive himself in thinking that his reputation was unknown to her; he only deceived himself as to the motive that led her to interest herself in him. He believed that she saw him not as a collector of garbage for the Paris press. Ah no! she could see through and beyond that; to her he was the genius, the man of thought and boundless potentialities. He was not a fool, but essentially a genius of a well-recognised variety; his vanity, hardened by a colossal impertinence, was ingrown.

He reviewed his capabilities, and was pleased with the result. He knew himself to be far above the common herd. But for chance and the devil he might long ago have reached a pinnacle of fame to which De Sarsan, with his all-infernal luck, could never attain.

It was an evening at dusk, the room cool, summery the air, flower-laden and thrilling with that suggestion of ease and culture which was the atmosphere Puyfot loved to breathe. On his

way thither, as he strolled along the streets, he had been telling himself a tale of hope; now in Lady Madesson's presence he was almost too agitated to do himself justice.

Suddenly she began to speak of his struggles, his ambitions so long baffled, the unworthy work thrust upon him by his needs, of his many disappointments.

The creature of spurts and visions took fire. 'Madame,' he cried, 'I have known all this, I have suffered all this, I have stooped to all this! I have been through Hades! But when the Fates cast my destiny they ordained for me those years of misery. Had your noble kindness found me earlier in my life, to what heights should I already have risen!'

Lady Madesson's voice murmured sympathetically.

His thoughts amplified and intensified her words; a sudden hope choked him; his strange eyes blazed across the dimness of the room. It may be that Lady Madesson understood at that moment the manner of spirit she was raising.

'Yet I would not order my lot otherwise if I could!' he pursued in rising excitement. 'I have known a prolonged anguish; but the fact that I owe my present happiness and hopes to your hand repays me for all the past.'

But Lorrie never lost control of the situation; she faced it with a composure that could calm storms. Turn a man to talk of himself, and most difficult moments can be smoothed over. 'Tell me more of your sufferings, your struggles. What were they? How did you endure them for so long?'

He succumbed to the temptation. It is the red rag which a man will nearly always follow, forsaking his real aim and object for its delusive flutter. 'I have been in the mire. I offer no excuses. I had genius. It was necessary that I should live. You comprehend all when you comprehend this. You can sympathise; your eyes are unclouded; you can see! Had I had talent only I should have stood high enough by this time. Look at De Sarsan—great, rich, endowed with the power of keeping others down! Yet he has no spark of the true fire.'

'And your tragedy? How did you write your tragedy?'

'By living one!'

'If you had been well-to-do and happy would your *Astoreth* ever have been written?' she asked quickly.

'But yes, of a surety! It is beautiful to talk of a garret; but more good work has died in garrets than ever came out of them. Had I had money a hundred actors would have been crying out for my tragedy. If the world can see no reason why one should write save that one is driven by the force and prompting of genius, it despises the work. It assesses a man at his purse's valuation, and at no other. See you'—— He stood up in his excitement and raised his hands and shook them. 'Imagine, madame, if before you sent for me, before my *Astoreth* had become known, I had died!'—he almost sobbed as he confronted this sinister thought—'imagine what the world would have lost, irrecoverably lost! Imagine it, madame!'

'A loss indeed!'

'Had I written *feuilletons*,' he resumed more calmly, 'I should now have been prosperous, popular. But all these things I threw aside for Art. And how has Art repaid me? What have I been until to-day? A hawker of despised wares! My great drama thrust back upon me by men who would sift the dust in the streets for scraps of offal!' His voice rose again.

'But that day is past,' she said. '*Astoreth* will give you fame.'

'Madame, I have outraged every noble instinct to hold my soul still within my body until my child—the agonised offspring of my soul—should be breathed upon and live! You, lady, are the goddess whose breath has infused vitality into those dead limbs. Imagine the future! Figure to yourself *Astoreth* when she moves and speaks and enthrals the world! At once I shall rise to the serenity which lies beyond the reach of critics. I am already writing the story of my struggles. The papers will repeat much, and unborn biographers write of Ulpien Puyfot—and of you, madame! Our names shall be handed down together—the man who created, the woman who discovered!'

'No,' she said in an even tone, 'I did not discover you. You have never asked me that question. I should never have known of you had not some one who heard you declaim *Astoreth* told me of you!' She smiled. Here was her first move towards the end she desired to attain.

Puyfot stared at her. The thought that some human being intervened between the two whom he had just designated as creator and discoverer jarred upon his frenzy. 'I have not given it a thought, madame. What does it matter?'

'The connecting-link should not be forgotten in so illustrious a chain,' she replied gravely. 'You owe more to him than to me.'

'Does he want my gratitude?' snarled Puyfot with a quick change of tone. 'He could have won it years ago had he desired. He has kept me down from my youth. Madame, I cannot tell you how dark a shadow he has thrown upon my life. Gratitude! No; to you alone I am grateful! Let him be; he is full of success and wealth and selfish enjoyments. I have no gratitude for him!'

'But you speak of knowing him well, of owing him many of your disappointments. Whom are you thinking of?'

'Of De Sarsan!' He almost spat out the name.

She bent forward, shaking her head, with one of her rarest smiles, her face lit with the pleasure of speaking of the man she loved. 'Oh

no, not Monsieur de Sarsan! You have seen your real friend but once in your life. And he owes you no kindness—far from it—for you have deeply wronged him; you have injured him more than De Sarsan has injured you!'

Puyfot was utterly taken aback. 'Madame, it is impossible!' he exclaimed.

'You have called yourself unfortunate,' she went on in a tone that arrested him; 'but your friend, the best you have ever known, is even more so. You have assailed him with slanders and calumny; you have called upon the world to aid you in hunting him down. Yet he is blameless; his whole life has been blameless! His father was murdered years ago—he died for his country as truly as if he had fallen in battle—yet you drew an inference of infamy from that death with which to hurt the son. Oh, you have indeed been pitiless!'

Puyfot's wizened face shrank together under her reproaches uttered in the voice of velvet that he adored. 'I, madame—I?'

'Do not deny it to me, monsieur, for I know,' rejoined Lorrie sadly. She had drawn her bow at a venture, but the shot told.

'Is it, then, Monsieur Malcolm Cahusac of whom you speak?' Puyfot asked. He admitted her accusation without shame. 'Was it he who told you of me—of *Astoreth?* Why, yes, I can remember! I was pronouncing the human lover's appeal to Astoreth when he entered my room. He praised them as great lines! Yet, madame, the next moment his mouth was full of threats!'

'But naturally!' she retorted, borrowing his own French mode of expression. 'You have also been injured. Is your mouth full of blessings?' She was working upon his mood with every word she spoke.

He began eagerly in self-defence. 'Madame, I personally had no malicious intentions towards him! I injured him, perhaps; yes, but we who live as I have lived think little of rumours of this kind!' He snapped his fingers.

'That may be so, but you know that it is far otherwise in England. You are well aware that such accusations are not lightly regarded here,' she said with some indignation.

'I do not deny it. Yet, in truth, I gave no thought to that view of the matter. I have already explained to you that I considered myself bound to live by all means in my power for the sake of *Astoreth.* He appealed to me—I recall it now—yet I could do no other than refuse him. You will admit that?' he argued.

She looked at him with blue, unfathomable eyes. She pictured that interview, Malcolm's suffering pride and his despair, and she had no room for pity left towards Puyfot, although by nature she was very pitiful. But the most pitiful women are also women of the strongest natures, and they have in them a counter-strain of inexorable pitilessness. With those who are happiest this may never awake, its existence be never known even to themselves. Lorrie's life had been of the kind that develops the whole gamut of feeling, and at this moment she resolved to use her influence over Puyfot to the last remorseless limit. She would spare him in nothing. She realised the man's depravity, his rancour, his evil-mindedness, and her revulsion of feeling rose almost beyond her power to disguise—this dreamer in whose tainted blood genius and scurrility ran allied. She failed to see that the man carried in himself his assigned punishment.

'It may once have been necessary for you to submit to De Sarsan,' she said at last, trying to keep a failing hold upon her patience; 'but is it so any longer? Would it not be possible to set M. Cahusac right in the eyes of the world even now?'

'It is not my affair, madame; it is the affair of M. de Sarsan. Without him I can do nothing. I should not have told you so much, but I trust you as myself.'

'M. de Sarsan has no more power over you,' she urged. 'Use your independence, and do justice.'

Puyfot rose. 'Alas! I have not yet escaped the reach of his arm,' he replied despondently. 'I cannot explain, but'——

'You must tell me.'

'Some day, madame, perhaps some day, when *Astoreth* has claimed the hearing of the universe, and my thoughts are free, I would wish to tell you more of my history. It is a record of courage. At that time I will speak of De Sarsan and of this Cahusac. I shall then be of the great ones of the world myself. I have waited for many years. To-day the power is mine to make another man wait—M. Cahusac. Let him also learn what it means to wait—wait!'

(To be continued.)

THE WIZARD OF MODERN INVENTION: THOMAS A. EDISON.

By his Assistant, W. H. MEADOWCROFT.

THOMAS ALVA EDISON was born at Milan, Ohio, U.S.A., on 11th February 1847. His father came of Dutch stock, the ancestral Edisons in America having been descendants of millers on the Zuyder Zee, who emigrated to the United States about 1730, and settled in New Jersey. The family seems to have enjoyed a remarkable degree of longevity, for Mr Edison's father lived to the age of ninety-four, while his grandfather and great-grandfather lived until they attained one hundred and two and one hundred and four years of age respec-

tively. On the maternal side Mr Edison is of Scotch descent, his mother, before her marriage, having been Miss Nancy Elliott, daughter of the Rev. John Elliott, a Baptist minister, of an old Scotch family.

Even as a child of five or six years old, Edison showed a tendency to much originality of thought and an inclination to take interest in mechanics. On account of the assumed delicacy of his health he was not sent to school at so early an age as usual, and even then he attended only a short time. His teacher reported to the inspector that the boy was 'addled;' whereupon Mrs Edison indignantly removed him from school and undertook to educate him herself, she having formerly been a teacher in the High School. Under his mother's teaching and influence young Edison made good progress, and, besides receiving a sound education, acquired a taste for good reading.

At about ten or eleven years of age Edison became greatly interested in chemistry, and, having got some books on the subject, he persuaded his mother to allow him a space in her cellar for a laboratory. Here he experimented with such chemicals as he could procure with his limited pocket-money. He had gathered together about two hundred bottles of various sizes and shapes to contain his chemicals, and labelled them all with the word 'Poison,' so that they would not be disturbed.

Edison continued his chemical studies at home until he was between twelve and thirteen years old; and then, finding that his pocket-money was inadequate to purchase all the apparatus and chemicals he wanted, he persuaded his father and mother to allow him to become a railroad newsboy in order that he might earn money for his experiments. He received the necessary permission, and thus came to sell newspapers, magazines, candy, &c. on one of the trains of the Grand Trunk Railway running between Port Huron and Detroit. Part of a baggage-car was allowed him for his stock of goods, and into this space he moved his laboratory from home, and continued to experiment there, but on an enlarged scale. He also bought a printing-press and type, and published on the train a weekly newspaper which he called the *Weekly Herald*, of which he was proprietor, publisher, editor, compositor, pressman, and distributor. The paper contained local, market, and railway news, and had as many as four hundred subscribers at one time. As far as known, this was the first newspaper ever printed on a moving train, and by, probably, the youngest editor in the world.

Edison continued along these lines between two and three years, until one day a bottle containing phosphorus fell off a shelf and broke upon the floor. The phosphorus set fire to the car, which was with some difficulty rescued from burning; then the conductor put the boy and his belongings off the train, and boxed his ears so soundly as to cause the beginning of the deafness with which he has ever since been afflicted.

Some little time before this Edison had saved from death the child of a station-agent on the railway line, and the father, in gratitude, offered to teach the boy telegraphy. This offer was eagerly accepted, and since that time Edison has assiduously studied the art, besides continuing his chemical and other studies. He plunged into telegraphy with great enthusiasm, and worked as an operator in various telegraph-offices in different parts of the United States. Being able to do with but a very few hours of sleep, he worked nearly twenty hours per day, and not only continued his chemical studies, but also applied himself very closely to the study of electricity and the art of telegraphy.

After a little more than five years of this kind of life, during which time he was constantly studying and devising minor improvements, he invented a duplex system of telegraphy, which he tried to sell; but, through inefficiency and lack of honesty in his associates, failed to realise. Following some further adventures and hard work in Boston, he determined to try his fortunes in New York City.

Edison arrived in New York one morning in 1869, and on leaving the boat was entirely without money. In his extremity he walked the streets for part of the day, his only food being a little tea obtained from a tea-taster who was exercising his profession as Edison passed by. Later in the day he found a telegraph-operator, who lent him a dollar, with part of which more substantial food was purchased. He then made application for work to the Western Union Telegraph Company, and got permission to sleep in a battery-room of the Gold Indicator Company until he could get a position.

While waiting for a favourable reply to his application he spent his days in the operating-room of the Gold Indicator Company. About the third day after his arrival there was an accident to the central transmitting machine, which stopped all operations on about three hundred outside machines in customers' offices. Everything and everybody were in confusion instantly. Nobody knew what was the matter except Edison, who informed the president of the company that he could fix it. He was told to do so, and in about an hour or two everything was operating satisfactorily. Edison was asked if he would accept a position as superintendent at three hundred dollars a month.

This was the beginning of Edison's real inventive and commercial career. He stayed with the company for some time, made a great many improvements and inventions relating to stock-printers, and finally received forty thousand dollars for his inventions. Edison at this time was only twenty-two, and this large sum, which placed him in a position of pecuniary inde-

pendence, was the first money received from his inventions. With the money he opened a factory in Newark, New Jersey, equipped it with first-class machinery, and became a manufacturer of stock-tickers and other telegraph apparatus, employing over one hundred and fifty men. He continued this business for several years, during which time he perfected several other important inventions, such, for instance, as the automatic telegraph, by which over three thousand words per minute were sent between distant cities. This invention was worked successfully and commercially for upwards of two years, but was bought by Jay Gould for purposes of stock manipulation, and was put on the shelf.

It was during this period that Edison also invented the duplex and quadruplex telegraphs and the electromotograph. His well-known quadruplex made it possible for the first time to send commercially four messages, two in each direction, over one wire at the same moment, saving millions of dollars in line construction. The electromotograph was an invention made to order. An inventor named Page had obtained a patent covering the use of a relay and sounder, operated electro-mechanically through a rectractile spring. Such a patent at that time would have controlled the telegraph business. The Western Union Telegraph Company did not control the patent, and would have been obliged to close; but they laid the matter before Edison, who, availing himself of a previous discovery, invented a relay which operated entirely by electro-chemical decomposition, and thus opened a new and unsuspected line in the art entirely independent of the Page patent. For this invention Edison received one hundred thousand dollars.

During these busy years in Newark came the invention of the telephone by Bell. At that time Edison was working on harmonic telegraphs, and after Bell's telephone was announced and its limitations understood, Edison commenced to work on a separate and more commercially useful transmitter, and eventually invented the carbon transmitter, which has made the art of telephony commercially practicable, and has ever since been in universal use. He sold this invention also to the Western Union Company for one hundred thousand dollars.

In 1876 he moved from Newark to Menlo Park, New Jersey, giving up the manufacturing business, and making invention his life profession. Here for nearly two years he continued to invent telegraph and telephone apparatus and other devices. In the autumn of 1877 Edison startled the world by his invention of the phonograph. During that year he had also made his first attack on the electric light problem; but, beyond ascertaining some very important facts after a searching investigation, he had not advanced very far on that line.

The furor caused by the invention of the phonograph kept him very busy until the summer of 1878, when he was tired and took a trip to the Western States, remaining away two months. On returning home he again resumed his investigation of the electric light problem, and with a corps of faithful assistants worked with unremitting ardour and fierce energy day and night, reluctantly snatching a few minutes for meals and a very few hours for sleep, until, on 21st October 1879, he perfected the first incandescent lamp, with its fragile carbon filament *in vacuo*.

During all these months of work Edison had been developing not only a lamp but also an entire system of electric lighting, and now proceeded to perfect it. He had conceived a complete system of generating, distributing, regulating, and measuring electric current for light and power; but the whole scheme was so entirely novel that he was obliged to invent an enormous number of devices and details necessary to make the system effective. Not only was the perfection of these details requisite, but as the dynamo machine of those early days was very crude and unsuitable for a system of incandescent lighting, Edison was obliged to develop a new type having an efficiency at that time quite unknown. Edison's successful development of the electric railway in 1880–82 was largely based on his efficient dynamo. The principles of this type of dynamo have ever since remained in the system.

Then came the commercial and engineering exploitation of Edison's lighting system, to which he gave several years of time and effort day and night in the organisation, equipment, and operation of manufacturing shops, the construction and operation of the first and other early central stations, the inception and development of the isolated lighting-plant, and the perfecting of an innumerable host of technical details of a rapidly growing system.

This was one of the most intensely active periods of Edison's life. In the few years during which his energies were concentrated on commercial electric lighting problems—1880–87—he applied for and obtained more than four hundred United States patents.

In 1887 Edison moved to the new laboratory he had built at Orange, New Jersey. It had been a consuming desire in his mind for many years to build and equip a laboratory that should be the most complete of its kind in the world. His Menlo Park plant had been sufficiently equipped to serve for previous work; but now he had also an ambition to establish and operate a large industry in connection with which a completely equipped laboratory would be a central source of inspiration. Hence, after careful investigation, he had decided upon the Orange Valley as the place where he could put his ideas into execution.

Soon after settling in the new laboratory Edison took up the phonograph, which had lain practically dormant for ten years, and proceeded to make it commercially practicable. In a short time shops were equipped with machinery, and the commercial exploitation of the phonograph was begun. In about three years he had applied for eighty-two patents on the improved phonograph and its parts. During this time its commercial exploitation had gone on apace and created an extensive market. This subsequently increased so greatly in magnitude as to require the construction of five large concrete buildings and the employment of several thousand people.

In 1891 Edison's versatile mind was busied in many directions. He invented new types of generators and motors, also a number of improvements relating to electric lighting and to electric railways. In this year he also commenced work on an undertaking that was monumental in character, involving the magnetic separation of lean iron ores, of which further mention will be made below.

The year 1891, however, witnessed an invention whose influence has been profound and world-wide. We refer to Edison's basic patent covering apparatus for the taking of motion pictures. The application was signed by him on 31st July 1891, and the patent was issued some time afterwards. This invention has been adjudged to be fundamental in the art, and its principles are now in extended use all over the world in the production of motion pictures, affording interest, amusement, and instruction to millions of people.

The succeeding nine years of Edison's life were mostly devoted to the prosecution of the gigantic undertaking above referred to. To supplement the scarcity of iron ore in the eastern part of the country he proposed to crush bodies of lean ore carrying magnetic iron, separate the iron magnetically from the gangue, and sell the concentrates to the furnaces. In order to accomplish this he planned to reduce mountains to dust, pass this finely divided material through sieves, dryers, and magnetic separators, and finally to press the concentrate into briquettes as a convenient form for the furnace.

This tremendous project called forth some of Edison's most brilliant inventive and engineering efforts. At every step there arose new and unprecedented difficulties, which were met and surmounted successfully one by one. In solving these problems many important inventions were made, and Edison took out over fifty patents covering them. Space is too limited to enumerate these inventions; but one is entitled to special mention—namely, the apparatus called the 'giant rolls,' by means of which masses of rock each weighing as much as ten tons were reduced to fragments in a few seconds.

Unfortunately the story does not end well, for after nine years of hard work, when Edison had succeeded in bringing his project to the point of financial and physical success, there came the discovery of the Mesaba range of iron ore, where phenomenally rich ore could be scooped up with a steam-shovel. This could be shipped and sold for little more than one-half the price at which Edison could sell his concentrated ore, of course rendering his enterprise commercially impossible, and he was reluctantly obliged to cease after spending nine years of his time and over two million dollars of his money.

Undaunted, however, Edison returned to his laboratory at Orange with the avowed intention of inventing a new type of storage battery which would employ neither lead nor sulphuric acid. Working for many months without any encouraging results, he at length obtained reactions that opened the way to ultimate success. Thus there commenced another period of inventive activity, which continued over many years. With a band of chosen associates, Edison brought to bear on this problem his fierce, concentrated energy that carried the work on through several years of unceasing toil. The ultimate outcome was the now well-known form of Edison storage battery, with nickel and iron elements, and an alkaline solution for electrolyte, all being enclosed in nickeled steel containers. Edison's great work on his storage battery was done in the first five years of the twentieth century, and it may here be remarked that his object was to produce a battery that should be suitable for automobiles and for trucking and hauling, and also to supersede the trolley as a means of propelling street-cars. By the summer of 1911 the battery was in use on thirteen street-cars and on more than one thousand two hundred trucks. The demand is increasing by leaps and bounds, and about a thousand men are employed in two shifts making the batteries.

Arising out of his great work in the separation of iron ore above mentioned is another Edison enterprise which has been enriched by his persistent efforts and inventive genius. We refer to his extensive plant for making Portland cement. When he was forced to abandon the concentrated iron ore business, he was of opinion that it would be a pity to lose the great experience gained in breaking and crushing rocks and the handling of vast quantities of finely divided materials. He therefore determined to utilise it by going into the Portland cement business.

The cement industry has been enriched by many of Edison's inventions, especially his 'long kiln,' used for 'burning' the mixture of cement material. His company is already the fifth largest producer of cement in the United States.

One of Edison's later inventions involves the use of cement in the construction of cheap and indestructible homes for working-men. His scheme is unique in that it contemplates the construction of a complete house in one operation, from cellar floor to tip of chimney, in a few hours.

The plan is to provide two sets of iron moulds, one set within the other, at a certain distance apart, and to pour into the space a continuous stream of a specially invented free-flowing concrete mixture. This fills all the space between the moulds. In a few days, after the concrete has hardened, the moulds are taken away, leaving a complete house, indestructible, fireproof, and vermin-proof, and needing only doors, windows, and lighting and heating fixtures to make it ready for habitation.

From 1869 to the present time he has filed more than one thousand four hundred applications for patents; and, in addition, over one thousand five hundred other inventions are embraced in one hundred and twenty caveats filed by him during these years. These and some other inventions are also covered by one thousand two hundred and thirty-nine patents issued to him by foreign Governments.

When one considers the practical value of Edison's inventions as a world asset the tremendous force of his personality is apparent, for it has been one of the most potent factors in bringing into existence many entirely new arts and industries, and in contributing very largely to others, all of which are now capitalised in America at seven thousand million dollars, earning annually over a thousand million dollars, and giving employment to an army of more than six hundred thousand people. Not that Edison has brought these arts and industries to their present magnificent proportions; but he is the father of a number of them; and as to some of the others, it was the magic of his touch that helped to make them practicable.

THE WRATH OF ISHMAEL GOUDIE.

CHAPTER VI.—FOUL MURDER.

WHEN the butter had been distributed among the regular customers Mirren Dawson did not hasten back to the Hainings. It was her pleasant habit, when she delivered the last of the butter—which was the half-pound taken weekly by Miss Peebles the dressmaker—to sit down and have a cup of tea and a little mild gossip with the recipient; and although this afternoon her visit was paid in advance of the usual time, Miss Peebles welcomed her friend warmly, and, insisting on her coming in, hurried to put on the kettle and to lay the cloth.

Mirren had been up early, so she felt glad to sit down in the comfortable high-backed armchair in the tidy kitchen, and enjoy a relaxation that she knew was well deserved.

Robina Peebles was the only one of the villagers with whom Mirren was intimate. She was a tall, fair woman of indefinite age. After serving an apprenticeship to dressmaking in Edinburgh she had returned to Pittendrevie, and settled down with her parents in the little red-tiled cottage that had been built by her thrifty father. There she practised her art, fashioning gowns for the village folk, and occasionally being entrusted with the remodelling of a dress for the minister's wife.

Since the death, two years before, of her last surviving parent, Miss Peebles had lived alone, holding herself a little aloof from the ordinary residents in Pittendrevie, and preserving both in deportment and appearance an impressive atmosphere of gentility.

Robina Peebles was discreet. She kept her own counsel. Her highly burnished reputation had never been tarnished by the slightest breath of scandal. Speaking confidentially to Mirren, she had once referred to her own character as being as unblemished as a clean sheet of notepaper. Of a certainty no man had written his name across that blank page. So in the tiny agricultural village, where the standard of morality did not by any means reach the highest level, Miss Peebles's good report was one to be envied. For the rest, she looked much as she had done at any time during the last ten years. The general effect she gave was of a drab uniformity of colouring. Her hair was drab, her complexion sallow from being so much indoors, and in selecting her garments she inclined to neutral shades. She was genteel, with the gentility that sits in the back pew in church, wears a black silk apron in the afternoons, and never goes out without first putting on gloves, though on week-days these gloves may be of the cheapest cotton.

Shrewd Mirren Dawson suspected her friend of cherishing a secret liking for Ishmael Goudie; but when she attempted to rally Ishmael on the subject, he was so sincerely astonished that Mirren saw that, whatever the spinster's hidden predilections might be, the thought of her as a possible sweetheart had assuredly never crossed Ishmael's mind. Apart from the disparity in their ages—he was thirty-one, Robina nearly forty—Ishmael was too engrossed by the involved affairs of the farm to have either inclination or leisure for dalliance.

'And how are they all at the Hainings?' Robina asked politely, as she refilled the teacups. 'I hope the old gentleman is a little better?'

'Oh, Robina woman, things at the farm are in an awfu' state!' A haunting sense of uneasiness, and the certainty of sympathy, urged Mirren to unusual confidence. 'I was thankfu' to get oot o' the hoose the day. Walter was in a terrible randan, goin' on at Ishmael, ca'in' him for every-

thing because he wouldna gi'e him mair money to squander. An' the doited old body sittin' by the fireside sniggerin' an' laughin'! 'Deed, I wondered how Ishmael stood it. But he 'll no aye stand it,' she added with fine prescience. 'Ishmael 's real forbearin', but even a worm 'll turn.'

'I 'm afraid Mr Walter does not do justice to his opportunities,' Robina said, shaking her head gravely. 'I saw him with his gun walking past the parlour window this forenoon. He seems to leave the burden of the work to Mr Ishmael.'

'Ay, it 's the willin' horse that gets the maist wark. If it wasna for Ishmael an' me things at the Hainings would go a' to pieces. An' him that lame wi' a hurt knee, too! But toil an' scrimp as we like—me inside the house, an' Ishmael outbye—the money we save jist runs like sand through Wattie's fingers. I 'm speakin' plainly, Robina, but I ken wi' you it 'll go nae farther.'

'You know your confidence is sacred with me, Mirren. But what was it you were saying about Mr Ishmael's knee? I never heard he had injured it.'

'It was a young horse kicked him. But I 'll tell ye a' aboot it as we gang up the road. I feel as if I shouldna be lingerin' here.'

Following her custom at the conclusion of these weekly visits, Miss Peebles put on her hat and gloves, and escorted her friend part of the way home.

The cottage was the last house in the village street. Beyond it the road sloped gradually eastwards to where the farm buildings topped the brae. There was no chance to-night of Ishmael's being at work within sight; but Miss Peebles was careful to follow her usual procedure exactly, so that Mirren might have no grounds for thinking that she only accompanied her when there was likely to be opportunity of seeing him.

By the stone dike half-way up the hill they paused to say good-bye. It was a sweet, mild evening in early spring. From the village came the happy clamour of children just released from school. The hedges were beginning to bud. By the roadside a few cowslips were blooming. Excited birds were busy house-building, and down by the 'laigh field' Forgan and Leezie the servant lass were hard at work, moving like automatons across the dark earth, just as Mirren had seen them two hours earlier when she left the house.

A faint thread of smoke still soared aloft from the kitchen chimney when Mirren, walking quickly to make up for lost time, neared the house. There was a cheerful clucking of poultry about the farmyard. But as Mirren got nearer an unpleasantly familiar odour assailed her nostrils, making her hasten her steps, her face wrinkled with anticipatory annoyance, for her educated sense of smell warned her that a pot was burning on the fire.

'Men folk 's a' alike,' she told herself impatiently. 'Ye may run yersel' aff yer feet for them, but they 'd sit an' see the bottom burn oot o' a pan before they 'd put forrit a hand to lift it to a side.'

Hastening on, she reached the back-door. To her surprise, it was shut. On the doorstep a child's coarse woollen stocking was lying. With an impatient thought respecting Janet Forgan's feckless ways, Mirren kicked it aside, and hurried in to rescue the burning pot.

The atmosphere of the familiar room seemed to have changed; through a vapour that hung heavy in the air she saw that John Goudie sat in his accustomed chair by the fire, on which the pot was burning.

'What way did naebody lift aff the pot?' she demanded, setting down her empty basket on the dresser. 'I smelt it far doon the road. It 'll be ruined by this time.'

She had left John Goudie laughing. He was laughing still, but she saw that the old man, his face distorted with horror, was gazing down at something that the intervening bulk of the table hid from her. And as he gazed he laughed.

A moment later she was out in the yard with a blanched face and a tongue that refused to articulate, skirling helplessly for aid.

When assistance came and the house was re-entered, it was to find the body of young Walter Goudie lying huddled on the kitchen floor, in full view of his father, who had subsided in an inert heap in his arm-chair, death-stricken by another paralytic seizure.

A faint odour of gunpowder hung on the air. On the sofa was Walter's new gun, as though the murderer had thrown it down in his haste to escape.

John Goudie would never speak intelligibly again. The one person who could have told what had happened in the farm-kitchen during that afternoon hour was Ishmael, and of him there was no sign.

Under ordinary circumstances the Hainings might have been accounted out of the way; yet within an incredibly brief space the report that the adopted child of the farmer had murdered his only son had flown like wildfire over the countryside. The baker, who had driven up in time to enter the house of death with Forgan, savoured the bread he proceeded to deliver at the outlying hamlets and farms with the tragic story. Forgan's eldest boy, who arrived back from school just in time to gallop to Braeside for the policeman and the doctor, spread the news as he went.

Once within the house, the representative of the law reigned supreme. At his instigation a bed was hastily set up for John Goudie in the dining-room, where he had so often caroused, and thither the old man was carried, to linger a

day or two, his living eyes set in a dead body speaking dumb appeal to the curious observers before their light was quenched for ever.

From that time and for many days to come the interest of the community centred on the lonely farm.

For the first time in her career Mirren Dawson was the one round whom special interest circled. She had been the last person to see young Goudie alive, the first to see him dead. And she had been witness to the black blood that surged between the murdered man and his mother's adopted son.

Public opinion had jumped to the conclusion that Ishmael had committed the murder. But Ishmael had disappeared. The result to be attained was his arrest. Aided by the knowledge that he was handicapped by a badly injured knee, public opinion was unanimous in deciding that his capture was a matter of minutes. There was scant cover about the farm, and the hedges were still scarcely flecked with green. With Leezie and him at work in the 'laigh field,' it was impossible for a cat to have left the farm unseen, Forgan asserted.

After exhaustive questionings, and the taking of extensive notes—which he afterwards was unable to decipher—in a greasy pocket-book, Constable Webster delivered himself of the opinion that, as it was clearly beyond his physical ability to get away, Ishmael must still be in hiding either about the house itself or in some of the outbuildings, awaiting a chance of escape.

While it was yet daylight the search was begun. The discovery of the tumbled state of Ishmael's room, of the box whose contents had been emptied on the floor, seemed to point at hasty preparations for flight. Yet no clothes were amissing. Even his savings-bank book lay where Walter Goudie had contemptuously cast it when he discovered that most of Ishmael's poor earnings had gone to try to save the farm from ruin.

Having assured himself that the man he sought was not in the house, Constable Webster, whom the untoward event of the afternoon had transformed from an apparent idler into a power holding almost the keys of life and death, marched ponderously downstairs, and announced his intention of searching the barns and outhouses.

By this time work for the day was over, and all the able-bodied men in the parish had gathered at the Hainings, ready to hunt down the murderer, against whom indignant feeling already ran high. Half-a-dozen of the most daring, who had armed themselves with such farm implements as came handy, attended the officer, while the less venturesome formed themselves into a cordon and surrounded the farm buildings.

The search was a thorough one. In the hayloft and stable—where the neglected horse greeted the invaders with a whinny of pain—not a truss of hay was left unturned. Ishmael was a tall man, but not a corner that a child might have wormed its way into was overlooked. Still, even the most careful scrutiny failed to reveal trace of the wanted man.

'If I had jist thocht to take notice o' what the bairn was tryin' to tell me!' Mrs Forgan said, half-regretfully, half-proudly. 'His meanin' would ha'e been as plain as print if I'd jist had the gumption to understand him. He had been up to the hoose for sour-milk, an' he cam' hame greetin' wi' the empty can. If I'd jist kent to gang up an' speir what had vexed the bairn, I'se warrant I'd ha'e seen the hale affair.'

'Ay, an' ye'd maybe have got a clour in the bygaun, or maybe a wheen shot in yer skin. I'm thinkin' ye were best whaur ye were, my woman,' argued her cautious husband.

Before dark a reinforcement of police had arrived from the county town, and Webster's brief authority had yielded to that of a superior officer.

All night long timorous villagers looking up to where the farmhouse topped the brae might have seen lights shining in the windows. One burned where the old man lay slowly dying. Another dimly illumined the bedroom overhead, where young Goudie's body rested on the bed on which he had been born—the room where Ishmael first saw the infant features of the man he was doomed to slay.

In the big kitchen watch was kept all through the dark hours. The teapot stood on the hob; scones and oatcakes were on the table. Mirren Dawson—who secretly regarded as a special dispensation of Providence the fact that she had churned that morning and baked the day before, so that the house was well provisioned—gossiped and dozed, and dozed and gossiped, repeating a hundred times the tale of that supreme moment when she came in out of the sunlight: 'An' me wi' the empty basket in my hand, an' thinkin' aboot nothing, but jist that Ishmael had left the big pot to boil itself dry on the fire! An' then to see puir Wattie lyin' there! Oh, the thocht makes me grue yet! It was a sicht I'll see to my dyin' day. I ken I will!'

CHAPTER VII.—A CRIMINAL AT LARGE.

FOR many weeks the murder at the Hainings was the talk of the countryside.

Three days after his son met a violent end John Goudie died, taking to the grave with him the secret of what had occurred in the farm-kitchen between the time that Ishmael had put out the ploughman's half-witted boy and Mirren Dawson's return from Pittendrevie.

One person alone knew, and he had disappeared as completely as though the earth had opened and swallowed him up. Ishmael's few

personal belongings were all at the farm. His shoes lay beside the couch on which Mirren had left him resting; his cap still hung on its peg at the back of the kitchen-door. Wherever Ishmael Goudie had sought refuge, he had gone shoeless and with uncovered head.

Dr Mickle, who knew the extent of the injury to his knee, refused credence to the supposition that in his state of suffering the fugitive could have travelled half a mile. 'Why, the thing 's an impossibility,' he declared. 'The knee was in a high state of inflammation. The slightest movement put the man in agony. I don't know yet how he managed even to get downstairs.'

The theory that a lift from some passing vehicle might have enabled the murderer to leave the district was quickly disposed of by the fact that, with the exception of the baker's van, no conveyance had passed along the road during the time in question.

It was curious to note how swiftly public opinion, which up to the time of the murder had been united in denouncing the loose ways of John Goudie and his son, had completely veered round in their favour. Now that they were dead the coarse brutality of their lives was forgotten.

Meanwhile the knowledge that the murderer was still at large sent an uneasy feeling through the district. Even in distant parishes mothers watched eagerly for the return of their bairns from school, and breathed a sigh of relief when their cottage doors were bolted for the night with their fledglings safe inside. Every man within a radius of miles became an amateur detective. Keen eyes examined each possible place of concealment, but without discovering the smallest trace of the runaway.

A positive thrill of relief went through the community when news came that a lame man had been arrested at Dundee on suspicion of being the Pittendrevie murderer. But, to the disappointment of the parish, the suspect was released on proving to be some luckless tramp who was suffering from a badly blistered heel.

Acting on behalf of the creditors, Cope, the neighbouring farmer, undertook, with the aid of Forgan, to complete the season's cropping of the fields. The farm-stock and household plenishing were sold by public auction, and during one long glorious July day the Hainings farm became a place of pilgrimage.

But when that gala-day of comment and competition was over, a sinister aspect seemed to enfold the empty dwelling and the deserted steading. Mirren Dawson had long ago returned to Edinburgh, where she was keeping house for a widowed brother; and in the autumn Forgan feed with a farmer from beyond Cupar.

No one rented the farm. The landlord declined to reduce the rent to an extent sufficiently tempting to induce offers, and it was well known that the heedless Goudie had starved the soil.

So the house that for so many years had been a home was deserted, and the once productive land lay fallow. The garden, in whose culture Mrs Goudie had taken so much pleasure, was allowed to run wild. The place speedily assumed a desolate appearance, and by the time the crops had been garnered timid children would rather go a long way round than pass the farm at dusk.

. . . . . .

One clammy day near the end of November, Mirren Dawson travelled from Edinburgh to visit her friend Miss Peebles at Pittendrevie. Though she had sent no forewarning of her coming, Mirren's reason for taking the journey was a special one. So confidential was its nature that she refused to trust it to the post; though it must be admitted that, apart from her vague distrust of the local representatives of the Government, Mirren was no scribe. As she was wont to say, 'I never was a letter-writer;' thereby seeming to imply that she was everything else.

The routine of Robina Peebles's daily life was seldom varied. Mirren felt almost certain to find her friend at home, and she was confident of receiving a warm welcome.

When she changed into the East Fife train at Thornton Junction, Mirren found herself in company with Mrs Maconochie, who was the gossip and mischief-maker in chief of Pittendrevie; and though Mirren's healthy interest in her fellows rendered her humanly susceptible to the pleasures of a 'crack,' she felt that in company with Mrs Maconochie it behoved her to walk warily.

'Ay, ye 'll find things sair changed at the Hainings,' Mrs Maconochie said unctuously, as though she derived a melancholy gratification from the fact. 'It 's a terrible sad thing to see the hoose cocked up there on the brae, an' no' a livin' creature near it, an' the windows starin' that black an' dismal-like at ye.'

'Ay, woman, it 's changed days noo at the Hainings,' Mirren made non-committal reply.

'An' there 's never a word been heard tell o' Ishmael Goudie! I often wonner where he 's gotten to. My man aye says he 's sure that when Ishmael found what he 'd done he louped into the loch an' was drooned. But Dan Forgan telt him that that was a stark impossibeelity; for if Ishmael had sae much as set fit doon the brae-face, him an' Leezie Kerr would ha'e seen him, for they were workin' in the laigh field.'

'An', forbye, the loch-water 's that shallow till ye gang far in that he 'd have had to wade a long way oot. No, no. Wherever Ishmael Goudie is, it 's no' in the loch.'

'Are ye makin' a long stay?'

'Oh, maybe a day or twa.'

'Ye 'll be for stoppin' wi' Robina Peebles?' Mrs Maconochie hazarded. And when Mirren

had acknowledged that her conjecture was a correct one she heaved a sigh as of commiseration. 'Ye havena seen Robina Peebles sin' ye left the Hainings, I'm thinkin'? Ay'—a solemn shake of the head made the bugles on Mrs Maconochie's bonnet jingle—'I'm afraid ye'll find a change in Robina.'

'A change! Whatna way is Robina changed?'

'Oh, she's turned that parteecular noo, she'll scarcely speak to a body'——

'But Robina was aye parteecular. She aye kept hersel' to hersel'. If it's jist stand-offishness ye mean'——

With a scornful sniff Mrs Maconochie interrupted Mirren Dawson's defence of her friend. 'Aweel, if Robina Peebles was parteecular afore, she's by-ordinar' parteecular noo. There's some folk that wouldna hesitate to ca' her *peculiar*.'

'Weel, she maybe kens her ain affairs best,' Mirren answered shortly. 'A'body has a richt to choose their ain friends. I'se warrant Robina'll no' steek the door against me. We were aye ower thick for that.'

Miss Peebles's cottage had the distinction of being on two floors. When the house was in process of building the conflict between her mother's desire for a two-story house and her father's reluctance to squander his hard-earned savings on feminine fancies had ended in the erection of a narrow cottage, which had two rooms, one placed behind the other on the ground floor. Above were a couple of attics; that to the front had a storm-window; the other, which was used as lumber-room, gleaned a faint light from a skylight set in the sloping roof.

After she had parted with her travelling companion at the west end of the village, Mirren did not encounter anybody she knew. The dampness kept the women indoors, and the children were still at their lessons. Mirren heard the concerted murmur of their voices as she passed the school.

A thin mist overhung the surface of the loch and blotted out the farmhouse, towards which Mirren cast an apprehensive glance. The atmospheric depression was so disheartening that she was sincerely glad when she reached the house where she meant to shelter for the night.

Seizing the brass knocker, she plied it to give due warning of her arrival, then turned the handle of the door, meaning to enter in her former unceremonious fashion. To her disappointment, the door proved to be locked. Robina might be out; yet if she were, the key had not been left in the outer keyhole, as was the custom in trustful Pittendrevie. As she again lifted the knocker loudly, Mirren noticed that, though formerly it had been Robina's pride to keep it highly polished, it was dull and tarnished, as though it had not been cleaned for days. Then she became conscious of movement within, though no one hastened to open to her.

'Deary me! Robina's surely an awfu' fidget, keepin' me standin' here in the damp jist because she's no' dressed or some sic havers.'

Then there came the unmistakable sound of footsteps, the key turned in the lock, and as the door opened the face of Robina Peebles, thin, pale, indefinite, appeared.

'Well, Robina, my woman, ye never expected to see me, did ye?' Mirren said, smiling broadly in anticipation of a warm welcome.

'Oh, it's you, is it, Mirren? I never expected to see you. And did I keep you waiting? I was out at the back feeding the hens.' In her haste to make excuse for the delay, Robina's words were tumbling over each other. 'Why did you not write you were coming? If you had just sent a scrape of a pen'——

'Hoots! ye ken fine I never was a letter-writer, Robina. But what are we makin' a wark aboot? I'm here, an' ye're at hame, an' surely that's a' richt?'

Mirren's tone had been rendered testy by the consciousness that moisture was dripping from the tiled roof on to the crown of her crape toque.

'Ye'll come in?' Robina's tone might be hesitating, but Mirren needed no second invitation.

''Deed will I that,' she said, and promptly stepped into the narrow entry.

'You would think it queer to find the door locked, Mirren; but there's been so many gaun-folk about lately that a body canna be too cautious. Come in here.'

In place of leading her guest to the cosy kitchen, Robina had opened the door of the parlour, a state apartment in which the infrequent customers were interviewed and had their garments 'fitted on.' Seen on a dismal November day, it was not an enticing room. Prim white curtains draped the window, which faced due north. A cascade of crinkled paper and tinsel coldly decorated the grate. The wall-bed acted as a cupboard in which the materials necessary to dressmaking were stored. The chill austerity of the place made Mirren shudder.

Leaving her guest alone, Robina had disappeared. Mirren heard her quietly relock the front-door before she hastened towards the kitchen.

'Take off your things and lay them on the top of the bed, and I'll run and blow up the fire,' Robina had directed, and Mirren had obeyed. But she had time to feel chilly without her warm cloak, and to put it on again, before her hostess came to fetch her.

A cheery fire was burning in the kitchen grate, and Mirren sank gratefully into the arm-chair that stood by the hearth. To her surprise, the window stood open, admitting an inrush of cold air, and affording a depressing view of the dead garden and of the mist-shrouded loch beyond.

'Ye've surely turned real keen on fresh air, Robina,' Mirren commented dryly; and, murmuring something about having opened the window

to let out the smell of the baking, her hostess hastened to shut it.

Though the appointments of the kitchen seemed unaltered, an indefinable change in the atmosphere puzzled Mirren. Robina looked pinched and older, yet there was a pleasant, homely air about the room. The only unfamiliar objects were the newspaper that lay on the window-sill and the big flour-barrel that stood in a corner.

'Jamieson's bread wasna very good in summer, so I got into the way of baking for myself,' Robina explained, indicating the fresh-baked three-cornered scones that stood on the dresser to cool.

It was not until their meal was half-over, and Robina had risen to fill up the teapot from the kettle on the hob, that Mirren felt rested and refreshed enough to disclose the reason of her visit. 'Ye 'll be wonderin' what brocht me here the day,' she began, speaking in an important undertone; 'but I had something special to tell ye. Robina — *I've found oot where Ishmael Goudie is!*'

'Stop—stop, woman! What are ye doin'?' she said a moment later, starting to her feet. For though Robina Peebles had not uttered a word of surprise in reply to the astounding communication, she had gone on pouring out the water, and from the overfilled teapot liquid was streaming down on her well-camstoned hearth and shining steel fender.

In former days Robina could not have rested until the mess had been cleaned up. Now, without even pausing to dry the fender, she set the brimming teapot on the clean tablecloth, and, sinking down in her chair, gazed with fixed eyes at her visitor.

'Yes, Robina, that 's what brocht me here. It was jist yesterday I had the letter, an' I didna ken what to do aboot it, for a thing o' that kind canna be concealed—the Guid Book warns us that murder will oot. It says the blood o' the murdered man cries oot frae the ground.' Mirren spoke solemnly. 'But wi' me bein' at the Hainings, an' seein' jist hoo things were, an' what terrible provocation puir Ishmael had, I didna like to gi'e information to the police, as maybe I should. Ay, it 's an awfu' responsibeelity. I scarcely slept a wink a' last nicht for thinkin' aboot it. Torn between two opinions I was, as ye micht say: whether I should inform the police—an' that would be a hangin' matter, ye ken—or let the puir wretch escape wi' his life. So I thocht I 'd come an' tell ye, Robina, for I kent ye were aye interested in Ishmael, an' in ony case the secret would be safe wi' ye. What do ye think I should do?'

Throughout Mirren's speech Robina had sat motionless. Her eyes were fixed on Mirren's face.

When Mirren paused for a reply Robina bent forward. 'Oh, dinna gi'e him up!' she breathed rather than spoke. 'Oh Mirren, for the love of God, think what he 's come through, an' him in sair agony wi' his bad knee, an' no' strong at the best! Oh Mirren, for the love of God, dinna tell on him! For the love of God'—— Her voice had trailed off into an inarticulate murmur. Her pale lips were twitching uncontrollably.

The reception of her news surprised Mirren. Though she had suspected her friend of harbouring a fancy for Ishmael Goudie, she had no idea of its being so deep-rooted as this agitation indicated.

'Weel, if ye feel like that, Robina, I must confess I agree wi' ye. An' I doot if I would ha'e done it in ony case. Of course I ken it would be the real conscientious thing to do to gang richt to the police; but as your opinion backs up my ain inclination, I 'll no' stir a fit in the matter. I 'll jist write back to my cousin in Canada, an' tell him that I dinna believe it could ha' been Ishmael Goudie he saw—that he must ha'e been mistaken.'

The expression in Robina's eyes had changed.

'Your cousin in Canada! Did you say in Canada?' she asked in an eager whisper. 'Oh Mirren, did you say somebody had seen Ishmael in Canada?'

'Yes. It was Donald Dawson. Did I no' say it was a letter frae him. Tits! I 'm a stupid woman. Here I 've been haverin' awa' an' never tellin' ye my news after a'. But I was that put aboot when I heard that ye must excuse me. Well, it 's nae farther back than jist yesterday that I had a letter frae my cousin Donald Dawson. Here it is. You 'll mind Donald went to settle in Canada twa-three years back? Weel, Donald had jist heard tell o' the murder at the Hainings, an' he said in his letter that he was certain that he had seen Ishmael Goudie at a place ca'ed Winnipeg. It was at a railway station, an' Donald's train was movin' oot, so he couldna get speakin' to him. But he was sure it was Ishmael Goudie a' the same. He hadna heard o' the murder then, for he had been rovin' aboot. He says Ishmael was wi' a lot o' men who were gaun up the country, "lumberin'" he ca's it. Ye 'll see it in the letter. Donald says he couldna be mistaken in thinkin' the man he saw was Ishmael, for he used to spend his holidays at the farm, an' he kent Ishmael Goudie fine.'

'Mirren'—Robina, her face alive again, was leaning eagerly across the table—'I 've been thinking it 'll no' do to let this pass. It 's ower serious a matter. You must tell them—tell the police—that you 've heard that Ishmael 's in Canada. You must give them the clue, an' set them looking for him in Canada.'

'Ay—Robina!' Words rarely failed Mirren Dawson; but at her friend's strange pronouncement she stared in blank amazement, scarcely crediting the witness of her ears.

'Yes, I see now I was wrong before. I

shouldna have advised you past it. It's your bounden duty to tell.'

'Deed, then, I don't think I will.' Mirren spoke with spirit.

'If you do what's right you'll go straight to the police in Edinburgh and show them that letter,' Robina said doggedly.

'It beats me what ye're so doon on Ishmael for!' said puzzled Mirren. 'A minute ago ye were a' for hidin' him. Now ye're every bit as keen to get him hanged. I'm sure I wonder at ye bein' sae hard-hearted, Robina Peebles. Ye ken fine Ishmael was never ane to do an ill-turn to a body. An' if he did kill Wattie Goudie, Wattie jist got the end he was shapin' for. For nae livin' man would have endured the twa o' them as long as Ishmael had.'

'If you don't, it'll be on your conscience till your dying day,' persisted Robina.

'Let it!' cried the valiant Mirren. 'It'll be a case o' an uneasy conscience onyway, I'm thinkin'. An' I'd a long sicht rather ha'e my conscience bother me for savin' a man's life than for helpin' to hunt him to death.'

'Oh, Mirren woman, you dinna understand—you dinna understand!' Robina cried piteously. Then she jumped up, and with a great show of energy began clearing the table, evidently quite oblivious of the fact that the meal had ended abruptly in the middle.

Mirren followed her movements with perplexed eyes. Vague notions were chasing each other across her active brain. 'Robina Peebles was aye a total abstainer; it canna be the drink,' she told herself, and failed to find a plausible explanation of the spinster's sudden change from a suppliant for mercy to one who bloodthirstily demanded the rigour of the law.

When Mrs Maconochie had spoken of Robina's peculiarity Mirren had scarcely listened. Now she saw many evidences of that lack of interest in her surroundings of which she had been warned. Though they had not met for many months, Robina had no local gossip to offer; and that her occupation of dressmaking had ceased to engross her attention was proved by the fact that the current number of the fashion magazine to which she was a regular subscriber lay unopened, still in its postal wrapper.

'Robina's ower much alone. It's no' good for her,' Mirren thought, remembering happily the trio of motherless children who were dependent on her own care. 'Nae woman should keep hersel' so select as Robina Peebles does.'

The oddest matter of all, and the most personally disturbing, was the discovery that her own presence at the cottage was unwelcome. Previous incidents had been annoying enough; but as the evening wore on it was a distinct shock to Mirren to hear Robina, who had been fidgeting nervously about the room, ask with very evident reluctance, 'Would you like to stop the night here, Mirren?'

That proved the last straw. Mirren's righteous indignation at the inhospitable and foolish question tinctured her reply. ''Deed, then, Robina Peebles, I wasna intendin' to do onything else. Ye ken fine there's nae train back to Edinburgh the nicht. Where did ye think I was goin' to sleep if I didna sleep here? At the Hainings?'

And before Mirren Dawson succumbed to sleep in the hastily cleared wall-bed in the cottage parlour she assured herself that it would be two wet days and a dry one before she troubled Robina Peebles with another visit.

(To be concluded.)

THE ROMANCE OF TOBACCO.

By Lieutenant-Colonel P. R. BAIRNSFATHER.

AT Cawdor Castle there is on an old carved mantelpiece the figure of a fox with a pipe (quite distinct) in his mouth. The mantelpiece is said to be of considerably earlier date than that of the introduction of tobacco into this country—a fact, if so it be, which must have struck many as passing strange.

When I was in India, and especially when travelling, as I often did, through many remote valleys of the Himalayas, and seeing everywhere there, as in India itself, the universal use of the 'soveraigne herbe,' locally grown too, and perhaps remembering Cawdor, great doubts would often arise as to the correctness of the accepted belief that the plant and the smoking habit in these far-off lands really came all the way from America. For, as is well known, it is not only throughout India that the custom has for long prevailed, but throughout the whole of the East—China, Japan, the Malay Archipelago, Persia, Afghanistan—in fact, in every country in Asia.

For the rest, what countries of the world have escaped? In sober truth, very few. The case of Europe requires no mention, practically the whole of Africa acknowledges the sway, Australasia is not behindhand, while of course the two Americas are saturated with the smoke; and, to cap all, a very remarkable case of peaceful penetration was brought to light only the other day, when a party of explorers in unknown New Guinea came across a primitive tribe, described as living in the Stone Age, who had certainly never seen a white man before, but who nevertheless were all smoking.

Truly, then, I think it may be said that no

commodity, be it of food, drink, or mere luxury, has established for itself such a universal vogue. Even wheat or other food-grain, salt, or sugar, must, I believe, give place, while such things as tea or coffee are, of course, not in it. Small wonder, then, that doubts should arise, and especially when one considers the stubborn conservatism of the East in most things, and also the fact that varieties of the plant are by no means all confined to America, as to the possibility of all this having spread from one centre even in the space of three hundred years! Yet it seems to be quite true; and one fact alone is, to my mind, sufficient to prove this unquestionably, although some authorities apparently still incline to the belief that the smoking habit, like so many other things, may have been indigenous in China. The fact I allude to is that Marco Polo does not mention it. As is well known, he travelled right across Asia to China in the thirteenth century; and, had tobacco and smoking been in evidence then, he, an acute observer and recorder of all things new to him, could not, surely, have failed to make note of such a strange custom.

So then, the idea of attempting to disprove the old belief in the absolute American origin—a proposition which I once cherished—must be abandoned as futile, and we must instead content ourselves with a contemplation of the marvel of the now world-wide distribution.

To appreciate more fully this conquest of the world, it has to be remembered what a storm of opposition had to be encountered at the outset: edicts of emperors and kings, Grand Turk and Tsar, anathema of priest and pope and minister, and denunciation of the medical faculties, to say nothing of natural family opposition on the score of expense. Add to this the weakness inherent in the weed itself—the tendency to induce actual nausea and distaste in the incipient votary—and we must but marvel the more. Truly it has all the appearance of a decree of Providence—irresistible—an illustration of the dictum that the good and true must prevail against all opposition.

Statistics of no very old date, recorded in Penn's *History of Tobacco*, show the world's acreage under the plant to be one thousand millions, the annual value of the product being forty-five millions sterling. The revenue from duty in Great Britain is stated to amount to eleven millions sterling. In this connection it should be remembered that we as a nation are by no means to be accounted particularly heavy smokers. Our average, for instance, is only one and a half pounds per head per annum, whereas the Dutchman gets through seven pounds. But, then, he easily beats creation in this respect. To give the extreme illustration. It is recorded of one old sportsman—Mynheer van Klaes by name—that throughout his life he kept up the astounding average of three pounds consumption a week, and therefore got through four tons in his smoking-life of sixty years. He lived to be eighty, and was evidently a jolly old dog, full of humour to the last, for by his will his coffin had to be lined with old cigar-boxes. It was enjoined that a bladder of best golden leaf, with matches and flint and steel handy, was to be placed by his side, and the mourners were to smoke at the funeral; then the last act of all—the solemn 'dust to dust and ashes to ashes,' when all were to knock the ashes from their pipes on the lid of the coffin! So passed this king of smokers. A strange scene, and only to be imagined as possible in those times affectionately remembered as old and good!

Another notable votary was one of the Bismarcks, who affected a cigar-holder made to hold three cigars—these of different brands, making a subtile blend dear to his palate. He also lived till he was over eighty. Then there was Seidlitz, the famous cavalry leader, of whom it is recorded that he would stick to his long pipe during all preliminary manœuvres in presence of the enemy, throwing it in the air only at the word to charge.

But it is not necessary to go to Germans or Dutchmen for the romance of the subject. Quite sufficient of the quality is to be found in English history. For it was in England, indeed, that the smoking vogue first became prevalent in the Old World—all-prevailing it might well be called; for in that first century after the original introduction the smoking habit seems to have so taken hold of the people, high and low, as to be more of the nature of a fantastic craze than a mere universal indulgence; and it is my conviction of the ignorance of most people in the matter which has prompted the present article. How many know, for instance, that there were regular professors of the art in those days, men who would teach you how to smoke fast or slow, to emit the smoke through the nose, to inhale and swallow, &c.; that this art of inhaling, too, was carried to such an extent that men would for wagers engage to inhale the smoke at one point, and not emit it until some designated spot was reached perhaps a mile away; that many other matches were engaged in—fast and slow smoking, and the like; that in the very schools children were *taught* to smoke, being punished for letting their pipes go out? The Puritans, as may well be believed, were at first dead against such an extravagant, not to say ungodly, practice; but ended by smoking in church. Nor was it confined to men; women were equal participators, and, as we have seen, the children were brought up in the way they should (not) go. Varieties in pipes soon became legion, and there was actually a scheme—though this was probably of later date—to provide smoke on tap, even as gas is supplied to houses at the present day.

But this kind of boom was too hot to last. Though the Great Plague gave the craze a final fillip, owing to many of the medical faculty having become converted and prescribing the fragrant weed as a preventive, if not a cure, there was now another influence at work. The great god fashion stepped in, and from France, as in other things at the present day. There tobacco had been known and used from perhaps as early a date as in England (it is from a Frenchman, Nicot, that the word nicotine has come to us); but strangely enough it was in the form of snuff that the Frenchman seems from the first to have preferred the stimulant. And it was this habit of snuffing which, spreading to England, no doubt at first through the fashionable courtiers, for a long time almost completely ousted smoking.

I have remarked it as strange that the Frenchman should have adopted the habit of snuffing instead of that of smoking at so early a period; and for this reason, that, so far as I am aware, this is not mentioned as a habit in America, whence the whole cult came. But, as it appears, there was really some warrant for this form of the indulgence in a very ancient practice at least somewhat similar—similar in that the nose was the organ employed. For it is believed that the very first use made of tobacco-smoke was as an incense. Then, probably by means of a cloth over the head, the smoke would be more effectively inhaled and the soothing effect realised. From this the next step was a pipe with twin stems to fit into the nostrils, specimens of which are well known; and perhaps it may have been long before this was superseded by the variety smoked through the mouth which since has held such universal sway.

In later years many have been the minor variations in the manner of the indulgence practised by various peoples. In pipes and pipe-smoking we find infinite variety, from the primitive holes bored vertically and horizontally in a sloping bank—tobacco placed in the upper orifice, and smoke sucked from the lower—to the elaborate narghile of the Turk or the Hindu hubble-bubble. Scented herbs are used by some to mix with the tobacco, while in India raw sugar is preferred for this purpose. Others again, notably some South African natives, consider that the only way to enjoy a cigar is to inhale with the lighted end in the mouth; while in Mexico, when a pipe requires cleaning, it is said to be customary to fill the bowl with brandy *and drink it*. Such are a few curious samples of more modern practices.

The simple pipe, after all, appears to have been the most ancient manner of enjoying the weed; but the ultimate antiquity of this, whether fashioned for mouth or nose, or of the smoking habit itself, is a question hardly now perhaps to be solved even approximately. What we know for certain is that pipes and cigars were found in full blast by the first adventurers to America, and since then specimens of pipes more or less ancient have been from time to time found among the ruins of native villages. Some of these are no doubt very ancient indeed, and there is not much wonder in this. But one quite recent discovery must give us pause, if only to recover breath and think. A number of old pipes were unearthed—in the Mississippi Valley, as I remember—most of which were fashioned in the likeness of some animal; and two of these were said to be unmistakably meant to represent elephants, no such creature having been known in America, zoologically or geologically, since the days of the mastodon! What next? we must wonder. For this almost brings us to the most extravagant of up-to-date estimates of the antiquity of man himself, than which we shall not find a more romantic conclusion!

MY CASTLE IN THE AIR.

THERE'S a road I often travel to a spot that's far away;
'Tis the most delightful journey, yet the shortest one I know.
But the end of it is best of all, though there I may not stay,
For I keep it quite a secret when I steal away and go.
There's a river and a garden with gay lawns of softest green,
Where the peacocks walk so proudly, and the days are always fair;
And the house beyond the terrace is the finest ever seen;
And it's all my own—my very own—my Castle in the Air.

Just behind that stately doorway there are costly things I prize—
Pictures, bric-à-brac, and china, coats of mail, and sculpture too,
Form and colour chaste and splendid, feast to cheer my hungry eyes;
And I revel in the beauty of my dream-house, as if true.
Yet among my priceless treasures there are dearer ones to me—
Old and faded hangs a portrait, and a little broken chair
Stands beneath; and mem'ry brings them back—those faces that I see;
And I'll keep them all for ever in my Castle in the Air.

O dear palace of my fancy, where my soul unfettered dwells!
Where no care nor fret can reach me, and the aching void is filled
With the love I know is waiting, as your hand clasps mine and tells
Of the resting-place my heart has found; and all my pain is stilled.
For you come to me, my darling, and I hear your voice that sings
Like the music of the river, as you walk beside me there,
And the calm of that diviner peace your nearness ever brings
Folds us both in benediction in my Castle in the Air.

SEVENTH SERIES

THE HEART OF THINGS.

By Henry Leach.

London, *Yesterday.*

NOT taking note of the why or the wherefore, or what may be or will be the end of many arguments and tendencies and events, it is agreed that this is a peculiar and momentous period in the history of our women, in that of the British women more than any others, for their inclination to vast changes appears greater than that of the women of other nations. Altogether, what may be called the problem of women becomes increasingly interesting, and so in a certain sense do women themselves, the sex in the collective, for the individuals and little groups are absorbing now, as before, and they will always be just what they have always been. In the progress of this interest, and as evidence of it in a trifling way, we have had the difficult puzzle being set of late as to who have been the ten or dozen or twenty greatest women of the world; and various indeed have been the answers, as was to be expected when it is considered how widely ideals as to women differ, and must always do. A little while since, when wandering in Paris, one noted that since Joan of Arc was beatified in the Roman Catholic Church two or three years ago, she has seemed to be regarded by the French people with a new and increased adoration, which doubtless arises from knowledge and understanding. In sundry places you encounter monuments great and small to the wonderful Maid of Orleans, and one of the best positions in the Madeleine has been given to a fine sculpture in white marble, towards which prayers are continually uttered, and at whose base floral offerings are laid. Perhaps it was always so, but now at all events there can be no doubt that if a vote of France were taken as to who have been the three greatest women of the world, she of whom is told the romantic story of saving her country and triumphantly taking an ill-beset dauphin to his coronation would certainly be one of them. And yet, as one must say, the amazing Jeanne did not figure in the lists of the world's greatest women as compiled by several persons of great knowledge, judgment, and distinction. Cleopatra you would find there always, but not so often Joan of Arc. And then many British people—for this was an international voting—would notice, with regret and pity for those to whom this voting power had been given, that now and then the name of Florence Nightingale was left out of the list. But if women only were left to make the selections it is likely that the variations of opinion would be even greater than they have been. How wide apart would be the standards set up by, say, a lady of high fashion, an intelligent mill-girl of Lancashire, a leader in the modern women's movements, and a simple country housewife, the mother of many children! Men of an average sort are perhaps nearly in unanimity in this matter. Kindness of heart, gentleness, and sympathy are what five men out of every six most like in the opposite sex. I remember that some time since one of the Parisian newspapers organised a great and genuine competition amongst its readers with the object of determining the Frenchman's ideal, which is not materially different from the ideal of men of other nations, and the result of the extensive voting that many thousands took part in upon the set questions as to the most desirable attributes in women was that 'kindness of heart' came out on the top with a very long lead. A thousand votes behind it came 'devotion,' and then there followed in order 'economy,' 'intelligence,' 'amiability,' 'fidelity,' 'patience,' and 'modesty.' Economy and thrift are among the strongest characteristics of the middle and lower class Frenchwoman, and have made her famous, so it is natural and proper that the man of her country should show so much appreciation of the virtues of his womankind from which he has so splendidly benefited. Every little home in France is a wonderful organisation of thrift, and in a way it is a little bank, so that the latent wealth of the country through this means is a matter that may be of magnificent advantage to her some day, if indeed it is not so already. To her women, whose praises for their infinite charm will never cease to be sung by all peoples, France owes a great debt, and she recognises it.

* * *

Now circumstances conspire to make sharp contrasts continually to be drawn between the British and Germans and the countries and things belonging to them. Our men and boys are compared with theirs, particulars of methods are set side by side; and lately one noticed that the almost inevitable had happened, and that signs

 [*All Rights Reserved.*]

were being given of a disposition to compare British and German women. Efforts in this direction did not then progress very far, and perhaps it was well; but the time may come when the comparisons will be full and free, and then shall we not, like good Englishmen, proclaim the high merits of our own, and leave the German husbands, fathers, brothers, and sons to do the same for theirs, as will be their duty and their pleasure? But in the meantime what has come to notice is something in the nature of a German attack on the Englishwoman on the point of her alleged incapacity in certain directions, particularly in regard to her disposition towards figures, and it arose in consequence of some remarks that had been made on the subject by the Lady Mayoress of London. Following upon these observations, one of the leading newspapers of Germany, the *Cologne Gazette*, came forward with a most remarkable indictment, saying: 'The Englishwoman has the reputation all over Europe of not being a good housekeeper. Even a superficial look into the life of London proves that this allegation, which is of such enormous importance for the life of the lower classes, is not legendary. It is amusing that the discovery has just been made that Englishwomen—the feminine half of the greatest business nation in the world—cannot manage figures. All foreigners who have observed the countless lady-cashiers employed in London restaurants and other business places buried nose-deep in trashy novels and newspapers, have long noticed their shortcomings as calculators. Germany has a multitude of working women who are most excellent at figures, and the Frenchwoman of the lower middle classes can also calculate splendidly. But one glance at the incredible passion for romantic rubbish among Englishwomen of the middle lower classes suffices to make one understand that the daughters of Britannia prefer to live in a fictitious world rather than in the world of reality.' Now this criticism, which in foreign eyes may have some justification, will not be too seriously laid to heart by Englishmen. But I remembered on reading it that in the autumn of the year before last, when for many weeks previously the papers had been full of particulars of all kinds about the Germans and their ways of doing things, an Englishwoman of great intelligence and observation, who had had deep experience of life in Germany and knowledge of it in many different ways, wrote down some very remarkable reflections upon the qualities of the German women and their value to the Fatherland. It was Miss Frances Low, and she took occasion to remark at the outset that the very mention of the German woman in England provoked a smile of superiority and derision, while only a few weeks previously one of the ladies' journals, in commenting upon the very poor progress that 'feminism' had made in Germany, patronisingly exhorted German women to 'wake up,' to remember that they had 'souls above the kitchen and its needs,' and to try to get a little inspiration from their go-ahead English sisters. Miss Low proceeded to say that as she recollected the really extraordinary many-sidedness of the average middle-class German woman, when she noted that there was hardly a form of social reform or organised philanthropy in Germany initiated by the State which was not mainly, or at least largely, carried on by women, she felt how absurd that ignorance must seem to those quiet, sensible, ever-busy maidens and matrons, knowing their *métier de femme* so admirably that at that moment they were leading the way as the finest exponents in the world of the crafts of the household, while they had made themselves indispensable to the progress of the State as the active co-operators in reforms that would have been impossible had they exhibited either apathy or hostility.

* * *

From this Miss Low went on with some illuminating remarks. She related that one time she went into a *Volks-schule* in Heidelberg and listened to a most interesting and lively lesson on 'the making of Germany,' in the course of which the lady-teacher, having explained the part played in war by the Emperor, the soldiers, and statesmen, went on to speak of the splendid services of Queen Louisa, who never ceased to inspire and encourage her husband in his fight for German freedom. There followed after this some questions and answers given with tremendous enthusiasm: 'What can men do in time of peace?' 'They can learn thoroughly to serve and defend their country.' 'What can women do?' 'They must preserve the home and bring up every child to feel he has a great country which he must serve.' 'Now, the radical difference,' Miss Low wrote, 'between the average English woman and the average German of the same class is this: the former hails every advance in her husband's income as a means of freeing herself more and more from a disagreeable bondage, that of maintaining by her own personal exertions an efficient home; the precise opposite takes place with the German lady. . . . It is this simplicity and dignity and singleness of aim which characterises the home-life of the Germans, so that more than with any other nation on the face of the earth to-day there exists a family life instinct with idealism that has been the salvation and preservation of Germany, while other nations are seeing its disintegration and decay. The modern German woman has not the vivacity and brilliance of the American woman, nor has she the genius for exquisite dress and unerring taste of the French woman, or the graces and fascinations of the Southern woman, or, finally, the fresh and matchless and high-bred physical beauty of the English woman. But of all nations, we believe her to be the greatest asset, the creator and

guardian of a sacred flame that is the inspiration of that love of the Fatherland found in each one of Germany's sons.' These are remarkable expressions, and they should be well remembered. Home-life in Britain has been held up as the model and one of the foundations of the greatness of the nation. Here is Germany's, on high and impartial authority, said to be better, the credit being given to the German women.

* * *

Of all the arts, music is the most cosmopolitan and the most direct in its appeal to the artistic instinct that has had no exact training, because its appeal is so sensuous, so natural, so human, and because it touches the primitive instincts and thrills them. Some may reason, then, that the quality of the artistic soul of a people is to be reckoned by its appreciation of music. It might be fair to do that or not. But if a reckoning were made on that basis, how would Britain come out of the test? And why are we so sensitive on that point which is so often raised as to whether we are a musical nation or not? Other nations are not so sensitive. There are not discussions constantly going on in American, German, French, and other papers as to whether their respective peoples have musical feelings or not; but we are protesting constantly in the matter, and while impresarios and composers are despairingly moaning that we are hopeless, there are representatives of the people who maintain that we are as musical as any other, but are not encouraged properly, and are not given a fair opportunity for the display of our tastes. Now that question as to whether we are a musical people or not, which has been asked and variously answered thousands of times in recent years, has been put more persistently and significantly of late than used to be the case, and it has almost begun to seem that we are being brought up for trial and judgment. Charges are being definitely formulated, evidence is being produced, and a defence is being put forward. A few weeks since the Incorporated Society of Musicians had a conference, and it came out in the course of discussion that musicians are so badly paid in England that a band and conductor may be hired for thirty shillings, and that lessons in music may be obtained from a teacher for sixpence each, or seven shillings and sixpence per term. So we pay badly for our music, and evidently, then, are not particular about the quality; and yet it is clear that we like much of it of a kind, for we have it everywhere, and there is a disposition among observers to conclude that the real case is that we are fond of sounds and know nothing about music, and furthermore that all efforts to improve our taste are doomed to failure.

* * *

As I write the main question is being tested in a way that it never has been before; and though the test is being made in London, and for the most part on London people, it is a matter in which to a considerable extent the country in general is concerned. The allusion is to the attempt by Mr Hammerstein, who has achieved remarkable successes elsewhere in fostering and improving musical taste, to establish grand opera in this country as a regular entertainment for the people. Hitherto we have not had the opera as a permanent entertainment, but only as something for a short season, and that when the society folks are in town and as a society affair. Before he embarked upon his enterprise, Mr Hammerstein was told that we were not a music-loving people in the way that he hoped and believed we were, and to an extent that would be necessary to ensure his success; but he persisted with his confidence in us, and has made his experiment on a very splendid scale. The Opera-House he has built in Kingsway is the finest thing of its kind in the country, and he has produced grand opera in a splendid manner during the little time that he has been there. When music is merely a matter of fashion, and there is no real appreciation and understanding of it, names are everything and voices much less; but when the listeners have intelligence and discernment it is the other way about. Mr Hammerstein dispensed with great names, but without any doubt he has tested his audiences with voices, and in Miss Felice Lyne and Mr Orville Harrold has introduced to them two new artistes of the very highest ability and power. Mr Hammerstein's experiment is a worthy one, which places us in great debt to him. Then, being on the scale that it is, our artistic credit is to some considerable extent at stake, and it is the melancholy but not wholly unexpected fact that, at the beginning at all events, it was not a success. When it was found that this was so, those who defend us in the matter of our musical tastes and appreciations began to make excuses for us. It is said that we are not rich enough to pay the prices for grand opera that are being charged for it, and accordingly we are being accommodated in this respect. An effort is being made in different ways to reach the bottom of the truth about the British person's taste for music, and the nature of the experiment is being varied in different ways. What will be the upshot and the verdict remains to be seen. There are, however, two points to be urged in defence of our people in this matter of grand opera, if it is that they have to be defended. The first is the fact of such opera in the great majority of cases being sung in foreign languages which are not understood by the listeners. It is splendid to present these works in foreign languages—Italian, German, and French—when the opera is merely a society entertainment, and some cynics might declare that it is all the better for not being understood, or that it does not matter, anyhow; but it is different when the whole public are being dealt with and

the social aspect simply does not exist. It is not only that we British people do not speak three or four languages per person, and it is not only that the story—which after all counts for something—is not understood in a foreign language, and some of the value of the entertainment is missed; but the whole meaning of the music is lost and its subtleties and beauties are squandered. It would be almost a miracle if any people were to understand music in this way; it would be nearly as reasonable to expect them to laugh at a joke told in a tongue of which they did not know one word. The production of operatic works in their original language is entirely a matter of convenience, or convention, or both. It seems more imposing, but it is certainly less interesting and instructive; and the suggestion that it is better done in foreign languages is not always true. Italian, in its warmth and colour, its liquid softness, and its power of expression, has advantages for vocal effect that no other language has; but it is not properly appreciated that English, in spite of its many sibilants, is next to Italian, being decidedly superior to the guttural German, and better even than the nasal French. Grand opera might be made popular in English—indeed it has been—and we might get a better reputation for our taste.

* * *

Again, it is a point, considering the nature of the times, the fierceness of effort, and the strain upon us, whether the themes of many operas, as they pleased the people of a previous generation, are quite the happiest and best and most suitable for us at present. The disposition of people everywhere to take their amusements lightly is very noticeable, and the people are not altogether to be blamed for it. It is not quite the fault of their taste so much as the necessity of their case; after so much strain a light relaxation is needed by the majority. Why should even grand opera be always so unhappy? It is gloom and tragedy most of the time. Perhaps it may not have been realised how sorrows and sadness do dominate grand opera as we know it, and how catastrophe governs so many of the works that are most presented in modern times. At the beginning one may leave aside *Faust*, because it is really in a class apart from others as a classic among classics; but take some of the others. In *Rigoletto*, through a mistake the heroine is murdered, her father being responsible for the tragedy; in *La Traviata* the heroine dies of consumption; in *Lucia di Lammermoor* the heroine stabs her husband and dies broken-hearted, while the hero stabs himself; in *Aida* the hero and heroine are buried alive; in *Carmen* the beauty deceives a lover, and he stabs her; in *Il Trovatore* the hero is executed and the heroine takes poison; and so on. Now, on the plain stage they will not have all this horror at the present time, and one is inclined to wonder whether it is all good for the health of grand opera, even if it does facilitate the expression of passion and fervour in the singing. One has heard it suggested that in opera there is this demand for tragedy. Strange, then, that musical comedy, with its exaggerated lightness and all its silliness, should be so popular, and that tragedy in plain drama does not go very well. This investigation into the charges against the English of being unmusical needs to be carried far, and the defence may spring new points and evidence upon the accusers.

THE CAHUSAC MYSTERY.

CHAPTER XX.—THE BEGINNING OF THE END.

DE SARSAN had acted generously. Mrs Westaway had told him so, the compliment being confirmed by a look of relief and gratitude from Alice's pretty eyes. He felt as self-complacent and cheerful as a benevolent man has a right to feel. Alice had begged that the engagement might not be made public yet awhile; and De Sarsan, after some flattering demur, had given in handsomely. In fact, it struck him as being in some respects a convenient arrangement. It often happens that the longer you can mask your game the worse for your opponents.

It must be conceded that Alice Lanceley's motive was a commonplace one—merely to put off the evil day. The announcement would serve not only to rivet her yoke, but to destroy the other hope which she still weakly cherished. She craved for one more interview with Malcolm; a time in which to explain, to say to him that she understood his position, and would never blame him; to tell him much that she had often longed to say, but had never been able to frame—trifles perhaps, but of great moment to her. It must not be supposed that she contemplated breaking her promise to De Sarsan; she did not waver in that. It was a sacrifice which she must make for Wilford's sake—she now believed that, had she been alone, she would have chosen rather to face the world—and she meant to make the sacrifice in good faith. Meanwhile she could not find the courage to turn the lock on possibility and hope. She longed to meet with Malcolm in some happy hour when she could set herself right with him. She feared his condemnation; she wept as she pictured his contempt when he should hear of, without understanding, her acceptance of De Sarsan, of a man whom he (Malcolm) abhorred. Her apprehensions moved round and round in the same hapless groove; she could not conceive of the broad, pitying

kindness with which Cahusac would have judged her.

Great catastrophes are usually referred to the working of great passions; but the machinery of fate is often set in motion by some weak desire, some foolish impulse, some unnecessary vanity or puerility. The irony of the thing lies in the fact that those who touch the levers are so seldom damaged in the final crash.

The tremendous results which were to follow upon Alice's rash wish to set herself right with Malcolm were hidden from her eyes always. She never realised from first to last that it was her hand which brought about the consummation of the tragedy.

It happened on a day towards the end of June. De Sarsan had begged, by way of a return for allowing the engagement to be kept secret till the end of the season, that the marriage should take place immediately afterwards. Even Wilford was, by Alice's request, to be kept in ignorance for the present. Wilford saw that De Sarsan was paying court to his sister, and was apparently well received, and he might have guessed the rest for himself if his mind had not been entirely taken up with his own affairs.

Lorrie, indeed, saw Wilford pretty often, but other people were always present. He had had no chance of urging his suit afresh, and in consequence his humour was one of chronic peevishness. Therefore on this balmy June morning he lounged about the dining-room at Park Lane and grumbled freely. Alice, who was answering notes for Mrs Westaway, tried to suggest subjects more cheering than his own affairs; but he would have none of them. After a while he stood drumming on the window-pane in silence. Alice had had time to write half-a-dozen notes before he spoke again.

'I say, Alice, stop scribbling for a minute. Can't you write at some other time except just when I happen to drop in?' Wilford said crossly. Then, turning round, 'Come here; I want you to do something for me.'

Alice got up obediently and stood beside him.

'For Heaven's sake, don't stand like that, as if you were in a hurry and couldn't listen to a man quietly for once! Sit down.' He pushed a chair towards her, and sat on the edge of the table. 'We're in a devil of a hole, you and I,' he began dejectedly—'in a devil of a hole! Now, just look at you'——

'Suppose we look at you for a moment. Tell me what I can do for you,' she said with a little smile, anxious to avoid the inevitable turn of the conversation in the direction of De Sarsan if her own future came under discussion.

'Oh, very well, if you don't want my advice!' he rejoined huffily; 'but I tell you you'd be wise to hook De Sarsan while you can get him. It would be only decent, considering what the fellow is doing for me just now. And look here'—as a happy inspiration suddenly struck him—'I've been thinking that you would prefer to have me off his hands before it came to a question of marriage between you—eh?'

'I don't see what I can do,' said the girl with great embarrassment.

'Well, that's just what I'm here to tell you, isn't it, stupid?' But his tone was coaxing and good-humoured now, and Alice smiled up at him in relief at the somewhat unusual fact. 'Now, Alice, put aside prejudice, like a good girl, and don't refuse my request in a hurry. I want you to go and see Lady Madesson.'

Alice turned white. 'I!'

'Yes, you!' mimicking her tone. 'I mean to marry Lorrie; and, after all, why should you object? She's as good as you are any day in the week, as well as cleverer and richer and handsomer, if it comes to that!'

Alice was very still, wondering in her heart if Malcolm thought so too by this time. 'She—she is said to be engaged to Malcolm,' she said after a minute.

Wilford sprang to his feet and seized her by the shoulder. 'Who told you that infernal lie?'

'M. de Sarsan.'

'Oh, De Sarsan!' He sat down again, relieved. He understood that De Sarsan might say something of the kind to further his own purposes. 'It may be so, of course; but I'd like to make sure. Alice, I care for that woman more than anything in creation, or heaven—if there is such a place. It is perhaps the one honest feeling left about me. Don't take upon yourself to condemn it. Go to her, for my sake, and tell her how it is with me—that the suspense is destroying me! She has a kind nature below all; get at her; touch her. You can do the trick for me if you put heart in it, Alice. Will you? Upon my word of honour, I believe that marriage would make a decent man of me!'

'Very well,' the girl said, 'I will go; though I don't suppose I can do any good. She is so clever!' She sighed.

Wil looked quizzically at her with some significance. 'Cheer up, old lady; it's the stupid ones who mostly win in the end, you know,' he said ambiguously.

After he had gone Alice collected her notes into a heap, setting them one over the other with an air of abstraction. Accredited with such an errand, she could hardly fail to find out how Malcolm stood in relation to Lady Madesson.

After lunch she drove over to the quiet square where lay Puyfot's dreamland. Dismissing the hansom at the entrance to the square, she walked along the pavement very slowly, for now that she was almost at the door she felt very little of the courage or self-confidence necessary for such an interview.

Counting the numbers ahead, she had just picked out the flower-laden porch as the one she was looking for, when a man emerged from its shadow and came towards her. It was Malcolm!

She stopped short, breathless. She saw his face change as he recognised her, and her heart throbbed more painfully. Distracted by her troubled thoughts, she looked just like a lost child.

As he shook hands with her he said involuntarily, 'Can I not help you, Alice? Where are you going?'

'I want to see Lady Madesson. I want to see her alone,' she replied confusedly, for here was the very opportunity of talking with Malcolm that she had been longing for, and she must take advantage of it to make that explanation which was to render her life more endurable in the future.

'Why, she has some people to lunch,' Malcolm answered with manifest surprise. 'I have been there myself, and am one of the first to leave.'

'Oh dear! and I wanted so much to see her alone.'

Cahusac was perplexed at Alice's anxiety for a private talk with Lorrie, whom he knew she had never liked; but he concluded that it must be on some errand of her brother's, and he wondered what selfish object Wil could have in view 'I will take you to Lady Madesson's house and let her know,' he suggested. 'I am sure she would be very glad to see you.'

'Oh no, that would not do at all!' She scarcely knew what to say. 'It will be better for me to come another time. Would you walk with me till I see a hansom?'

Malcolm turned beside her. 'But why not go to Lady Madesson's now?' he said, for his old wish that Alice and Lorrie should be friends returned upon him with force.

'I think I ought to tell you, Malcolm, that I have a message for her from Wil,' she answered, speaking hurriedly under the recollection of what De Sarsan had told her respecting her companion and Lady Madesson. 'You know that Wil cares for her very much; you remember that evening at Ashmills? I wonder if she—if she likes him?' She was aware that she was saying precisely those things she should not say. 'But I beg your pardon, I ought not to talk like this to you.'

Malcolm was smiling. 'Why not? Though I am afraid I cannot tell you what you want to know, for she has not confided in me.'

They turned the corner as he spoke. From the other end of the street an empty hansom was approaching. At sight of it Alice felt that the chance of disburdening her mind, of conveying to Malcolm all that she had prepared through the long nights since she saw him last, was fast vanishing.

'I have been wishing to meet you, Malcolm. There are so many things I have to say to you,' she faltered. 'The other evening I tried to tell you. I cannot make you understand. I don't know how to begin.' She wrung her gloved hands together.

Cahusac was very much in love, or perhaps much of this conversation would have seemed rather absurd to him; as it was, pity and tenderness claimed him to the exclusion of everything else. 'What is it you want to say to me?' he said gently, walking still more slowly. 'I will understand.'

'In the future, when we cannot explain to each other, will you try to believe that I am not so very much to blame?' she went on. 'I cannot help—things happening.'

His face grew hard. What in the world was she alluding to? 'What sort of things?'

In her bewilderment she did not notice the change in his voice.

'I mean if you were to marry some one—any one—I should know that—that you could not help it,' Alice said timidly. 'I have felt how hard it is to make one's life fit in with what one would like it to be.' Then her growing agitation wrung the true cry from her heart. 'But, oh, Malcolm, don't you think that happiness is worth more than all the other things? Nothing matters as long as we are with those we love! And yet we all seem to be struggling for money and things that don't make us a bit happy in the end. Is it worth while to give up so much for so little?' She had found speech at the end. She was pleading for lost love and lost happiness; her mind was plunged into a chaos of feeling and retrospect, and her main idea was to impart to him some of the thoughts which ached so continually in her own breast.

The hot afternoon street was almost empty, so that Wilford, on his way to Lorrie Madesson's—for he intended to strike while the iron was hot from Alice's fanning—was astounded to see his sister walking beside Malcolm Cahusac, with her hands clasped in evident emotion.

'Good heavens!' he reflected, 'if De Sarsan were to get wind of this, and that I had sent her here by herself, he'd dock my allowance worse than ever. I wonder how Malcolm got hold of her?' He walked rapidly after them. As he came up he could hear Alice speaking.

'Oh, but do you think it is the best? It is so easy to say things are best for one which only mean more money, better position; but it is not true! The richest princess in the world can be very unhappy!'

'Alice!' Wil caught her by the arm very quietly, but she hardly suppressed a scream. Then he turned upon Cahusac. 'How dared you induce my sister to meet you in this clandestine manner?'

Cahusac glanced at Wil and smiled in spite of himself. 'Don't be absurd, Wil! This is not a melodrama, but an ordinary meeting together of three people who have known each other all their lives. I chanced to meet Alice in Devos Square, and offered to find her a cab.'

Wil scowled after Malcolm as he walked away, but he said no more until he and Alice were driving back to Park Lane.

What he said then, and Alice's feeble excuses,

need not be written down. Her greatest offence lay in her failure to see Lorrie Madesson.

'What! go to see her to-morrow?' he ended harshly. 'No, for goodness' sake don't! Leave it alone; you'd be sure to bungle the whole thing! And stop crying.'

When Wilford left his sister he was in a white-heat of disappointment and rash anger. At such times he felt an irresistible desire to talk to anybody, it mattered little to whom. He forgot prudence, and set out for De Sarsan's.

He found the Belgian at home, and in his irritability he made the most of the earnest and almost impassioned interview he had cut short.

De Sarsan listened patiently until the flow of complaint and temper had run itself out. Then he asked, 'What induced your sister to go to Devos Square?'

'To see Lorrie, if you want to know.'

'On your affairs?'

'I'm hanged if I'm going to be cross-questioned!' answered Wil with heat. De Sarsan's way of turning the tables upon him was intolerable.

'Ah, so! I understand,' said De Sarsan.

And this was the very beginning of the end.

(To be continued.)

THE FRENCH WORKMAN.*

By Robert Seppings-Laws.

THE workmen of France may be classed under two heads, the man belonging to *la petite industrie*, and the man belonging to *la grande industrie*. The workman in the former class is totally different from the workman in the latter. The *petite industrie* comprises all work not done in a factory, but where the motive-power is generally supplied by man. The *grande industrie* includes all work done in factories, foundries, mills, mines, &c., where large numbers of workmen are employed, the motive-power being generally steam, water, or electricity.

It is *la petite industrie* that has for centuries in a great measure earned for France its reputation as the country where the best work is done; and only the British workman at his best can be compared with the French workman of the small industry. In France the order of merit for the quality of the work produced by the principal industrial states stands thus: (1) France and England, (2) Belgium and Holland, (3) Italy, (4) United States, (5) Germany and Scandinavia—the last two far lower in quality than the others. Probably Switzerland ought to stand in the second group, coupled with Belgium and Holland, and Austria with Germany and Scandinavia.

I now quote on this subject the remarks of my friend M. Joseph Barrère, the well-known Bordeaux barrister:

'The French workman employed in *la petite industrie* is generally fairly intelligent, having a good knowledge of his trade, and is in most cases a *débrouillard* [managing to do a difficult piece of work well, even when not of his own trade]. He has to undergo a strict apprenticeship, during which time he is well looked after by special laws.

'In olden times the apprentice used to make the tour of France, so as to learn his trade. On his return he was called a *compagnon*, and was free to work at his calling. After the Revolution of 1789 the workmen's corporations were all abolished, and everybody is now free to choose his calling and can exercise any trade he wishes.

'The workman generally prefers to marry and have a home, and is fond of his children. Since the Second Republic the workman has become an elector; he loves talking politics and occupying himself with them, to read his newspaper, and to vote. He is not such a bad voter either, and he is far from being converted to socialistic theories, because he still believes in the power of work and economy.

'The workman, then, is generally economical, and possesses a savings-bank book; he also tries to get together a small capital. Of late these modest economies run some little risk of not being continued, owing to some of the shops having adopted the credit system or "easy terms of payment." This is a great danger to the spirit and practice of thrift, as the deferred payment system may induce the workman to buy luxuries he could very well do without. It would appear, however, that the number of workmen in France possessing a savings-bank account has increased within the last two years.

'The French workman is generally a sober fellow, but he likes to have "a good time" occasionally. He also likes to work on Sunday and rest on the Monday. On the whole, his education (apart from technical knowledge) is defective, notwithstanding the extraordinary impulse given during the last thirty years to elementary education, which is obligatory. He forgets very quickly the little history and geography he learnt at school. The Government is trying to remedy this by forming what is known as *œuvres post-scolaires*. At Bordeaux there are very fine institutions of this class, with public libraries open in the evening for conferences and free lectures given by excellent professors of the Société Philomathique, &c. During the young workman's two years' obligatory military service he is enabled to go over, at the *école primaire* in the regiment, all

* A paper on 'The German Workman' appeared in the volume for 1910, page 516.

he learnt as a schoolboy, thus refreshing his memory with what he was rapidly forgetting.

'The French workman generally makes a good soldier, easy to teach, understanding at once the officers' orders and the object of the words of command. He soon makes a good corporal, also a good non-commissioned officer. His sentiments are good, and his heart is in his work. To those who, like myself, have lived in barracks as a private soldier,' says M. Barrère, 'and have risen to be a captain of the reserve of officers, it is known that the workman of France is an inexhaustible source for providing the best soldiers.'

The French workmen have no Government pension in old age, but most of them belong to a mutual help society.

The wages of the workmen of the *petite industrie*, of course, vary somewhat in the north of France compared with the south. In the north and north-west a good workman—say a house-carpenter, locksmith, blacksmith, or mason—earns from threepence halfpenny to fourpence a working-hour, about four francs (three shillings and fourpence) a day of ten hours. Those who work by the piece can earn four shillings a day. A really clever specialist will earn a great deal more. In the south-west—Bordeaux to Bayonne, for instance—locksmiths, whitesmiths, chauffeurs (automobile), shoemakers, carpenters, joiners, &c. earn from four francs fifty centimes to five francs (say three shillings and sevenpence to four shillings) for a working day of ten hours. Again, a specialist earns considerably more. In the great cities, such as Paris, living being dearer, the rates for skilled workmen may be slightly higher; but I think the figures given apply fairly to France generally. Wine-merchants' and brewers' men earn from three francs and upwards, and their coopers from four francs fifty centimes.

About four or five years ago a law was passed by which every employer had to give his workmen one clear day's rest a week, known as the *repos hebdomadaire;* but the day need not be Sunday. There are inspectors stationed in towns for the purpose of seeing it carried out.

The workman pays a small tax, known as *cote personelle et mobilière*, when his rent is more than ten francs a month (say eight shillings); under that he is considered 'indigent,' and he is exempt. The employer in France is responsible for all accidents which may happen to the workman while at work. It is a hard law for the masters, and naturally they insure against the risk.

The workman of the *petite industrie* works about ten hours a day, but formerly he worked twelve. The masters complain that ten hours are not enough; but in certain trades the workmen are trying to obtain a reduction of two hours, or only eight hours of work. This is a grave question, as politics are mixed up in it. Nearly all workmen of the small industries belong to *syndicats professionnels* or trades-unions. Without being aware of the fact, they are going back to the old corporations that existed prior to the First Revolution, and were suppressed in 1789. If the trades-unions of France would keep free from politics they would do more good.

The French workman, unlike the German, goes to his work in the blue suit in which he works, and of which he is proud. When he is not working, however, but going out with his family, he dresses quite neatly. My experience, after a residence of about thirty years in France, is that the French workman generally is a polite, good-natured fellow, ready to help anybody, and, if on the whole economical, he lives well, and has very good food and plenty of it, with good wine and good coffee to drink. In the north beer takes the place of wine, and in the north-west cider.

So much for the *petite industrie*. Let us now turn to the *grande industrie*. In every case where the laws and customs apply to the two industries I will merely mention the fact, and the reader by referring to the *petite industrie* can learn how matters stand.

The workman employed in the *grande industrie* is probably inferior in intelligence to the man of the *petite* or small industry, although in many ways the former has replaced the latter of late years, as he has in Britain. The factory now makes the first part of an article, which is then finished by the skilled workman of the small industry. Physically, the workman of the mill is inferior to the artisan, less civilised, and during strikes more difficult to manage; especially is this the case with the miner. This, of course, does not apply to a minority, who are very superior. In the mills wages run from four francs (three shillings and fourpence) to six francs (five shillings) and even to seven francs (five shillings and tenpence) a day. The miners make five shillings and sixpence, and even more. These figures I have from a friend in the north. The mill-hands, as at Elbeuf, Roubaix, Lille, like the miners, are somewhat a race apart, and belong to the north-west and north except those of the silk-mills of Lyons, the rolling-works of Creuzot, and the arms-manufactories of Saint Étienne, which are in quite other parts of the country.

The workman of the *grande industrie* begins young, and is paid even as a boy; but, like all Frenchmen, he has to put in two years' of military service. He usually returns to the same work when his time is up. Of course he pays the same taxes as in the *petite industrie*, and he also has a vote. Most of the men belong to mutual aid societies and trades-unions. The latter, I am told, have more hold on the workmen of the *grande* than on those of the *petite industrie*. In many of the large undertakings, railways, construction companies, &c., a regular system of pensions on retirement exists. The law of masters' responsibility for accidents is the same as in the small industries.

After many years' residence in France my

private opinion is that owing to studied protection the success of imported and popular specialities is generally prevented. The speciality is soon copied, much improved in quality and shape, and sold honestly as French; and only in a few cases of superior British things can these specialities continue to be sold at a profit. The copy is as good as the foreign article, and slightly cheaper. Inferior qualities, mostly made in Germany, succeed for a time; but the French character is opposed to cheap things; it prefers to pay more and have a good article.

During the two years the French workman has to give up to military service he learns order, cleanliness, and sobriety. His health is improved by proper exercise and by wholesome food. He has also the great advantage (as indeed every Frenchman has) of mixing with his fellow-men on an equality. I have always heard all respectable workmen express their gratitude for having been obliged to do their *service militaire*. They say they feel their country is no longer as it was in 1870, but safe as far as possible from invasion. They never seem to boast or wish for war, but all are ready to fight if necessary; and peace at any price is not popular with Jean Baptiste.

THE WRATH OF ISHMAEL GOUDIE.

CHAPTER VIII.—THE GREAT SURRENDER.

EARLY one afternoon in the following August, Robina Peebles locked the door of her cottage and set off on the two-mile walk to Braeside.

As a place of residence Braeside ranked socially higher than Pittendrevie. Judged numerically, its population might not be much larger than that of the lochside village; but it possessed a bank, a real draper's shop, a constabulary station, and a doctor. It was towards the house of the latter that Robina was moving with feverish speed.

Heedless of the rain that fell with quiet persistence, she had walked quickly—more quickly than she realised; yet as she neared the little town her pace unconsciously slackened, and when she reached Dr Mickle's house she hesitated, and then passed it by, only to turn when a dozen yards away, retrace her steps, and ring the bell. 'Is the doctor in, Ellen?' she asked when his housekeeper opened the door.

'Ay, he's in,' Ellen grudgingly admitted; 'but he's jist sat doon to his denner.'

'Perhaps I'd better come back later?'

'In twenty meenites, or maybe quarter o' an hour, he'll be done. He's had a long roond the day, an' he's jist new hame.'

Almost welcoming the brief respite from the task she had set herself, Robina occupied the time of waiting by first going to the post-office and drawing a sovereign from her savings-bank account. A glance at her bank-book told that during the past year like withdrawals had not been infrequent. And as he paid out the money the postmaster wondered why Miss Peebles was diminishing the capital that, though insignificant, represented the savings of years. Had he seen how Robina hastened to spend part of the sovereign he would have marvelled still more; for at the grocer's she bought a bottle of brandy and two lemons, and from the chemist a flask of eau de Cologne, being particular to have both liquids of the best quality.

When her shopping was done, and she judged that the period of waiting had expired, she returned to Dr Mickle's.

'And what's your will with me?' asked the old doctor, who had known her since childhood. 'I haven't seen you for a long time. If all my patients were like you, Robina, I'd need to be drawing my old-age pension.'

Robina laughed mechanically at the little jest. 'It was about myself I wanted to consult you, doctor,' she said, rushing upon her mission. 'For a long whilie back I've been troubled with a pain in my chest and awful bad palpitations, and there's times I can scarcely breathe; and if I go up the stairs I'm that short of breath.'

She had paused abruptly. Without speaking, Dr Mickle leant towards her and laid his fingers lightly on the wrist of one of the hands that lay, tightly clasped, on her lap.

'Yes!' He uttered the word quickly, making no comment, but gravely awaiting the recital of further symptoms.

'And then there's the wee cough'——

'Do you cough much?' Dr Mickle asked quickly.

'Not much, for it hurts that sair I try to keep it back.'

Dr Mickle nodded meditatively. His eyes were fixed on her flushed and agitated face. 'I see, a painful cough! And about the nights?'

'Oh, that's the worst, doctor! Many's the night there's no right sleep at all—just a kind of doverin' between sleepin' and wakin'. And then the awful disturbin' dreams!'

'Did you notice any swelling?'

'The feet get terrible swollen at nights, doctor. An' in the mornin' they're all right again; but in the mornin' the face seems real puffy-like.'

Rising, Dr Mickle fetched his stethoscope. 'Open your gown. I'd like to sound you.'

When his ear was at the instrument his expression changed; it ceased to be anxious, and became puzzled, then slightly annoyed. 'Tut, tut! tut, tut!' he murmured. 'Well,

Robina, you can keep your mind easy. You're no' gaun to die yet,' he said, laying the stethoscope down on the table. 'I'm thinkin' you've let yourself get a wee bit nervous. There's nothing at all the matter with your heart. I'll stake my professional reputation on that. Your pulse is a bit quick and flurried, but your heart's as sound as a bell.'

Robina, who had moved away to refasten her bodice, turned to face him. To his surprise, dismay had taken the place of the relief he had expected to see mirrored in her face.

'Oh doctor, can you not give me something to help the pain and that exhaustin' breathlessness I told you about?'

'You gang awa' hame, my lassie.' The old man laid a kindly hand on her shoulder. 'And mind ye dinna sit ower close over your dressmaking. Gang out, and take a brisk walk while the days are long. And dinna keep aye thinkin' about how you feel. You've a fine constitution, and you come of a healthy race.'

Thus summarily dismissed, Robina stood uneasily, hesitating.

'But the medicine'——

The doctor rumpled his gray hair impatiently. 'Oh you women! you women! you're all alike. You think a bottle of physic'll cure anything under the sun. I'm telling you you don't need any medicine. The most that's wrong with you is a touch of indigestion. Take a good walk, and don't eat cheese to your supper, and you'll not need to poison yourself with drugs. But I'll give you a bottle if you'll not be satisfied without it.'

When he handed his patient the bottle Dr Mickle added another warning. 'Mind you don't go reading medical books, and getting your head filled with foolish fancies.'

At the insinuation Robina's pale eyes opened to their widest.

'Me read medical books, doctor! There's never been such a thing in the house!'

'Hypochondriac!' As he stood at the door watching Robina Peebles trudge off through the rain, Dr Mickle diagnosed her complaint in one word. 'If a woman-body sits all day alone, she'll get to fancy she's dying if her finger aches!' But as he watched her turn into the road that led towards Pittendrevie he was impressed by something in the despondent droop of the spinster's long back, a sort of hopeless dejection, as though some aid on which she had been counting had failed her; and it was with an uneasy feeling that he had come short of what had been expected of him that Dr Mickle returned to his comfortable arm-chair and his novel.

But though at the moment he succeeded in banishing them, Robina Peebles and her imaginary ailments kept recurring to his thoughts. For one not personally acquainted with the disease she described, Robina appeared to have a curiously comprehensive knowledge of its indications. She said she had not read of the symptoms she described in a medical book, and he had no reason to doubt her word. But though he had failed to discover any heart-trouble, the doctor had noticed that Robina had aged strangely during the past year.

The matter harassed his mind; and when, at the close of the following day's round, he found himself on the high-road east of Pittendrevie, Dr Mickle alighted from his gig, and telling his boy-groom to drive slowly on, and to wait for him at the cross-roads, he went back and knocked at Robina's door.

During the moments that elapsed while he waited Dr Mickle thought deeply. When Robina opened the door he stepped inside without heeding her exclamation of surprise or waiting for an invitation.

'Robina,' he said, 'there's two folk ye should aye tell the whole truth to, and that's your Maker and your doctor. The One kens it already, and the other canna help ye if ye just tell him the half. Come, lassie, it's no' ower late yet. Make a clean breast of your troubles. Your secret'll be safe with me. I'll maybe be able to help ye. And in any case you'll be a hantle easier in your mind.'

So, sitting with him in the once trim but now uncared-for little parlour, Robina Peebles unburdened her soul of the story of those months that had turned her from a self-complacent spinster, secure in her own uprightness, to a worn woman filled with an infinite compassion for sinners and suffering.

Speaking in a quiet, unemotional manner, she told how, on that placid spring evening, she had returned from escorting Mirren Dawson part of the way home to the Hainings to find Ishmael Goudie fainting with pain, lying huddled up in her back porch, which he had reached just as Mirren and she quitted the cottage by the front-door. She told how Ishmael, seized by a wrath that was no longer controllable, had lifted the gun and killed Walter Goudie, and had escaped from the farm by crawling painfully behind the hedgerows until he reached the haven of her porch, where, maimed and helpless, he threw himself on her mercy. Of her own suffering, of the silent endurance entailed by those sixteen months of concealment and apprehension, she said nothing; but Dr Mickle read their record in her rapidly graying hair and haggard eyes.

'Where is he now?' he asked.

Rising without a word, Robina led the way up the narrow, creaking stairs to the low-ceilinged attic room where, on a mattress spread on the bare floor, Ishmael Goudie lay propped up with pillows.

'Well, Ishmael, my man, this is bad hearin',' the doctor said, as, kneeling beside him, he grasped the worn hand.

'I'm near by wi' it, doctor,' Ishmael said

faintly. 'An' I'm no' sorry. It's been a hard struggle.'

There was no need to ask questions. To the experienced practitioner the swollen face, with its patches of vivid colour, the emaciated frame, the dry, blue lips, the laboured breathing, all told their story only too plainly.

Leaving the two men together, Robina slipped away. Tears of relief were streaming unheeded down her cheeks. She had come downstairs with the intention of making the doctor a cup of tea, but when he sought her half-an-hour later the kettle was still cold, and Robina was sitting nerveless and almost overcome by this sudden relief from the strain that for so long she had borne alone.

None but she would ever realise the difficulties of the task she had undertaken when she set herself to conceal in her house a badly injured criminal for whose capture a reward was offered. In the retirement of a great city, where one's comings and goings are of small moment, the matter would have been a comparatively easy one; but in a cottage whose walls abutted on the public road, in a village where she had lived from childhood, where the slightest deviation from her customary manner of living or the smallest increase in her expenditure would be matter for instant comment, the undertaking presented almost insurmountable difficulties.

During the early days when Ishmael Goudie had lain fevered and prostrate on the improvised bed on the garret floor, scarce conscious of anything but the intense pain of his injured knee, his nourishment had been easy to supply. Little crossed his lips except milk, or beaten egg, or a few drops of brandy from the bottle that Robina had kept by her in case of sickness. During those days she drank milkless tea rather than get a halfpenny-worth more than her usual quantity of milk.

The most difficult period was when the fever attendant upon the severely inflamed condition of the knee-joint had gradually subsided, and Ishmael's appetite for food began in a measure to return. Then Robina breakfasted off milkless porridge, and dined off potatoes and greens, that Ishmael might enjoy the tea and bread-and-butter, and the small portion of meat, that had formerly been her diet. By laying in a barrel of flour she was able secretly to supplement her weekly loaves with an unlimited supply of home-made scones.

The injured knee she had treated with such simple remedies as she had in the house—fomentations of dried camomile flowers and soothing lotions made from the withered heads of poppies that had grown in the garden.

While the search went on and public resentment ran high against the murderer who was moaning away his days in her attic chamber, Robina forced herself to act before the world as though nothing had occurred to change the tenor of her life. She went to church, taught in the Sunday-school, crimped her drab hair, put on her gloves, tried in all things to deport herself as formerly.

When Ishmael was able to sit up a little the craving for tobacco, that had left him while he was at his worst, began to return. He had a pipe. It had been in his pocket when he fled from the Hainings, but he had no tobacco. And one thing a discreet maiden-lady must not be seen purchasing is tobacco.

It was about this time that the tobacco-pouch of Mr Drummond, the parish minister, went amissing. On his return from a round of parochial visits—during which he had paid a ministerial call on Miss Robina Peebles—he had found the pouch gone. Two days later the pouch was discovered just inside the manse gate. When lost it had been well filled; now it was depleted of every shred of tobacco.

The matter afforded worthy Mr Drummond food for conjecture for some time. But though he advanced many theories to account for the odd disappearance and more inexplicable recovery, he never once thought of connecting either occurrence with the time when his overcoat hung on a peg in Miss Peebles's entry.

Necessity makes the brain fertile in expedient. It was shortly after that date that Robina began openly to buy tobacco with the avowed intention of bestowing it upon Johnny Wardrope, the bedridden cobbler who lived at the west end of the village; and if only half of the quantity she purchased reached old Wardrope, nobody was any the wiser.

As time went on the knee mended in so far that Ishmael might again use it. Still, the injury had left him incurably lame, and his increasing heart-malady proved a further handicap. So, while rumour conjectured him far from the scene of his crime, Ishmael Goudie spent his days hidden in the back attic among broken furniture and the discarded implements of occupations now almost forgotten.

In these days of enforced retirement and bodily weakness Ishmael found great solace in reading. He could always lose all sense of his irksome surroundings in a book; and when he had exhausted the scant literature of the cottage—he even read the love-tales in the fashion journals—Robina would borrow a bound volume of some magazine. Then there was the recurrent interest of the weekly newspaper, which he read from the first page to the last.

At night, when the village was asleep, he would steal downstairs and sit in the cheery kitchen beside the woman who was braving so much for his sake. On that dank November afternoon when Mirren Dawson paid her surprise visit he had slipped downstairs earlier than usual, and was sitting cosily by the kitchen fire when her peremptory knock made him hasten, panting and agitated, back to his attic.

Sometimes, as the months wore on, Ishmael found the inaction and imprisonment so irksome that he would rise before dawn, and, disguised in a waterproof of Robina's, with a shawl about his head and shoulders, wander in the garden. In these early morning hours of summer he even did some gardening, working in the border close behind the back-door, where he could not be overlooked, and raising many plants of auricula, wall-flower, pansy, canterbury-bells, sweet-william, mignonette, and sweet-peas. When he asked her to get him the seed, Robina wondered that most of the flowers he chose would not bloom till the following summer. Perhaps when he selected them Ishmael had it in his mind that he might do something to make her garden gay when he was gone.

Robina's thoughts were still far away when Dr Mickle put his head in at the kitchen door. 'I 'll be back in a minute. I 'm just going along for the minister,' he said.

'Oh doctor, is he *that* bad?'

'Ay, he 's about as bad as he can be. An' I dinna think even you would want to keep him suffering longer.'

'But is it safe?'

'It 's Ishmael that wants the minister. He wants Mr Drummond to marry you and him.'

A burning flush dyed Robina's pallid face. 'To marry me!' she breathed, as though news of some tremendous impending honour had just reached her.

'Yes; nothing 'll serve him but that he must marry you. And I must warn you that there 's not too much time. So I 'll run along now and get Drummond.'

'But, doctor, there 's been no banns put up. Would the wedding be legal if we werena cried first?'

'There 's nae time for cries, lassie. It 'll just ha'e to be an informal marriage, but perfectly legal in Scotland. We 'll have a paper signed, and all that. But I 'm just mindin' there would need to be two witnesses. I 'll do for one. Have ye a neighbour ye could trust to hold her tongue?'

Robina looked dubious.

'Well, never you fash. I 'll get somebody, never fear.'

When he had gone Robina sank on her knees beside the arm-chair. She wanted to pray, but her thoughts were too confused.

As Ishmael's malady had increased and the demands on her care became more exacting, she had gradually ceased to pay attention to her dress. But when she opened the door to the doctor and the minister, and to his student son who had come to act as witness, she presented an almost bridal appearance. A lace fichu decorated the body of her worn gown; white cotton gloves covered the hands that had wearied themselves in the sick man's service. On Ishmael's breast she had pinned a cluster of white sweet-peas.

In after years, when the story of Robina Peebles's self-sacrifice had become public property, young Drummond was wont to describe the scene of the wedding as the most impressive he had ever beheld, when, in the attic room, under whose low roof the visitors could scarcely stand upright, the dying murderer and the woman who had grown gray and wan in shielding him from justice took each other for better or for worse.

When the brief ceremony was over, and the bride and bridegroom were left alone, Robina sat on the floor beside Ishmael, holding his wasted hand.

She had spoken of having him moved downstairs to the kitchen bed, but at the suggestion Dr Mickle had shaken his head in silence. He had given her what remedy he could, and, promising to return before night, had hastened off to the gig that had waited so long. But Robina knew, without being told in so many words, that the end was very near.

Ishmael had refused nourishment, though he allowed her to moisten his dry lips with cold black-currant tea. Then they remained silent for a long time. Ishmael's eyes were closed, and she thought him asleep, until he spoke. 'My bundle—the bundle I had—when I came'——

'Yes, Ishmael, I ken where it is. Would you like to see it?'

He made a feeble gesture of assent. And from where it was hidden at the bottom of a trunk Robina brought out the parcel of charity clothes. It was all Ishmael had carried into his new life when he left the poorhouse. It was all he could call his own now that he lay dying.

Laying the bundle beside him, she opened it and turned over the garments with gentle hands. One stocking alone was missing. When Ishmael had fled from the Hainings it had slipped from the bundle, and long ago had been trodden into the mire of the farmyard. But the other articles —the glengarry bonnet, the shirt, the coat, the cravat, the little breeches that had excited Walter Goudie's mirthless laughter—were all there.

'You 'll put them in my coffin wi' me, Robina?' he whispered. 'I 'm thinkin' that if the Lord has mind o' what a puir wee freendless laddie I was, He 'll maybe no' be ower hard on me.'

She had brought a little warmed milk, but Ishmael was too weak to swallow. So they kept silence—waiting. Ishmael's eyes were fixed on the skylight, through which they had a glimpse of the glory of the setting sun. For a moment the reflection of the afterglow illumined his face, making it appear as though transfigured.

Then the radiance gradually faded, and Robina saw that Ishmael Goudie had made the great surrender.

THE END.

THE MONTH: SCIENCE AND ARTS.

A POSSIBLE SIDELIGHT ON THE CONGO ATROCITIES.

THOSE who have taken a profound interest in the toll of the rubber industry in the Congo State, and who have been considerably perturbed by the startling and terrible stories of fearful atrocities on the part of the authorities there, would find the paper dealing with 'Some Tribal Customs of the Nyam and Gour People Inhabiting the Eastern Bahr-el-Ghazal,' from the pen of Captain R. G. Anderson, R.A.M.C., Egyptian Army, which is published in the general science volume of the *Fourth Report of the Wellcome Tropical Research Laboratories at Khartoum*, highly interesting, as throwing a new light upon the question. Among the Nyam-Nyam tribe mutilation of the most terrible and drastic character was practised as a punishment for five classes of offences, comprising adultery and rape, intrigue against the life or property of a chief, refusal to obey a tribal call to arms, cowardice in face of an enemy, and neglecting to pay tribute of meat or corn to a chief. The right to inflict mutilation was in the hands of the sultan, and when the wronged man secured the requisite authority little delay ensued in putting the sentence into effect. The avenger gathered one or two colleagues and hunted the offender down. When caught he was immediately bound upright to a tree. Then with a knife the mutilation was carried out in the most barbarous manner, and often it was of the most atrocious character, comprising emasculation, the cutting away of the upper lip, both ears either entirely or partially, and both hands at the wrist. The last-named caused the poor wretch to fall forward on his face unconscious. Sometimes the fiendish treatment was accompanied by blinding. The wonder is that any of the mutilated survived the ordeal, but often they succumbed to the pain, shock, and loss of blood. Captain Anderson's paper is accompanied by photographic illustrations strongly reminiscent of the atrocities laid at the doors of the Congo officials, for they are of similar character. As a result of his investigations and conversations with the mutilated wretches he met, the writer imagines 'that many of the so-called Belgian Congo atrocities were due more to carelessness and inadequate supervision on the part of the authorities over a brutal and licentious savagery than to any gross inhumanity on their own part.' When British sway, as represented by the Soudan Government, penetrated the country these reprehensible practices were put down with a stern hand; but there is no doubt that they are practised still more or less by the tribes beyond the reach of the British officials. Strange to relate, men who had undergone, and had survived, the ordeals of mutilation were not regarded with disrespect by their fellows. As a rule they secured responsible posts in the households of the sultan and the family chiefs. The hands were always removed, since the man inflicting the punishment rightly concluded that one who had been mutilated and had his hands spared would develop into a desperate enemy. Yet, notwithstanding the terrible character of the penalty, Captain Anderson remarks that those who have been thus mutilated have by practice become very capable with their dismembered arms.

A WOODEN TIRE FOR MOTOR-CARS.

A well-known inventor, Mr John Henry Knight, the builder of the first two-seated petrol-car made in England, has devised an ingenious substitute for the rubber tire, which should be particularly serviceable for commercial vehicles. He has selected wood for this purpose, owing to its remarkable elasticity, which is strikingly illustrated in the archer's bow, which retains its original elasticity for half a century or more. Two years ago he evolved a tire made from ash, fitting it to an experimental wheel thirty-four inches in diameter, which without the intervention of any carriage-spring easily carried a load of four or five hundredweight. He found this to run over uneven road-surfaces and obstacles quite easily and without suffering any damage. Then he fitted up a similar pair of wheels which were used as drivers on his six horse-power Darracq. This vehicle has been in use for several months, during which time it has covered hundreds of miles over roads of all descriptions, with slight signs of wear; while as regards riding comfort and efficiency, the tire appears to be quite equal to solid rubber. The tire is built up of sections of ash bolted on the rim in two rows. If the vehicle is heavy the number of rows may be increased. The blocks of ash break joint with one another—i.e. the joint of one row is not placed over the joint of another row. In the ends of the blocks are saw-cuts, and a wedge-shaped piece is cut away to give additional elasticity. Before the blocks are bolted on the wheel they are bent, to a somewhat greater curve than the circumference of the wheel, by steaming. The blocks have steel cleats on them as a protection against being split by stones on the road. If one block is damaged it can be replaced in a few minutes. If a block is struck with a hammer the tool rebounds in the same way as if it hit a spring or a block of india-rubber. The cost of these wood tires, which are shortly to be placed on the market, is estimated to be from one-sixth to one-fourth that of rubber tires, so that if the wooden tires last only half as long as rubber ones they must represent a considerable

economy. It is expected that these wooden tires will overcome side-slipping, while they will go through sand or over soft ground where a rubber tire would be useless.

ADULTERATION OF LEATHER.

American footwear has long been denounced in this country for its short life and bad wearing qualities as compared with its British rival, and some interesting sidelights as to the causes of this defect have been published by the United States Bureau of Chemistry. It seems that the American leather-producing firms adulterate their goods very heavily, glucose being principally used for this purpose. The adulterant is either brushed over the surface of the material or added to it by a revolving drum. Epsom salts are often used for a similar purpose, as it is said to clear the grain and to render the article somewhat lighter in colour. When either of these specifics is employed, however, the serviceability of the material is seriously impaired and its waterproof qualities are destroyed completely. The addition of Epsom salts increases the weight of the leather very materially, but this result may be attained far more successfully and just as destructively by an excess of tannin. Leather so treated is at first somewhat watertight, but soon becomes hard and cracks easily owing to the tannin being washed out by use. Another common practice is to subject the leather to bleaching for the purpose of improving its appearance. Alkalis and sulphuric acid are used for this purpose, with somewhat disastrous results upon the material. Some of the free sulphuric acid is certain to be left in the substance, and in a short time it destroys the tissues, so that the leather breaks with little effort, while the alkalis cause the leather to become hard and be easily cracked and broken. It is obvious, therefore, that until American leather manufacturers abandon their adulterating processes and treat the material in a method common to Britain, American footwear will be regarded with suspicion. The longer life of the British leather and the retention of its natural characteristics are responsible for the increasing popularity of British-made boots and shoes in the United States.

A USEFUL TELESCOPIC LADDER.

An improved ladder of the well-known Heathman type has made its appearance, and it should prove highly useful both about the home and the estate. It is telescopic, is carried on a two-wheeled truck, and can either be extended from the truck itself (in which event no support against fixtures or walls is required) or it can be detached from the truck and carried to places where its wheeled carrier cannot enter, being supported against the wall in the usual manner in this case. It is handy for reaching roofs and high windows outside the house, and to the ceilings and electric lighting fixtures in a lofty room. Packing within small limits, it can be stowed away easily when not in use. In the garden it is equally serviceable, as it enables access to be had to fruit-trees and other elevations. Certainly no country house should be without one.

FIRST-AID OUTFITS.

This is the age of tabloids, and the first-aid outfits which have been devised by the well-known originators of this method of preparing medicaments indicate a new departure. The Burroughs-Wellcome equipments are designed to meet every requirement, from a small light case which may be slipped into the pocket, recommended for aviators and motorists, to well-stocked cases prepared for use in large engineering establishments, factories, and mines. The character of the outfit varies according to the price; but the larger wooden or japanned metal cases carry a full range of surgical instruments, plenty of dressings, ointments, and a wide variety of requisite tabloid specifics. Accidents are always liable to happen, and the mother in particular should be well supplied at home with the requirements for emergency cases.

SULPHALIUM.

The activity of the metallurgical chemist is revealed by the number of aluminium alloys which have appeared during recent years. The latest is sulphalium, for which the claim is advanced that it has twice the strength of aluminium and none of its disadvantages. The salient feature of this metal is the complete absence of zinc, which has entered into the composition of so many aluminium substitutes, and has proved ultimately to be the rock upon which the substitute has been wrecked. Atmosphere and salt-water, too, have no effect upon sulphalium; and these attributes alone should render it successful. It has the peculiar silvery lustre of the metal it is intended to supplant, works well on the machines, and can be filed and cast. It should prove exceedingly useful for airship construction (where lightness with great strength is required) and electrical work, while it has been found highly serviceable for the manufacture of scientific instruments.

NEW ELECTRIC LAMP FOR MINERS.

A new electric lamp suited to the use of miners has been devised by Mr Sherard Cowper Coles, the well-known inventor. It has several novel features. It gives a two-candle power light for about ten hours, is fitted with two electric incandescent bulbs, and is provided with special screens, so that should the lamp break there is no danger of inflammable gas being ignited. One bulb is designed to give a diffused light, while the other is placed in a parabolic golden mirror, and enables a concentrated beam

of yellow light (which is not trying to the eyes and does not cast deep shadows) to be thrown in any desired direction. The complete weight of the lamp is stated to be about four and a quarter ounces.

ABOLISHING THE POSTAGE-STAMP.

An interesting attempt is being made by the postal authorities to avoid the waste of time incurred in stamping letters. A simple small machine was set up in the London General Post-Office wherein, instead of a penny being inserted in the slot for a postage-stamp, the letter and a penny are both posted at the same time. The letter is then franked with a post-mark, the familiar postage-stamp being dispensed with. Although this idea is somewhat new to Britain, it has been in service in New Zealand for some time; and, as the initial experiments have proved successful, there is every indication that it will be extensively adopted in that country, for letter-posting at all events. It means not only a considerable saving in time in busy post-offices, but at the same time represents an appreciable economy in the maintenance of the department, as the expense of manufacturing adhesive postage-stamps is saved if the invention is adopted extensively. Philatelists may be disposed to deplore the disappearance of the postage-stamp; but it will cause no misgivings among commercial men, among whom the adoption of such a device has been advocated for some time past in order to save time, and to prevent pilfering of stamps.

POWER FROM PEAT.

An interesting plant is working at Portadown, in Ireland, for the manufacture of gas from peat for power purposes. The installation is of four hundred brake-horse-power capacity, and it works upon the simplest principle. The peat, which is delivered to the plant at a total cost of about six shillings per ton, is charged into feeding-hoppers at the top of the producer, falling towards the bottom by gravitation as the fuel beneath is consumed. As the gas is formed it passes through a coke scrubber to an extractor, where the tar is separated from the gas, which makes its way thence to the sawdust scrubber, where it is finally cleaned and cooled, afterwards to be delivered into a gas-holder. The peat used in this plant is cut by the ordinary open-air method from the Maghery boglands, and the open-air drying under normal summer conditions suffices to evaporate all but 26 per cent. or so of the moisture. The average consumption of peat per week is about twenty tons, representing a cost of some six pounds, the plant working on a load of two hundred and seventy-five brake-horse-power on the average. If we deduct the value of the tar obtained (representing thirty-five shillings), the net cost of the fuel comes out at four pounds five shillings per week. The plant is working smoothly, and has been found to be completely successful. It ranks as an interesting attempt to utilise peat directly for power purposes, and should serve to assist in solving the vexed problem of making economical use of the vast stretches of peat-land to be found not only in Ireland but in other parts of the world.

A TRAVELLING KINEMATOGRAPH HALL.

Seeing that moving pictures at the present moment are such a rage, the experiment adopted by an enterprising French showman might be emulated very advantageously in these islands. Certainly it would enable the few inhabitants in the many scattered villages to be introduced to the latest marvel of science. This Gallic showman has acquired two motor-omnibuses from the firm of De Dion Bouton. Externally they resemble the vehicles common to the streets of our cities. When a village is reached the tent is run up on the lines of our travelling circuses, and the engines of the omnibus vehicles are pressed into service to drive the electric lighting equipment for the interior and façade of the canvas hall, as well as for the projector. This showman wanders up and down the country delighting thousands of villagers, and, being without that severe competition which is now rife in the towns and cities among the picture palaces, profits accordingly. Thus he introduces animated photography to delighted crowds of rural folks far removed from the towns, who otherwise might be denied a taste of this most modern form of amusement. Travelling kinematograph shows have been attempted in this country, but have met with indifferent success, for the simple reason that the effort has been made upon antiquated lines. This ingenious Frenchman is able to provide his patrons with a picture as large and steady as, and in fact equal in every respect to, those seen in substantial buildings in town.

EXPERIMENTS ON OIL-MIXED CEMENT, MORTARS, AND CONCRETES.

In our volume for 1911 (page 768) reference was made to a new waterproof cement. Through the courtesy of Mr Paul D. Sargent, acting-director of the United States Department of Agriculture, Office of Public Roads, in Washington, we are enabled to give some fuller details of this invention: 'It was found in 1910 at this office that almost any oil could be mixed with Portland cement after it was thoroughly wet, the oil combining with the cement and quickly disappearing throughout the mixture. This was also found to be true of mortars and concretes. In adding the oil to mortar, the cement, sand, and water are mixed together as in ordinary mortar, the oil being the last ingredient added. Oil-mixed concrete is best made by mixing the cement, sand, and water to a mortar, adding the oil to the mixture, and mixing until the oil is thoroughly incorporated. This oil-mixed mortar is then combined with the previously moistened

coarse aggregate. Tests have been made on the compressive strength of oil-mixed mortars and concretes in comparison with plain mortars and concretes, which show that oil-mixed concrete gains in strength with time, this being true of both air and water cured specimens. In May 1911 streets were constructed of oil-mixed concrete, one in New York City, one in Washington, and two bridge surfaces in Ridgewood (New Jersey). A vault one hundred and five feet long by eighteen feet wide was constructed in the American Treasury Department of this material. The top was a flat reinforced concrete arch, and as sufficient tests in bond had not been made, ordinary concrete was used to surround the reinforcement. After it had set, three inches of a 10 per cent. oil-mixture was placed above. The vault has been perfectly waterproof under very trying conditions. A large water-tank constructed in our laboratory with a 10 per cent. oil-mixture is absolutely waterproof. Extensive experiments made with oil-concrete in basement floors have given excellent results up to the present time. The oils that have been used to date have been non-volatile petroleums with flash-points at least three hundred and fifty degrees.' The caution is added that, 'in view of the incomplete character of the tests now being conducted, it is not recommended that this material be used where life and property are endangered.'

THE GLASTONBURY LAKE-DWELLERS.

Under the above title Mr Charles Edwardes contributed a paper to this *Journal* in 1896, giving an interesting narrative of finds and excavations up to that date in connection with the Glastonbury lake-dwellers, with a description of their relics then collected in a room at Glastonbury. The discoveries from 1892 to 1907 have been recorded by Mr A. Bulleid and Mr H. St George Gray in a volume entitled *Glastonbury Lake Village;* and there is another volume still to come. Commenting on the first volume, a writer in the *Athenæum* recalls how Mr Bulleid, in March 1892, was walking along the road from Glastonbury to Godney, in Somerset, when he observed some shallow mounds, which, being interested in the subject, he identified as remains of early lake-dwellings. Digging was begun here, with the permission and support of the proprietor of the land, Mr Bath, of the Glastonbury Antiquarian Society, and later of the British Association. An early discovery was a splendid canoe neatly formed out of the trunk of a single tree. It was ultimately shown that, at a time in the early Iron Age, about two thousand years ago, just before the Romans arrived, a party of inhabitants of what is now Somerset occupied ninety separate huts, and probably numbered three hundred persons. They established themselves on a triangular piece of ground measuring about four hundred feet by three hundred feet, and well protected by water. Upon this peaty soil had been laid down a timber foundation, supporting layers and mounds of clay, on which their dwellings were erected. The village was surrounded by a continuous line of palisades. The huts were nearly circular, and varied in size from twenty to thirty-eight feet in diameter. Each had a central hearth formed of slabs of stone or baked clay. One of the mounds, on digging down, was found to have ten floors and eleven hearths, one over the other. From slight remains of the people themselves, it is found that they were part of a long-headed race. Amongst the relics and remains recovered were a hammered bronze bowl, bone needles, pottery, fragments connected with a loom, parts of a crucible, a wheel hub, and a ladder. There were also found grains of wheat, barley, peas, and bones of the ox, sheep, goat, pig, horse, dog, fowl, stag, beaver, otter, pelican, and swan. When the full record is issued we shall have a valuable addition to our knowledge of the early inhabitants of this country. As has been pointed out, Cæsar's statement that the inhabitants of the farther parts of Britain were in a social state not far removed from barbarism is without foundation; so that the woad-painted savage of the histories is not entirely a type of the ancient Briton.

To Correspondents who wish fuller information regarding new inventions mentioned here, addresses will be furnished, when possible, provided a stamped and addressed envelope or post-card be sent to the Editor, 339 High Street, Edinburgh.

FROM THE HILLS OF DREAM.

AT dawn I kiss the stars with my lips,
And dip my face in the blue sky-stream.
I play with the clouds for sailing ships,
For I live on the Hills of Dream.

I stride to the east to greet the day,
And set a light to the sleeping sun;
And I snatch his first gold flame away,
And clasp it close to my heart, and run.

I make sweet tunes with the hill-top flowers,
And cool my hands in the mist at noon;
And I splash the earth with mist-spray showers,
And whisper at evening to the moon.

Sometimes I speak with the valley men,
And they scoff, and say, 'Your dreams are vain;'
But I look into their eyes, and then
I fly to the hills, and dream again.

THOMAS MOULT.

*** TO CONTRIBUTORS.

1*st*. All communications should be addressed 'To the Editor, 339 High Street, Edinburgh.'

2*nd*. For its return in case of ineligibility, postage-stamps should accompany every manuscript.

3*rd*. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, *should have the writer's Name and Address written upon them* IN FULL.

4*th*. Poetical contributions should invariably be accompanied by a stamped and directed envelope.

Printed and Published by W. & R. CHAMBERS, LIMITED, LONDON AND EDINBURGH.

SOME ADVENTURES OF SERGEANT SPARKS, OF THE MOUNTED POLICE.

By Reginald Horsley.

I.—WHISPERING DEATH.

YOU may remember that on the night when Ted Flower tried to stick-up Toomburra I shot him under Squire Ingram's window. Within a month every member of his gang was dead or in prison, with the exception of Bobby Pollet, who—unsuspected by all—had been Flower's trusted spy, and without whose help the bushranger's greatest raids could hardly have been carried out.

An innocent-looking pedlar, arriving at a station like any other 'sundowner,' Pollet would beg for a shakedown, and get it, with a good meal thrown in. The place which thus hospitably received him would be 'stuck-up,' perhaps that very night, while dead dogs and drugged stockmen testified to Bobby's cleverness in arranging matters for his cousin Flower. Since Pollet invariably made one of the hocussed men, and as his pack always appeared to have been rifled, it occurred to nobody to connect his presence with the visit of Flower and his gang.

I had never liked Pollet, who was furtive of eye and oily of speech; but it was not until he disappeared from the district after Flower's death that it struck me that the fellow might have been scared away. When three months passed and he still did not return, suspicion deepened; but it never became certainty, nor on searching his hut did I find anything there connecting the man with Flower.

Enlightenment came one night when, after a very tiring day, Tom Foster, Sandy Macneil, and I returned to our quarters in Bildarong township. We were about to enter by the back-door, when Foster, who was leading, pointed to a white patch clearly visible on the dark panels.

'Didn't you stick the notice of our absence on the front-door, Sandy?' he said.

'Ay!'

'What's it doing there, then?' began Tom; when I reached over his shoulder, detached the paper, and carried it into the kitchen. Sandy struck a match and lit the lamp, and as he turned away to prepare supper I read aloud:

'Sergeant Sparks, your time is nearly out; but before you die you shall learn something of what the hunted feel. Three times in the moonlight you will see the dancing shadow and hear the whispering death. The third time ends you. The Avenger.'

'Some lunatic's idea of a joke,' I said; and Sandy, busy toasting rashers, observed, without turning his head, 'It's no' likely.'

'Well, it's not worth worrying about,' I said with a laugh.

'Why shouldn't it be?' Tom Foster burst out. 'You have enemies enough, my word! How do you know that the writer isn't related to some rascal you've downed in fair fight?'

'Ay!' agreed Sandy, dishing up. 'Hold on while I mask the tea, an' I'll tell ye a tale.' He drew his chair to the table with the deliberation which always fidgeted excitable Tom, and resumed in his Lowland drawl, 'Efter I left you twa this efternoon I passed Maginty's old bush-inn, an' my thochts turned on yon missin' pedlar. That wasna' wonnerfu', considerin' hoo aften he used to be drinkin' there.' He pushed a cup of tea across to me and another to Tom. Then he took a big drink from his own cup. 'Man, that's fine!'

'Do get on with your yarn,' Tom growled.

'The feelin' was that strong on me that I dismounted an' entered the bar,' Sandy resumed without haste. 'My mither, as I've telt ye, had a graun' gift o' second-sicht, an''—— Foster groaned, and the flicker of a smile stirred Macneil's moustache. 'Weel, it doesna matter. The place was much as we left it when we took Maginty for receiving Flower's loot; but I found something. There it's.' He handed me a soiled and crumpled piece of paper.

'Why, it's a letter, signed by Flower!' I exclaimed.

'And written to Bobby Pollet, by George!' cried Foster, who was reading over my shoulder.

'Right, Tom,' I said. 'The letter refers to the sticking-up of Tyndall's station. Bobby was there that night, and this makes it clear that he was working with Flower. How the rascal has taken us in!'

 [*All Rights Reserved.*]

'Pollet must have pinned that paper upon our back-door,' bubbled Tom.

'Maybe he did. All we know is that one survivor of Flower's gang remains at large—the bushranger's cousin Pollet. We may conclude that he does not love me for the share I had in his leader's death.'

'I looked in at his hut,' Sandy told us. 'I saw nae signs o' recent occupation.'

I pushed back my chair and rose. 'Boys, I 'm going out.—No, Tom, don't come with me.' Without waiting to be questioned, I left the room.

My object was to look for traces of our visitor, and, as I found none in the yard, I passed into the paddock, where, fifty paces farther on, I picked up a cap. It was a peaked, cloth affair, common enough upon loungers about the wharves, but an uncommon headgear in the bush, where the slouch or the cabbage-tree hat is almost invariably worn. I knew only one man in our district who wore such a cap, and he was Bobby Pollet. I saw at once that the cap had been deliberately dropped, so that I might be sure that Pollet had affixed the note to our door. I smiled at the thought of the fellow's slyness; for I knew that I was acting just as he would have had me act. Had he signed the paper I should have stayed indoors. As it was unsigned I did as any trooper would have done—came out to look for the writer.

Beyond the paddock, a flat stretched north for about three miles; but I had no intention of crossing it in pursuit of my man. I merely meant to go on for a little on the chance of nabbing him if he should be lurking to do me a mischief. Yet I did not see how this could be possible; for the ground was sparsely timbered, and the grass not long enough to afford cover.

But a fairly large bottle-brush tree grew about eighty yards to my right front; and as I realised that if Bobby were behind it, waiting for a shot at me, I presented a very good mark in the moonlight, I concluded to go back. I was in the act of turning when I heard—something.

There are many things one recognises readily for what they are which are extremely difficult to describe in words. Such was the sound I heard, though I must try to make it plain to you.

You know what night is like in the bush. You are aware of that deep silence of God's great spaces which can be felt, and which, if it be broken by an unaccustomed little sound, leaves you startled, quivering, almost afraid. The overpowering, awful silence seems to warn you of an impending shock, and yet to take away your power of resistance when the shock falls. The loud crashing of a wild bullock through the scrub, the howling of a dingo, the thumping of a mob of kangaroos in flight, come as a relief; but the soft sounds, the seemingly causeless sounds, hammer at your heart more violently than if a lion roared in your ear.

So it was with the sound I heard. Coming in the midst of the silence, it shocked me. I felt my nerves thrill. Yet the sound was not wholly unfamiliar. It resembled, but only at first, the sound made by a bird flying overhead at night; you can't see the bird, but you can hear the *whish-whoosh* of its wings. You see now how difficult it is to describe in words some very familiar things. The nearest I can get to a description of the sound is that it resembled the whispering of wings.

So I told myself then, and there instantly recurred to me the message, 'The whispering death!' and these words stuck in my brain, and I wished that I had turned round, so that I might have had the faint consolation of seeing the distant light in our quarters. But I stood there as if glued, while the eerie whispering continued, so like a passing bird, and yet so unlike. For the bird passes and the sound dies; but this chilling whisper never ceased, nor, though always overhead, did it remain in one place. It was now in front, now to my right, then behind, now to my left, then in front again, and so on, circling, circling, and, worst of all, coming nearer with each passing second.

I was frightened. I say it. I am not a coward; but I was frightened, for these words, 'the whispering death,' would keep sounding in my brain. The noise at one moment came so near that I almost sprang backwards; but luckily I kept still, for if I had moved I should not be telling this yarn. No, I won't explain yet. My feet did not move, but I shivered as that awful whisper circled round me, seeming to repeat incessantly, 'Death! death!'

Then, oh blessed relief! as I stood, dully wondering what would happen next, I realised that the horrid sound was a little farther away. It was right, left, in front, behind, as ever; but it was farther away.

'Thank Heaven!' I muttered. Then my nerves thrilled once more; for I recalled the words of the threat, 'the dancing shadow and the whispering death.'

There it was, a queer, flickering shadow, never for an instant still, and, like the whisper, ever circling round me. I should have observed it earlier but that the whisper had engaged my whole attention. It disappeared, danced into view, and disappeared again, and all the while went on that ever-receding whisper, 'Death! death! death!'

But I began to breathe freely. The shadow was dancing farther away with each revolution, and presently vanished. I could still faintly hear the whisper; but the sound suddenly went out—there is no other word for it.

Relieved! I should say so. I counted a hundred to make sure that the ghastly pair did not intend to return, then wheeled and raced

back to quarters. As I ran a deep voice boomed after me, 'Once! Beware the shadow and the death—the whispering death!'

The sound of that voice braced my quivering nerves. I forgot my terrors and remembered only that I was dealing with a man, and had been the victim of a trick. How the trick had been worked I could not imagine; but I called myself names and slackened my pace to a walk.

I got in and told my story, and Tom Foster shook his head. 'It may be a trick,' he said glumly; 'but I can't see how it 's done.'

'Is that a fac'?' murmured Sandy, and Tom joined in the laugh against himself.

'Never mind, old fellow,' I said; 'if you are not much good at mysteries, you are the man for us when it comes to hard knocks.' To which Sandy heartily assented with his usual 'Ay!'

'Call me when they 're due, and take care of yourself; that 's all I ask,' returned Tom, looking pleased.

Two nights later the impression made by my singular adventure had largely faded, and I announced at supper my intention to try for a few duck in the lagoon, as we called the swamp and waterholes which fed Bildarong Creek. Macneil, who was alone with me, said nothing; but his face expressed anxiety.

'I 'll be careful,' I promised, knowing what was in his mind. 'I shall not go farther than the bend of the creek; so, if I am wanted, one of you can ride after me. Tom will be back soon.'

'Sergeant, I 've been thinkin' ower yon uncanny business,' Sandy said, rumpling his fair hair with outspread fingers, as he always did when anything annoyed him. 'I canna mak' heid nor tail o't; I 've thocht an' thocht an''—— He broke off as if a hand had been clapped over his mouth; his eyes, fixed and motionless, stared at a point beyond me. The pupils were dilated, his lips open, but no word did he say; but sat rigid, white, and insensible of my presence. He looked like a man I had once seen in a cataleptic fit.

'What is the matter?' I cried, springing up; but before I reached him the glare went out of his eyes, his features softened, and, with a sigh, he passed his hand across his forehead. 'What is the matter?' I repeated. 'Are you ill, old fellow? You look as if you had seen a vision.'

Sandy came fully to himself. 'I maybe have,' he said quietly, giving me a peculiar look. 'See here, sergeant,' he went on very earnestly, 'I 'll no' speak until I 'm shair; but mind ye this: if ye hear that whisper an' see yon shadow, dinna move back or forth or from side to side a single step. Much may depend upon it.'

'How much?'

'Your life,' he answered gravely; and, as I could get no more out of him, I set off. The bush thins considerably as the lagoon is approached, and the ground for a couple of hundred yards is bare of aught but decaying stumps and dwarfed new growth. One has to go warily across this strip, or the chance of a decent bag is small.

I was about to crawl into the open, when forty or fifty duck rose from the water and flew away in a tremendous hurry. I knew that they had been frightened, for they did not circle and settle again, but flew out of sight down the creek. I knew, too, that somewhere in the swamp lurked the man who had startled them—the man who must have watched me as I left home, marched parallel with me, and stolen ahead to the lagoon before I could get clear of the trees.

'It is you or I for it, Bobby!' I muttered, as I began to wriggle across the clearing. Before I had covered half of the distance I heard for the second time that deep, booming voice: 'Twice! Beware the shadow and the death—the whispering death!'

I sprang up, intending to take chances and run the rascal down; but as his voice died away that strange whispering began again, and Sandy Macneil's odd warning flashed across my mind. I knew that he would not have spoken without good reason; so I stood still and listened. But my gun was ready, in case substance as well as shadow happened my way.

The fearsome whispering and the mocking shadow had not the same malign influence over my nerves as on the first occasion; but there was nevertheless something so ghastly, not to say ghostly, about the combination that I had to keep the idea of a trick well to the front of my mind. I had besides been warned that the phenomena were to end in the death of the observer—me—so I can truthfully say that I was far from regarding the situation with the unconcern ascribed in story to the bold trooper.

The whisper and the shadow having played their part, I moved in the direction of the voice, not troubling that I offered a very fair mark; for I was persuaded that Pollet would make no attempt upon my life until he had caused me to suffer the protracted suspense which he had threatened.

Had the man been anywhere on the near margin of the lagoon I must have seen him; had he moved I must have heard him; but as neither happened, I made for the point where the creek issued from the lagoon, for the cover began again there, and increased in density with the southward trend of the stream.

'He is there!' I thought, and strode swiftly across the open, to be brought up by an imperative 'Halt, or you are a dead man!'

My right foot swung back in line with my left. I was certain that rifle or revolver covered heart or head, and saw no reason to challenge death.

The deep voice spoke again: 'Sparks, you have not long to live; but if you stand there

for five minutes you will take no harm—to-night.' The pause was full of significance.

'Who are you?' I called out.

'The avenger of blood!' answered the unseen. 'You have known fear, but not enough. Wait until you hear the whisper and see the shadow for the third time.' Here followed a harsh chuckle. 'Hunter of men, you are doomed!'

'And you are crazed, I should say,' I retorted, and rushed forward, running zigzag, so as to confuse the fellow's aim. But no shot came, nor any sound of retreating footsteps. Instead, a squeal of maniacal laughter rang out far behind me. I heard the sound of galloping hoofs, and knew that I had been fooled again. But how? Was Pollet a clever ventriloquist? It looked like it; for I could have sworn that the man with the deep voice had stood in front of me. However, the cackling lunatic behind me was obviously one and the same with him, and in a somewhat crestfallen mood I went to the tree at whose foot I had left my belt and bag.

A bit of paper was pinned to the bark, and I read by the light of a match these complimentary and reassuring words:

'Fool! your puny intellect can never equal that of him whom you will never catch, and who will certainly kill you.

'BOB POLLET THE AVENGER!'

'This settles it,' I muttered. 'The one point upon which I am undecided is whether the fellow is all mad or part mad.'

(To be continued.)

OLD BENGAL.

By Colonel HUGH PEARSE, D.S.O.

WHEN the Bengal army committed suicide in the year of sorrow (1857) it had existed almost exactly a century. There were brave men before Agamemnon, and good soldiers had fought for England in Bengal before Clive hurried up from Madras to scatter the hosts of Siraj-ud-Daulah and avenge the horrors of the Black Hole; but there had been no Bengal army until the heaven-born General took charge of affairs in the north. In fact, when Siraj-ud-Daulah fell upon Calcutta in June 1756, the military establishment of Bengal consisted of but one company of artillery and five of European infantry, with a few hundred undisciplined native soldiers armed after the manner of the country. Moreover, this meagre force was scattered broadcast for the defence of the company's trading stations. So it followed that 1756 was a year of disaster, and the weak posts of Bengal went down one by one before mere weight of numbers.

Clive, as we know, with the handful of white soldiers and disciplined sepoys who accompanied him from Madras, quickly retrieved the situation; and when, in January 1757, Calcutta had been reoccupied, he set about expanding this band of veterans into a small but effective army. So quickly did he work, and so good was the material that he found to his hand, that in June of the same year two thousand sepoys stood up to the guns at Plassey. Clive, then, was the father of the Bengal army, and his children were of many tribes and creeds—Pathans, Rohillas, Jats, Rajputs, and Brahmans. None, however, were of the unwarlike races of Bengal itself, though two early writers, Hamilton and Bishop Heber, have erroneously stated the contrary, and their mistaken statement has been eagerly repeated in recent years by the Bengali press.

In the days of Clive the establishment of a sepoy battalion included but three white officers—a captain, a lieutenant, and an ensign. The native officers, on the other hand, were numerous and highly considered. There was a native commandant who took his place in front of the line with the English captain, and a native adjutant who stood in rear with the white subalterns. The battalion consisted of ten companies, two of which were grenadiers. Light companies were a later development. Each company had a *subadar* or native captain, three native lieutenants, five sergeants, four corporals, two drummers, a trumpeter, and seventy sepoys. The drum was the native tom-tom, that small but effective instrument of torture that lends an added terror to Indian hot-weather nights. Each company had a colour, matching the facings of the battalion, and bearing the device of the *subadar*, such as a sabre, a dagger, or a crescent. The grenadier companies bore as a distinction the British Union-jack in the upper corner of their colours. All movements were performed to beat of drum, a system which sometimes led to mistakes in action; and the whole organisation of these native battalions showed a blending of native and English methods, with the latter element rapidly superseding the former.

Discipline was from the first sternly enforced, sometimes by strangely barbaric punishment. In 1772 Captain Richard Ewens, the commanding officer of the first battalion of the Tenth Regiment, was shot dead on parade during an inspection by Captain Camac, the senior officer of the district. When the murder took place Captain Ewens had just put the battalion through the manual exercise, which was then performed six-deep. The battalion was reforming to deliver a charge, when a sepoy, who had fallen out, walked deliberately round the flank of the battalion, with his arm recovered,

as if to ask leave to quit the ground, and shot Captain Ewens at a distance of two yards. On Captain Ewens falling from his horse, the nearest men rushed forward to avenge his death; but Captain Camac quickly ordered them back to the ranks, saying that justice should be done.

Directing the Tenth Regiment to stand fast, Camac then sent for his own battalion, and on its arrival ordered a drum-head general court-martial to try the murderer, who was immediately sentenced to be drawn asunder by horses. 'The horses,' says the chronicler of this ghastly episode,* 'being fastened to his limbs, many attempts were made to draw them from the body, but without effect; and then the sepoys were allowed to put him to death, which they did with their swords.'

The murderer, it may be added, committed the crime for the purpose of revenge, he having been reduced by court-martial from the rank of sergeant.

The indignation of his men at the death of Captain Ewens, and the terrible punishment awarded to the murderer by his own countrymen, testify to the high esteem in which this particular officer was held; but such sentiments were common, and were often shown in a touching manner. On more than one occasion, it is recorded, high caste native officers carried to the grave the dead bodies of their English officers; and it is impossible to imagine stronger testimony to the soldierly worth of both parties.

The action of Korah, fought in 1776, was of so dramatic a nature, and is so nearly forgotten, as to merit description. At this period the Bengal army had grown to a strength of three brigades, the second of which had for two years been stationed at Cawnpore, in Oudh, in support of the authority of the Nawab-Wazir, as the ruler of that province was then styled.

In May 1776 two battalions of native infantry and four guns marched from Cawnpore, under Colonel Parker, to watch the motions of a certain Mahbub Khan, a disaffected officer of the Nawab-Wazir who rented the district of Korah, about twenty-five miles south of Cawnpore, and commanded a force of seven battalions and nineteen guns. The odds were formidable; but Colonel Parker, on arriving near Korah, at once marched by night up to the position held by Mahbub Khan's troops. At daybreak on 10th June 1776 Parker found the rebellious governor's troops drawn up in his front at a distance of about a mile, their guns in the centre, with four battalions on the right of them and three on the left; the flanks were advanced so that the formation nearly resembled a half-moon. Colonel Parker immediately put his two battalions in order, and marched forward in columns. Mahbub Khan was not present; but the next in command, not suspecting the colonel's intention to attack him, fired a salute of nineteen guns, of which, however, Colonel Parker took no notice, but marched on until he came within fifty or sixty paces of the Oudh troops, when he beat to arms, and the divisions doubled up on the left and formed line facing them. Parker then, with his interpreter, advanced into the space between the opposing lines and called for Mahbub Khan's representative, who moved forward to meet him and desired to know his commands. Parker demanded the surrender of the guns; but Mahbub's officer said that he could not surrender them without the consent of the commander of the artillery, who, being consulted, declared 'that he had lived a man of honour for more than forty years, and that he would not disgrace himself by giving up what had been entrusted to his charge.' Parker then gave the two native officers half-an-hour to consider the matter, and immediately pulled out his watch, which he held in his hand. Both sides stood ready for the contest.

At the expiration of the half-hour, no reply having been given, Colonel Parker very deliberately told his orderly drummer to beat 'the general,' which was the signal to open fire, 'when a salute of round and grape was thrown in, and the battalions gave their fire by subdivisions with as much regularity as if it had been a field-day.'

The Oudh troops returned a warm fire, which, at such close quarters, inflicted heavy loss on the little Bengal force, Colonel Parker's interpreter being shot dead by his side; but before the enemy could load again Parker ordered his battalions to charge with the bayonet. This decided the day, the Oudh regiments flying in every direction, and leaving their guns behind them. One of Colonel's Parker's battalions which particularly distinguished itself was given the badge of a cannon, to be worn on their turbans, and both battalions were permitted to bear the honour 'Korah' on their colours.

Colonel Parker did not long survive his exploit, being killed in action in Western India in 1781, when covering the rear-guard in a disastrous retreat.

Some admirers of the hardihood of our ancestors would have us believe that they passed through the Indian hot season with impunity. This was, however, by no means the case, the mortality in exceptionally hot or unhealthy years having been terrible. At the period of which we write it was the general custom of the officers of the Indian Civil Service to abandon their houses during the hot weather, and to live in the groves of mango or other trees possessing a thick foliage. The year 1766 being extremely hot, Sir Robert Barker, who commanded the Third Bengal Brigade, stationed at Allahabad, ordered the European battalion to leave the fort

* *Historical Account of the Rise and Progress of the Bengal Native Infantry*, by Captain Williams. (John Murray, London, 1817.)

and to occupy temporary barracks which he had had built in a mango-grove near the Jumna. In spite of this precaution, the battalion lost seven officers and nearly forty private soldiers in the month of June. Five of the officers died in one day, and Captain Williams thus describes the incident: 'The troops had been out that morning (June 10th) to attend an execution. Eight men had deserted from the regiment, and when taken were tried and all sentenced to die. Two of them, being English, were to be shot, and the other six, foreigners, to be hanged.' A curious distinction. 'General Smith, the commander-in-chief then at Allahabad, pardoned six of them, but they were to take it by lot of a single die, and it fell on two foreigners, who were immediately executed. Before it was over it was past nine o'clock, and the sun powerful to a degree. Lieutenant Roberts, on returning to his tent, feeling himself excessively warm, ordered a few pots of cold water to be thrown over him, which checked perspiration and brought on a high fever that terminated his existence in less than an hour. On the report of the surgeon-major that the body would not keep, Colonel Grant ordered it to be interred immediately; and, it being Ensign Cleland's turn of duty, he was ordered to attend. On his return he was himself taken ill, and before two o'clock was a corpse. Ensign Morrison, who was upon the most intimate terms with Mr Cleland, not having heard of his death, ran into his tent to speak to him, and, seeing his friend dead, fell down in a fit. He, however, recovered, and was taken to his tent, when he begged to be removed to the fort. His request was complied with, and Ensigns Kitchen and Buchanan, who were his shipmates, accompanied him there in the cool of the evening; but they all three died in the course of the night.'

We turn again with satisfaction from this gloomy scene to the battlefield, choosing for description the fierce fight that occurred in October 1794 against the Rohillas, the peaceful shepherds of Lord Macaulay's imaginative pen.

The battle of Bitaurah was not the first occasion on which the army of Old Bengal encountered the Rohillas; but the action of St George's day, twenty years earlier, had been a mere cannonade in which superior armament won an easy victory. Far otherwise was it at Bitaurah. A few words will explain how this battle came about. Sir Robert Abercromby, brother of the better-known Sir Ralph, had recently been appointed commander-in-chief in India, and was paying a visit of inspection at Cawnpore when a disputed succession to the *gadi* of the state of Rampur caused an insurrection which assumed dangerous proportions. Sir Robert Abercromby at once took the field with the troops at his disposal, and marched into Rohilkhand, his little army consisting of two weak regiments of cavalry, a few guns, and three brigades of infantry. The few gunners of the artillery and the Second Bengal European Regiment were the only white soldiers in the force, whose total strength did not exceed six thousand men. Abercromby found the Rohilla army strongly posted about the village of Bitaurah, nine miles north-west of Bareilly, and advanced at dawn on 26th October 1794 to attack them, deploying two brigades to form the first line, with the guns distributed among the battalions, and holding the reserve brigade and the cavalry in the second line. No sooner had the little British force advanced into the open than the Rohillas, relying on their numbers, advanced confidently to meet them. They were indeed a great host, estimated by subsequent inquiry at twenty-five thousand men, of whom four thousand were cavalry.

Fearing to be enveloped, and trusting in the superior discipline that had so often triumphed in Indian battle, Abercromby moved his reserve brigade up to the right of his line and the cavalry yet farther to the right, so that his whole force was in a single line, only three-deep. The enemy's mounted troops, still gallantly coming on, were now rapidly approaching to within effective range, and the British line with equal confidence advanced to meet them. The Rohillas were formed in a long line of columns, about fifty-deep, the footmen closely following the cavalry, all shouting their war-cries and tumultuously waving sword and spear. The scene was a thrilling one.

General Abercromby's small cavalry force was now ordered to charge, and, bringing up their right shoulders, came presently directly in front of the right (reserve) brigade; but, either from a sudden panic or, as was alleged, in consequence of a wrong order, suddenly wheeled about, and, hotly pursued by the Rohillas, dashed into the Thirteenth Native Infantry. Captain Norman M'Leod, who commanded the battalion, promptly ordered his men to fire into friend and foe; but before the order could be executed the mass of mounted men burst into the Thirteenth, and a scene of wild confusion and slaughter followed. The English officers of the Thirteenth fell to a man, killed or desperately wounded, and the whole of the right brigade suffered heavily. The Rohilla leaders took full advantage of their opportunity, and, at the head of their infantry, charged into the swaying, shouting mass of combatants.

Now, however, came the triumph of discipline, for the centre and left brigades marched steadily on, and, wheeling against the Rohilla right, shattered the masses of the enemy with their fire, and then, charging with the bayonet, drove the wild Pathans in confusion from the field.

The loss sustained by Abercromby's force in this stern combat was severe, three hundred and fifty-two men being killed and two hundred

and eighty-two wounded; the proportion of killed being naturally very heavy. Of the small number of British officers present thirteen were killed and as many wounded.

A singular incident followed the disaster to the cavalry. The unhappy commanding officer, whose error or failure of nerve made him responsible for the false move that had so nearly caused an irreparable defeat, overwhelmed by his misfortune, rode straight off the field and disappeared. It is said that he made his way to Bombay, and, arriving there before the news of his desertion, was able to take ship and make his escape from India. He subsequently entered the service of Napoleon as a non-combatant, but as to the termination of so strange a career history is silent.

There is something very fascinating in the story of this eventful fight of the brave days of old: the confident advance of the little Anglo-Indian army in its hazardous formation, the wild, fanatical rush of the great mass of Mohammedan swordsmen, the momentary panic of the newly raised and weak native cavalry, and the grim, determined stand of the shattered right brigade; at last the triumph of discipline, the flight of the brave enemy after the repulse of their 'Highland charge,' and the loud shouts of 'Victory to the Honourable Company!' that marked the close of this stern struggle.

Bitaurah was the last of the battles of Bengal in the eighteenth century, and was no unworthy prelude to the astonishing victories of Lake and Wellesley, destined within a few short years to decide, once and for all time, the reversion to the empire of the Great Mogul.

THE CAHUSAC MYSTERY.

By K. and Hesketh Prichard, Authors of *Roving Hearts*, *Don Q*, *Tammer's Duel*, &c.

CHAPTER XXI.—DE SARSAN MOVES AGAIN.

STARTING from the basis of his own experience, De Sarsan judged Alice hardly, far more hardly than she at all deserved. Her innocent attempt to forestall Cahusac's judgment of her assumed an altogether different and unpleasant complexion seen through the Belgian's eyes. He did her so much justice as to believe that Cahusac was chiefly to blame; yet he disliked the incident, and prepared to take strong measures to ensure against a recurrence of it.

To speak to Alice herself was, of course, from his standpoint, the very last thing to be done. Wilford's story had somewhat spoilt his ideal of her artlessness. Therefore he deemed it wiser to hold his knowledge in reserve for future use and guidance. He had hoped by continual newspaper attacks to rid himself of the young man's rivalry, but it seemed that only a very partial success had attended his efforts. He hated Cahusac the more; indeed, time and circumstance were forcing his hatred to a height of embitterment that began to influence his usually cool judgment. He resolved to be rid of Cahusac at all costs. It only remained to make the last blow decisive.

First he would order a wide revival of the damaging paragraphs. So far he was safe, for he knew that Cahusac could hardly take action for libel without exposing his stepmother's unfortunate connection with events. And then he would make another move which would be, he believed, far more certain in its results, if more dangerous. Fortune favoured such a step at the moment, for he had recently been able to oblige a personage who was temporarily in a prominent position in politics. A hint to this gentleman, aided by a little clever engineering in the right quarter, and the unpleasant rumours circulating about Sir Malcolm Cahusac might be made the subject of a question in Parliament.

Only under strong pressure of feeling would De Sarsan have been tempted to resort to such a measure, for elements of danger to himself were undoubtedly connected with it. Hitherto he had stood before the world as entirely dissociated from the Cahusac affair, and from motives of prudence he wished to remain so. Puyfot alone had known him as the originator of the slanderous articles, and Puyfot he held in the hollow of his hand. But the Belgian would not allow these fears to deter him, for he hoped that if ever awkward revelations were made he would have strengthened his position—made it practically impregnable—by his marriage into the Lanceley family.

It therefore happened that on an early afternoon a small gentleman arose on one of the cross-benches. He had a question to ask the Secretary for Foreign Affairs. He wished to draw the right honourable gentleman's attention to certain articles that had of late frequently appeared in various newspapers. He then proceeded to read aloud telling extracts, and concluded by inquiring what action His Majesty's Government had taken or intended to take in the matter. The Secretary for Foreign Affairs replied shortly that the subject was under consideration. Some further sentences were exchanged, and the small and honourable member sat down with a busybody's pleased consciousness of having hindered, for a certain time at any rate, the progress of urgent public business.

Two or three of the papers reported the gist of the little member's speech, and added by way

of pendant that it was to be hoped in the public interest that something would be done to clear up quickly and satisfactorily the imputations cast upon so eminent a servant of the nation as the late Sir Malcolm Cahusac. They had no doubt that adequate steps to this end would immediately be taken.

The information reached Cahusac with the morning newspapers. He had been out of town overnight. A couple of hours later he was accorded an interview by one of those gentlemen of whom Britain rarely hears by name, but to whose intelligence and single-mindedness she owes so much; they remain permanently at their posts, and it is upon the pivot of their knowledge and experience that the Ministers who successively represent the department turn and work.

Sir Berrit Fraynes was a thin, ascetic-looking man, somewhat stooped at the shoulders. He stated the case to Cahusac very kindly but plainly. 'It appears to me,' said he, 'that you must take an action for libel against the papers in question. Publicity about one's private affairs is disagreeable, but I am afraid in this case it is unavoidable.'

A slight show of blood tinged Cahusac's face. 'Surely my father's name stands too high to need defence?'

'It needs none here, of course. He was the contemporary and friend of many of us, and I am happy to include myself in the number. But to the man in the street he is no more than a name, and you have to deal with a world always ready to lend an ear to calumny. It appears to me that you have no alternative but to bring an action for libel.'

Sir Berrit looked at Cahusac, who was very pale, for this was precisely the course which he had feared would be thrust upon him; it was the course that all who knew of the matter had been expecting him to take. But, alas! it was the one thing he dared not do. Here lay the single weak point in his armour, the weak point upon which De Sarsan had counted. Cahusac would not risk the chance of any revelation of the disastrous form of blackmail that Lady Cahusac had, in her fear and her weakness, been persuaded to pay.

'I am sorry there are reasons why I cannot bring an action for libel,' said the young man.

Sir Berrit smoothed his moustache thoughtfully. 'Will you trust me with those reasons?' he asked after a pause.

'I hope you will forgive me for saying that, though I am unable to speak of them, they are good reasons.'

'It is exceedingly unfortunate that you cannot take public notice of these slanders,' said Sir Berrit dryly, 'for it is inevitable that people will think it odd you should permit such attacks and remain passive.'

'I do not intend to remain passive. For months past I have been investigating and working in my own way, which I believe will in the end exonerate my father from these malicious accusations. I am sorry not to follow your advice, but I must take my own way in this business.'

'You are possibly right in carrying out the plan that seems best to you. At the same time, the sooner you show you are doing something the better, for half London is waiting to see you bring these fellows to book, and you should not forget that a slander grown stale is a poison for which there is frequently no antidote.'

'I am sure of that, and I was going to ask for special leave of absence that I might have more time to give to this affair.'

'Suppose we say three months' leave—does that meet your ideas? I can arrange that.'

'Thank you.' Cahusac was about to rise.

'Wait a moment.'

Fraynes paused, absently tapping the papers on the desk with a bony forefinger. 'I remember your father very well, and I should like to mention to you some facts which may help you in your future inquiries. I spent a part of last night in looking through certain old documents and records—they make extraordinarily interesting reading, I assure you—and I happened to come upon some entries which appear to me to bear upon this present business. Almost immediately after Sir Malcolm's death secret information of importance began to find its way out of this office. At that time Lord Luxillin was our chief here. Am I right in thinking that he was the brother of Lady Cahusac?'

'Yes;' that was all that Malcolm could say. Was Fraynes bordering upon some chance-discovery of his stepmother's guilt?

But Sir Berrit continued composedly. 'It has never been discovered through whose instrumentality those revelations were made; and yet for a very considerable period information oozed out. Sometimes there might be a break of months; but the trouble would begin again, and so it went on for years. Then the leakage ceased as suddenly as it had begun. This was some few years ago. Matters have fallen back into their ordinary course.'

Malcolm said nothing; he waited for the other to go on.

'Now it appears to me,' resumed Fraynes, 'that this mysterious leakage, commencing as it did just *after* the assassination of your father, may have had some connection with his death. He perhaps stood in the way of the spy, who was obliged to be rid of him before he could with safety enter upon his nefarious work here.'

'My father is supposed to have been stabbed by a foreigner, though on what grounds I do not know,' said Malcolm; 'for, as you are aware, the police never found any trace of the murderer. I wish I could get to the bottom of the mystery! I thank you for having told me this; it confirms

my own opinion that the persons who killed my father must be connected with those who are now trying to destroy his reputation.'

'It seems likely—very likely.'

Malcolm rose. 'I will follow your advice, and spend my time in running these people to earth—if I can.'

He took leave of Sir Berrit, and went out into the roaring streets with a strange sense of remoteness from the life about him, the life to which he had been accustomed through the years of his manhood. In spite of Fraynes' kindly treatment of him, he knew that his refusal to institute a libel action must seem both odd and unaccountable in the eyes of his chief.

(To be continued.)

MAN-EATING SHARKS.

By Day Allen Willey.

THE sailor says that the most ferocious creature that swims in the sea is the shark. By that he does not mean every shark, but what is called the 'man-eater,' just as a certain species of tiger in India is called the 'man-eater' because it hunts human beings for its prey, preferring them to animals.

The man-eating shark is not the largest of this species of fish, but is noted for its strength, also the rapidity with which it swims. It goes through the water so rapidly that few fish exceed it in swiftness, and it is thus able to catch food of that kind. This is especially true in the waters—such as the Indian and South Atlantic Oceans, the Pacific Ocean, and the waters tributary to them—that are deep enough for the shark to swim in.

Strange to say, this fact has obstructed such works as the formation of harbours, the building of piers, and other operations where it is necessary for men who are divers to go beneath the surface. Many are the adventures which they have had, and not a few have been the victims of the sharks in spite of the fact that the divers are armed with knives and other weapons to protect themselves while under water. The American Government is building a harbour on the island of Hawaii for warships. It is necessary to remove a large quantity of coral rock, and this can only be done by blowing up the formation with powerful explosives such as dynamite and giant powder. The charge of explosive must be laid upon the rock formation sometimes twenty or twenty-five feet below the surface of the water, and is connected by copper wires with an electric battery. The spark from the battery sent through the wires, igniting the dynamite or giant powder, causes it to explode. To set these charges in place requires sometimes several hours, since the diver has to make holes in the rock to receive them, and then connect the electric wires. After the work is done he gives the signal to be pulled up by the rope which reaches to the boat on the surface, and after he has been hauled up and is out of danger the blasting is performed.

Since the work on the harbour at Hawaii was begun sharks have caused much trouble, as divers have to be employed, and at times operations are stopped for several weeks because the sharks are so numerous that they cannot be killed or driven away. In order to get men who are brave enough to go down into the sea it is necessary for the company to pay very large salaries, as the divers literally take their lives in their hands. One of these divers is a Swede named Martin Lund, who does not know what fear is. He works in connection with a native crew of the Sandwich Islands, and is noted as an expert swimmer and diver. Physically he is a giant, and in his diving-suit must weigh nearly six hundred pounds. Lund works eight hours a day, and sets off about eighteen blasts in that time. Sometimes he carries on his work with sharks all about him. He often has to fight them. The blasts kill large numbers of small fish, and every day as soon as the blasting begins the sharks come around looking for food. Sometimes as many as twenty of them will be seen at a time.

The whole outer section of the harbour has been laid out like a checker-board. Lund, or Olepan the Hawaiian, lays the explosive on a ledge and fixes the electric connections. When there are only two or three feet of water above, it is blown up from four hundred to five hundred feet in the air; but at thirty feet there is hardly a lift of the surface of the water.

When Lund had his first battle with the sharks he was armed only with a knife. He had told some of the diving crew that there were lots of sharks about, but they thought he was merely trying to make it appear that he had a particularly dangerous task. One day they felt a jerk at the line, and hauled quickly, and there was Lund slashing away at something near his feet. When they had hauled him in a dead shark also floated to the surface. After that Lund decided to arm himself with something more deadly, and had a spear made of steel. This was about eight feet long, and as sharks usually attack from below he could drive the sharp head of the spear into them, and thus ward them off. On one occasion, however, he was attacked from above by a man-eater. While laying a charge of powder and wiring it up for a blast something made a turn above him, and, looking up, he saw a big white belly overhead. He picked up his spear and attacked it, and it rose to the surface. The

crew in the boat were startled to see the shark appear near them, but they threw a looped line over its tail and hauled it aboard dead. Lund had aimed at the right spot.

The Kanakas of the Sandwich Islands have also been attacked by the man-eaters, and so many were killed while bathing or swimming that they have a fierce hatred of the sharks, and kill them when possible by using various kinds of devices. Pearl Harbour, where Lund is at work, in the old days was a fishing-ground; but the sharks were a great enemy to the edible fish, so the Hawaiians built on a reef at the entrance a shark-pen. In the one entrance to this there were four feet of water at high tide, but at low tide it was impossible for a shark to get out or in. The natives would take goats and old horses, lead them into the pen from the shore-side, kill them, and anchor them. After a day or two the sharks would be attracted by the odour of the carcasses, and they would follow the wall until they came to the opening. By the time they had had a good meal the tide would have fallen, and the natives would then go in and kill them.

The man-eaters are not worth much except for the skins, which can be made into shagreen; but it is a satisfaction to the Hawaiians to kill them merely out of revenge.

The waters about the Sandwich Islands probably contain the largest specimens. A few years ago a Japanese fisherman looking for other fish off the harbour of Honolulu caught one. His line was a tough rope, with two or three feet of steel-wire rope attached to a huge hook which was baited with a piece of meat. His comrades came to his aid, as the weight was so great that the catch could not be hauled in by one man. When it was brought to the surface it was found to be a monstrous man-eater measuring nearly twenty feet in length. On the stomach being opened a portion of the body of a man was found. The next day a native woman, by means of certain scars, identified the body as that of her husband. He had mysteriously disappeared a day or two before while bathing inside the reef off Diamond Head. Some ducks, tin cans, and two blocks of wood were also found in the stomach of the fish. Another man-eater caught a few days later was fourteen feet long and four and a half feet in circumference at the widest part. The mouth measured twenty-two inches from top to bottom, and twenty-eight inches across, and the jaw, weighing about one hundred and fifty pounds, when dried could be slipped over the head of a man.

Sailors in the American navy have many adventures with man-eaters, and when a warship is in water frequented by sharks the men are usually prevented from bathing or exposing themselves unless accompanied by a boat's crew, with guns, to watch for the sharks and protect the swimmers. While one of these vessels was lying in a harbour of the Philippines a few years ago one of the mates, while bathing from the side of the ship, was bitten on the foot by a shark. The foot was very badly torn and crushed; but the man recovered, only a slight stiffness of the foot remaining. An official report on file in the Navy Department states that as one of the boats belonging to the little gunboat *Elcano* was being rowed out to the ship the plug in the bottom of the boat came out. To prevent it from being swamped, a sailor, J. J. Dunlap, belonging to the *Elcano*, thrust his finger into the hole. The finger was immediately bitten off as if it were amputated by a surgeon, though the amputation was by a shark's teeth.

On the American coast the man-eaters are not numerous, but sometimes they will come near to summer resorts where the water is deep enough to permit them to swim. They are seen along the coasts of Florida and New Jersey; and the life-guards at the summer resorts, who go out in boats to look after the bathers, always keep a close watch for the shark-fins which show their presence by sticking out of the water.

Sometimes the sharks will go up the rivers which enter the Gulf of Mexico and the South Atlantic Ocean. A professional swimmer named Clark, who was giving an exhibition in the harbour of Pensacola, Florida, had a thrilling experience. He had agreed to be sewn up in a big sack, heavily weighted with sand, and be thrown into the bay near the navy-yard. From the bag he was to escape by cutting his way out with a knife and swimming ashore. At the appointed time a flat boat took him out some distance from shore, and after being tied in the sack he was thrown overboard. He had hardly gone more than thirty feet below the surface when something bumped against the sack, and almost instantly the idea flashed through his mind that it was a shark. Before he could do anything there was a bump from the other side of the bag. In a moment or two he had cut his way out and was rising to the surface, still clutching his knife in his hand. On reaching the surface he was greeted with cheers. He started to swim toward the nearest boat, when the water parted a few feet to one side, and he could make out the long black fin of a shark. The monster headed at once for him, and as he was about to dive to escape its clutch another shark dashed in. As the first shark turned over on its back in order to bite, Clark dived below the surface, then up under the shark and drove the knife time after time into its vitals, and it sank to the bottom. As he came to the surface, gasping for breath, a yawl-boat, manned by excited sailors from the navy-yard, ran alongside, and he was pulled aboard just in time to escape the second shark. Clark saved his life by powerful swimming and diving, as it was necessary for the man-eating shark to turn over to grasp its prey.

In many parts of the West Indies, lighters or

small barges are used to take cargo off vessels and carry it ashore. An English seaman named Thomas was working on one of these lighters in the harbour of Aux Cayes, when he slipped on a coil of rope and fell overboard. The sharks at once made a rush for him, and it would have been all over with the sailor had not the first-mate rushed to the near-by galley, grabbed a large piece of beef, and, turning to the side, hurled it into the water. This fell in the midst of the sharks; and while they were fighting over it Thomas swam to the side of the lighter, grasped a line, and was hauled on board.

The danger of the shark at bathing resorts is shown by the experience of a man named Wright, who went to the greatest summer resort in America, Atlantic City, to spend his holiday in fishing and bathing. With a number of friends, Wright went out to the fishing-banks in a naphtha-launch for a day's fishing. After they had made a good catch, the captain was about to weigh anchor and start for home, when Wright insisted upon having a swim. Being an expert, the young man dived boldly off the craft and swam away like a fish. Shortly afterwards the captain signalled for Wright to return. The swimmer, by long, powerful strokes, immediately turned, when those in the launch were horrified to see, less than a hundred yards away, and directly in the path of the swimmer, a school of man-eating sharks. The captain at once started his engine and headed the boat for the scene of action. Meanwhile he had seized a loaded shot-gun which he always carried on board. By this time Wright had awakened to his danger, for he was seen swiftly swimming back to the boat. In less time than it takes to tell, the captain had fired and killed the foremost shark. When the launch reached Wright, who was almost exhausted, he was lifted aboard and immediately swooned. Three of the toes of his right foot had been nipped off by a shark.

The hatred of the man-eater is such in Central America that the people of Panamá have a way of catching and killing sharks which would seem indeed cruel if it were not for the ferocity of the fish. The shark will bite savagely at anything that is flesh, and advantage is taken of this fact to place hunks of meat on large hooks which are attached to ropes thrown out from vessels. Several men are usually required to haul in an ordinary shark, owing to its strength; then it is killed by what is called 'crucifying.' The shark is hooked and drawn on deck, care being taken that it cannot make use of its terrible teeth. It is laid down on boards and the fins securely nailed there in such a way that it cannot use them. The tail is then cut close off, and the fish thrown overboard. It cannot swim, and it cannot steer itself. It is helpless, and the other members of its family attack and devour it.

THE ARISTOCRAT.

By Muriel Currey.

THE sun of a May evening was setting behind Paris as Désiré de Vacon, with a couple of servants at his heels, trotted along the white road which led to the gates of the city. There was a strange glow in the sky. Désiré reined in his horse and drew his hand suddenly across his eyes; it had seemed to him for a moment as though he saw the town through a mist of blood. He laughed at the fancy, and cantered on eagerly. Five minutes later he had passed through the gate, and was gazing curiously about him as one of the servants guided him through the narrow streets to the *hôtel* of his father.

He clattered under the great archway and into the courtyard, where some lackeys were lounging. As they watched him dismount with a contemptuous stare, which did not change when he asked for the Vicomte de Vacon, he felt strangely countrified. One of the men answered lazily that the Vicomte could not be disturbed at the moment; but if monsieur would leave a message—— 'Tell him,' said Désiré, 'that Monsieur de Vacon, his son, awaits his pleasure.' The manner of the lackey changed instantly. 'If monsieur will come this way I will inform M. le Vicomte at once.'

He followed the man across the hall and up the wide staircase, his heavy boots and spurs ringing on the polished boards, which reflected the wax candles in little pools of light. The servant left him in the vast *salon* on the first floor, and he walked about, touching a thing here and there with curious flashes of memory. He thought of the last time he had been in that room, when the walls had been hung with black, and he had been brought in, a small and terrified child, clinging to the hand of his nurse, to gaze for the last time on the waxen face of the mother who had never been more to him than a radiant vision. It was on that day he had started on the long and dream-like journey to the ancient château on the Loire, which he had never since left for more than a couple of days. He thought of the great, bare rooms, and the wide river flowing by the walls, and felt suddenly stifled by the magnificence around him. He impulsively crossed to a window, but checked with his hand on the catch as he heard the door open behind him, and the major-domo announce in sonorous tones, 'M. le Vicomte de Vacon.'

There was a moment's silence as Désiré advanced to kiss his father's hand. The Vicomte

surveyed him curiously, and noticed the boy's handsome face and delicate hands with a thrill of satisfaction. 'Properly dressed,' he thought, 'he will do me credit at Versailles.—So,' he said, 'despite your protests last summer that you intended never to leave the country, sylvan delights have begun to pall.'

Désiré blushed, and the Vicomte laughed lightly; he wondered how long his son would retain that accomplishment.

'Sir,' said the boy shyly, 'I thought it my duty to come to Paris.'

'Faith, I wish all duties were as pleasant!' The Vicomte moved over to the chimneypiece, and the firelight played on his brocaded coat, on his diamond shoe-buckles, and on the great ruby ring on his finger. There was a fête at the Court to-night, and it was not for nothing that the Vicomte de Vacon was accounted the best dressed of all the nobles who danced and gambled and made love beneath the wax candles at Versailles. 'Well,' he continued carelessly, 'and what is the duty which leads to such a paradise in this world as well as in the next?'

Désiré hesitated. He knew his father but slightly, and it seemed impossible to explain his hopes and ambitions to this very exquisite stranger, who regarded him through his quizzing-glass with such complete detachment.

The Vicomte dropped his glass and spoke lazily. 'As a rule when a man begins to talk about his duty it is money or a woman. Do you want me to pay your debts or get you out of a scrape with the steward's daughter? I'll forgive you anything, so long as you have not mortgaged the château or married the girl.'

Désiré hardly heard his father's words; instead, there rang in his ears that cry of the suffering peasants of France which had called to him so clearly in the quiet of the woods on the banks of the Loire. He spoke abruptly: 'I have come to Paris as a delegate to the Estates-General.'

The Vicomte had been playing with a little Sèvres vase on the chimneypiece, and one of its delicate handles snapped suddenly and it fell with a faint tinkle on the stone hearth. Désiré remembered that sound long afterwards. 'You have come to Paris as a traitor to your king!'

'No, father!'

'Every man who sits in that assembly is a traitor.' The Vicomte's voice cut like a whip.

'Indeed, we would but reform abuses, and help His Majesty to govern.'

'Do you not know that he is the viceroy appointed by Heaven, and would you dare to interfere?'

'Ah, but the king cannot know the sufferings of his people; they are dumb, so that we would speak for them.'

'And you would associate with these'—— The door at the end of the room opened, and a girl came in laughing. The Vicomte stopped abruptly.

'Are you ready, uncle? The coach is at the'—— And she, in her turn, stopped as she caught sight of Désiré.

'Come here, Marie; let me present to you your cousin Désiré.—Désiré, this is my ward, and your cousin Marie.'

The girl dropped him a demure little curtsy as Désiré kissed her hand; he remembered her dimly before he left Paris, when he had despised her as a baby from the lofty superiority of six; but now he felt young and countrified as her merry eyes gazed at him critically, and the Vicomte watched them both. He vainly sought for something to say.

But she came to his rescue. 'Why, cousin, I thought you despised Paris and all our gaieties, and passed all your time wandering in the woods writing poems to nature!'

'I hardly think Désiré will add to the gaiety of Paris.' His father's voice stung him, and once again Désiré blushed. Marie looked at him curiously. 'Come,' continued the Vicomte, 'if the coach is ready, let us go; you must not keep her Majesty waiting.'—He turned to his son. 'I have given orders that a room should be prepared for you.'

'Good-night, cousin,' said Marie, dropping him another curtsy.

Désiré heard the click of her little heels on the stairs, and then the rumble of the coach as it drove out of the courtyard.

It was dull enough in the great dining-room, where he supped in a little oasis of light, while the lackeys flitted in and out of the shadows like figures in a dream.

He was glad when the servants left the room, and pushed back his chair impatiently. He was oppressed by the silence and the luxury. He wandered upstairs presently, and had a faint sensation of home-coming as he entered his room; it had been his nursery long ago. His servant was unpacking his valise, and Désiré threw himself into a chair in front of the fire. 'Well,' he said as the boy came to pull off his boots, 'how do you like this gay Paris of ours, Jean?'

'Oh monsieur, I wish we were at home again!'

'Why, what would Anne say? Was she not overjoyed to greet her brother?'

'Monsieur, she is gone.'

'Gone! What do you mean?'

Jean stammered, 'A friend of M. le Vicomte comes here, and sometimes he would talk to Anne. One day his servant came, and she went away with him. She has never come back.'

Désiré sprang up. '*Mon Dieu*, he shall pay for this! What was his name?'

'M. le Comte de Kervelle.'

'To-morrow I will speak to M. le Vicomte. Never fear, Jean; she shall be found.'

It was what the country-bred Désiré called late, and Paris folk called early, when he demanded to see the Vicomte the next morning. His father's valet met him with an imperturbable face. 'It is forbidden to enter the room of M. le Vicomte until he rings.'

'And when will that be?'

'Ah, who can say, monsieur? Perhaps ten, perhaps eleven, perhaps twelve.'

It was nearer one when Désiré found his father sipping his morning chocolate, whilst the sunlight struggled in through the heavy brocade curtains. Désiré spoke stammeringly of the girl.

The Vicomte laughed in his curious, toneless way. 'So you are prepared to champion the cause of a pretty woman as well as that of the people! Faith, if you wanted the girl yourself why did you let her come to Paris?'

The boy sprang up indignantly. 'The girl was nothing to me; but do you not understand, sir? She was lured from this house by M. de Kervelle. She is lost, and'——

'Are you quite sure that she went'—the Vicomte searched for a word, and found it with a slight smile—'unwillingly?'

'Sir, she was a good girl, and he is a villain!'

'I understand. The *canaille* have all the virtues, and we all the vices.' The Vicomte stirred his chocolate wearily. 'Let us close the discussion. I have not your enthusiasm for the people, and it fatigues me.'

Désiré's hands clenched. 'He shall answer for this to me!'

The Vicomte's lips tightened over his teeth. 'It is not usual for gentlemen to fight duels over servant-wenches.' Désiré shrank from the bitterness of the sneer in his father's voice. 'Besides which, there is another reason—M. de Kervelle is likely to become your cousin.'

'My cousin!' cried Désiré incredulously.

'Yes; he wishes to wed Marie.'

'*Mon Dieu!*' It was hardly more than a gasp.

The Vicomte lay back in his chair and watched his son. 'Yes,' the languid voice continued, 'he was the king's ward, and His Majesty has interested himself in the affair—in fact, has begged the hand of Marie in order to bestow it on M. de Kervelle.'

Désiré sprang to his feet. 'And you answered?'

'I told His Majesty that there was but one man whom I would prefer to be the husband of Marie.'

'And he is?'

'Yourself.'

'But, sir, she does not even know me.'

'Perhaps that is in itself an advantage.' The Vicomte laughed as the boy winced, and then his expression changed. 'Come,' he said sternly, 'let us understand each other. Give up this fantastic nonsense of the rights of the people, resign your seat in the Estates-General, and take your proper place as my son. There is waiting for you all that makes life pleasant: a commission in the King's Bodyguard, the amusements, the gaieties, the excitements of Paris. I shall not stint you for money, and when you weary of it all you will find awaiting you a rich, and I may say charming, wife.'

There was a pause, and then Désiré spoke slowly: 'And if I refuse?'

'You will have the rights of the people, though I believe they do not yet include the right of entrée to His Majesty's levee.'

'But Marie?'

'Marie will wed M. de Kervelle.'

'After what I have told you about him?'

'The remedy is in your hands; but I have no doubt he will make her a most excellent husband.'

Désiré turned away and began to pace up and down the room. His father watched him curiously. 'May I ask what you intend to do?'

The boy stopped in his nervous walk and faced his father. 'I cannot—I cannot give up my seat; I must do my duty.' It was a cry, almost an appeal.

The Vicomte showed no answering emotion, but he too stood up. 'Ah, the *canaille* must possess a strange charm which I have so far failed to discover. In my present blindness I prefer the society of gentlemen.'

'Monsieur!' cried Désiré.

But, with a slight gesture of apology, his father went on: 'You are, of course, free to stay here. You will not be much troubled by the society of Marie and myself, which I imagine you would hardly find congenial. And now I must beg you to excuse me; I have still my toilet to make.'

Désiré made an impulsive movement; for a second he longed to ask his father's forgiveness; but the Vicomte's smile never wavered, and Désiré turned and walked quickly out of the room. He was suddenly afraid that he would disgrace himself by bursting into tears.

As the door closed behind the youth the smile faded slowly, as though some spirit in passing had gently brushed it from the Vicomte's face, and the real man looked with haggard eyes upon the ruins of his 'castle in Spain,' the fairest of all his great possessions, though none of his friends had ever dreamed of its existence.

It is hard to renounce all the pleasures of Paris at twenty-one, perhaps the more so if one has never tasted them; and when the Estates-General was not sitting Désiré wandered aimlessly about the narrow, evil-smelling streets, thinking with a passionate longing of the fair country and great woods on the banks of the Loire. He saw his father and Marie but seldom; sometimes he would hear her merry laugh, and shrink back into some dark corner as she ran down the wide stairs after his father; then he would peep almost stealthily out of some window to watch them drive away in the great gilt coach.

Once Marie had found him standing idly in the big *salon*, and had set herself to amuse him.

He was shy enough at first, but she had asked him of the country, of his life in the great lonely château, and soon he was talking eagerly. The rays of the setting sun poured in through the high windows and filled the room with a golden dusk. Somewhere a woman was singing a love-song.

Désiré stopped abruptly in the middle of a sentence. 'Marie,' he said suddenly, 'do you like M. de Kervelle?' The impersonal note had gone from his voice; the girl looked up quickly, and for a second their eyes met. '*L'amour, l'amour!*'—the woman's voice died away.

Marie laughed lightly. 'M. de Kervelle! Why do you ask? Do you not know that he is the handsomest, gayest, wittiest courtier at Versailles, and they say the finest swordsman in France?'

Désiré leant forward, trying to read her face, and said again with a curious insistence, 'Do you like M. de Kervelle?'

Marie hesitated, and then blushed. 'I'——

'I am sorry to interrupt so interesting a *tête-à-tête*'—Désiré sprang to his feet; in the shadow stood his father, leaning idly against the door—'but I fear that it grows late, and Marie is in attendance on Her Majesty to-night.'

Désiré wondered how long the Vicomte had lounged there with his usual delicate smile.

'Perhaps,' went on the suave voice, 'Marie has been more successful than I was in my persuasions, and that Désire may yet serve His Majesty. Come, Marie, will you not use your power?'

The girl smiled and held out her hand. 'Cousin, will you not come with me?'

Désiré felt a sudden rage in his heart. Had she been fooling him? Was it a plot to win his allegiance? 'I cannot—I cannot!' he said sullenly.

The light faded out of Marie's face. M. le Vicomte shrugged his shoulders. The last ray of sunlight lay like a golden bar between Désiré and the others.

After this Désiré became lonelier than ever. The Estates-General declared itself to be the National Assembly; many of the moderate men left it, and the extremists distrusted Désiré as much for his name as for his known loyalty to the king. He thought much of Marie, and proved to himself several times a day that he was not in love with her, and that she had no power over him; but he avoided her with a curious persistence. When he had first come to Paris he had spent much time and trouble in trying to find Jean's sister Anne, but all the clues which had seemed so hopeful in the beginning had ended in disappointment, and at last he had abandoned the search in despair.

So the long summer days dragged on, and all Paris lay breathless, gasping in the heat, waiting for—what? No one knew; but the sullen groups stood at the street corners, and an angry murmur would rise as the nobles swung past in their coaches.

One evening, as Désiré wandered along the quays seeking a little coolness, he heard the faint, distant rumble of thunder. The darkness came quickly, every now and then illuminated by a flash of lightning as the storm drew nearer and nearer; the city seemed to quiver in sympathy with the electricity in the air, and what yesterday had been but a solitary murmur here and there had now grown to a roar. In the distance some one was beating a drum, and the sound seemed to Désiré like the throb of an angry heart.

The street where his father's house stood was full of people, and in one place the throng was particularly dense as they crowded round something on the ground. Désiré started to push his way quietly through, and had almost reached the great gates when he was suddenly stopped by a huge man with a hammer in his hand.

'Here!' said the man roughly, 'who are you, and where are you going in such hurry that you needs must thrust honest folk out of your way?'

There was a hush in the crowd as it waited for Désiré's answer, and his voice rang out very clear in the stillness, 'I am Désiré de Vacon.'

There was an angry roar, and the hammer swung up above his head, when some one in the crowd shouted, 'Let him alone, you fool; do you not know that he is a member of the National Assembly, and a friend of the people?'

The roar changed into a cheer, and the hammer swung harmlessly by the man's side; a lane opened, and as Désiré passed into the courtyard there floated in after him the cry, 'The friend of the people!' It rang loud in the quiet hall, where a small group was standing as Désiré entered shyly.

For a moment no one spoke, and then Désiré gave a cry, 'Marie, you are hurt!' There was a cut on the girl's cheek, which was bleeding a little. She smiled and opened her lips to speak; but M. le Vicomte was before her.

'The work of your friends,' he said. 'The coach had difficulty in forcing its way through; but luckily M. de Kervelle was riding at its window, and I fear that you will have to wear mourning for one of the *canaille*, who will in the future hurl neither insults nor stones at his betters.'

Désiré thought of the little group that he had seen, and understood.

'But,' continued his father, 'I do not think that you know M. de Kervelle.—M. de Kervelle, allow me to present to you my son Désiré—the friend of the people.'

Désiré shrank back at the bitterness of his father's tone; but M. de Kervelle stepped out of the shadow where he had stood hitherto, and bowed silently. He appeared to be about thirty, tall, handsome, and beautifully dressed, and the boy looked at him with a passionate envy.

The Vicomte spoke again. 'Well, monsieur, will you not congratulate Désiré on his choice of friends?'

Monsieur de Kervelle shook out the lace ruffles at his wrists and laughed pleasantly. 'Ah, M. de Vacon, if we had all to answer for the indiscretions of our friends I fear few of us would know an easy moment.' He turned to Marie. 'Mademoiselle, I trust that you will feel no ill effects from your adventure, which has proved what I always believed, that you are as brave as you are beautiful.'

'Ah, monsieur,' said the girl with a smile as he bent to kiss her hand, 'you are too kind. Indeed, I would express my gratitude to you.'

'Yes,' broke in the Vicomte, 'it is well, Marie, that you have at all events one cavalier who is ready at your side when you need him.—M. de Kervelle, I would add my gratitude to that of my niece.'

'I assure you,' M. de Kervelle answered with sudden earnestness, 'that I desire nothing more than to be of service to mademoiselle.' He turned and bowed to Désiré, who with an impulsive movement followed him out into the courtyard, where a lackey held his horse.

'Monsieur,' the boy stammered, 'will you tell me of Anne?'

'Anne!' M. de Kervelle repeated in a puzzled voice.

'She was a servant here, and — and'—— Désiré stopped, blushing crimson. 'She is a sister of my valet,' he went on desperately, 'and she has disappeared.'

'And am I the culprit?' M. de Kervelle laughed, and laid his hand on Désiré's arm. 'My dear boy, the girl had a lover in my company of the Guard, whom she was for ever pestering me to make a sergeant; he was a worthless fellow, but your cousin interceded for him too, so I took him into my own service. One day he disappeared, and with him a pair of diamond buckles.' He dropped his bantering tone, and his grip on Désiré's arm tightened. 'Monsieur,' he went on seriously, 'the girl was nothing to me. Do you not think that a man who has gazed into the eyes of mademoiselle is blind to all other women?' He held out his hand. 'You believe me?'

Their eyes met for a moment. 'Yes!' cried Désiré.

'Thank you,' said M. de Kervelle simply, as he stood with the boy's hand in his; and then with his sudden charming smile, 'I would not have you think so meanly of me.'

The kindness of the voice brought tears to Désiré's eyes; it was so unexpected, and he had met with so little kindness in Paris. 'Monsieur,' he cried almost with a sob, 'will you ever forgive me? Indeed I crave your pardon.'

'Bah! it was a natural enough mistake,' M. de Kervelle answered lightly as he swung himself into his saddle. He looked down with sudden pity on the boy's forlorn figure. 'Will you not come and see me? I am always to be heard of in the guard-room at Versailles. Adieu, or I hope only *au revoir*.'

In another moment he was gone, to be greeted by an angry murmur from the crowd in the street; and Désiré turned slowly and re-entered the great hall. For months he had hated M. de Kervelle, and now he passionately desired his friendship.

At the foot of the great stair the Vicomte awaited his son, the jewels in his rings flashing when they caught the rays of the setting sun. He spoke with the usual quiet, and Désiré listened in a dream, fascinated like a child by the sparkle of the diamonds.

'Doubtless, after to-day, it can hardly be pleasant for you to live in the house with people who are on such bad terms with your friends. Indeed, you might have the misfortune to be mistaken for one of us. If you will acquaint me with the address of your lodgings I will send you money, and you will doubtless live very happily on my bounty, as do many of your associates.'

He turned and passed slowly up the stairs, but the knuckles of the hand that gripped the balusters showed white as the door closed behind his son.

Désiré found himself something of a hero during those hot July days, as his story passed from mouth to mouth in the buzz of talk at the cabarets; but he soon grew as shabby as his admirers, and he was glad enough to earn a franc here and there doing copying for lawyers. To his father he sent no word.

The 14th of July came, and with it the attack on the Bastille. Désiré saw for the first time a Paris mob in its naked savageness, and he wandered away sick with horror, letting his feet take him where they would, till he realised with a start that he was in the street next to that in which his father's house stood. A strange, angry roar such as he had heard before the attack on the Bastille suddenly beat on his ear, and he began to run. When he turned the corner, however, the street was empty except for one woman in a black cloak, who shrank back in the shadow as he approached. He turned to ask her a question, and gave a low cry. It was Marie!

For a moment she did not recognise him in his ragged clothes, but then she clung to his arm. 'Désiré, the mob have broken into the *hôtel*, and all the servants have run away!'

Désiré's hand flew to his side; he forgot that the people do not wear swords.

'Your father ordered me to go too,' Marie's breathless voice went on, 'or indeed I would not have left him; but he said'——

She stopped abruptly. A man on a horse was galloping down the street, and the light from one of the flickering oil-lamps fell on his face as he passed them.

'M. de Kervelle!' cried Désiré.

The soldier reined in his horse. 'De Vacon! Mademoiselle!' he said in astonishment. 'I heard that the mob had risen, and came to give you warning.'

'Monsieur,' said Désiré hurriedly, 'they are attacking the Hôtel de Vacon. I confide mademoiselle to your charge. I must go to my father.'

M. de Kervelle bowed. 'I am proud, monsieur, of your trust. I will guard mademoiselle safely to Versailles.'

'No,' cried Désiré with sudden, passionate foresight; 'take her far beyond Versailles. This night is but the beginning; there is no safety for us in France.'

There was a second's pause before he swung Marie up on to the great black horse behind M. de Kervelle, and as he turned to run down the street, with the touch of her lips on his cheek, he realised with blinding vividness that he had given the woman he loved to another man.

The great gates were broken, and the courtyard deserted; but through the open door of the house he could hear the murmur of a crowd, and in a moment he was in the hall. At the head of the stairs, in the soft light of the candles, stood his father; and the mob, the first frenzy over, had stopped for a moment, abashed by their hereditary fear of the aristocrat.

The Vicomte raised his quizzing-glass and surveyed them. 'May I ask'—— he began in his quiet voice; but an angry roar interrupted him.

Désiré rushed forward with a suddenness that opened a way for him through the crowd until he stood on the step below his father. 'My friends,' he began—he was greeted with hoarse cries of welcome from some of the men who knew him—'let us not stain our cause by acts of violence, but let the rights of the people be won by truth and mercy.'

A woman's laugh rang out, and the crowd jeered; their patience was at an end; they began to surge up the wide staircase.

Désiré raised his hand. 'You know,' he cried, 'I am a member of the National Assembly. I am a friend of the people.' He sprang up on to the landing by his father's side. 'I am his son!'

There was a moment's silence. Some one in the crowd moved uneasily, and a small china vase fell from a bracket and broke with a little tinkling sound. Désiré's mind swept back in an agony of memory to the day of his first arrival in Paris, when he had announced his allegiance to the cause of the people, and just such another vase had fallen from the Vicomte's hand and broken on the wide stone hearth.

Suddenly he realised that his father was speaking. 'He lies, as you *canaille* always lie,' said the contemptuous voice; 'he hopes that you will go away, and that I, out of gratitude, will then allow him to rob at his leisure.' He paused, dusting some snuff from the tips of his fingers; then, facing the people again, he said, 'I have no son.'

'Death to the aristocrat!' screamed the woman who had laughed before.

Désiré's eyes met hers, and he laughed curiously; it was Anne, his valet's sister, whom he had tried so hard to find. The man beside her raised a pistol and fired; the crowd hesitated, and a great red stain soiled the Vicomte's brocaded waistcoat. He gazed at it for a second, and then fell forward on his face. 'St Denis!' he muttered. It was the old cry of the chivalry of France, and the boy's clear voice took it up.

'St Denis!' cried Désiré, as he snatched his father's sword, and then the rabble stormed up the staircase.

'It is easy to see,' said a butcher afterwards, as he wiped his chopper on the embroidered seat of a chair, 'that the boy was an aristocrat after all. Look at the way he used his sword.'

THE LADY-MOON.

THE lady-moon, so high, so bright,
So softly shining through the trees,
Can fill my mind with deep delight,
And inward peace, and noble ease.
Long has the day been, hot and close,
With scarce a breath the leaves to stir;
But now my lady gives repose,
And gentle winds breathe through the fir.

Why do I say 'my lady-moon'?
Because a woman's word is kind,
Her touch is light, her chiefest boon
The rippling smile which well can bind
Our hearts to her. And this soft light,
So tremulous, is like her wit,
Her gentle armour 'gainst affright,
Her power to make us well and fit!

I lean upon a barrèd gate,
And watch the shadow and the shine;
Dim moths around the wych-elm wait,
And in the distance lights outshine.
The peace which nought of commerce stirs,
The calm which none may take away,
Steals over me across the firs,
And I can breathe upon the way.

What if the struggle should be hard?
What if, in whilom doubts of day,
I almost bend? The kind reward
Of Luna's lamp can heal the fray.
Long thoughts of music stir the deeps
Of inward being, and I see
A life immortal dwells within—
It broods around each path and tree.

Dear silver moon, my lady-love—
Adored of old, and ever near—
Comes back to me while thus I move
Along this silver path so clear.
Old songs awake, dear hands I take,
Dear voices chime from that far past;
And you are still the friend to wake
The scene to come, so bright, so vast!

THE REAL CANADA.

A FEW PRACTICAL HINTS ON ITS CLIMATIC, ECONOMIC, AND SOCIAL CONDITIONS.

By NORMAN MURRAY, Montreal,
A Scottish-Canadian Settler of Thirty Years' Standing.

MY last article * on this interesting topic was chiefly political and sentimental, in criticism of, and in answer to, a former article in *Chambers's Journal*. In the present article I propose to deal with a subject of prime importance, particularly to any one in the Old Land who is thinking of 'trying his luck' in Canada.

Canada is about the best country in the world for some people to come to at the present time, and the very worst for some other people. It is a vast country, with a still very small population. There is really no other country in the whole world fit for human habitation that has so few people to the square mile as Canada. It extends three thousand miles from the Atlantic to the Pacific Ocean, and from latitude forty-five degrees to the North Pole. It is surrounded by the ocean on three sides, and by our very interesting Uncle Sam's dominion on the south. Yet in all that vast territory there are no more people than the population of 'Greater' London and Glasgow put together; it would be a much better country to live in if there were at least ten times the number of people, provided they were the right sort. One thing certain is that it is a country much more suitable to people from the northern countries of Europe than from the southern.

Much mischief has been done to the interests of Canada and the Empire by suppressing the truth about the climatic conditions of the Dominion, which fact is largely responsible for many people coming to Canada who should never have left their native land, particularly from the south of Europe and parts of Asia and Africa. Canada is both a very cold and a very hot country, and one would have to live in it for a whole year before he would be able to speak impartially about the climatic conditions. To any one who lived in Canada only during the six winter months, and then went away, the ideal summer weather it enjoys would be incredible. On the other hand, to any one who lived here only during the six months of its ideal summer weather, which is not excelled anywhere in the whole world, the hard frosty weather of nearly six months would be equally incredible. But such are the facts. The climate changes from extreme cold to extreme heat, and that often very suddenly. It varies from thirty degrees below to ninety above zero. There are also great varieties of climatic conditions in different parts of Canada. There are some districts, particularly toward the west and south-west, that have very little hard winter weather; but this region of Canada—unfortunately, some of us think—forms a comparatively small portion. If we could only get the climate made to order, and have at least the glorious St Lawrence open for navigation for a longer portion of the year, what an ideal country Canada would be! We have, however, to take it as it is, and make the best of it. After all, in this vast territory, Canadians, in common with the rest of the people of the Empire, have a great heritage that deserves great care—more, I think, than some people seem to take into serious consideration. The larger portion of the country is covered with snow, and all the waters are frozen on the surface, for nearly six months of the year. The question of climate, in discussing it with outside people, is almost as delicate with some native Canadians as the proverbial question of age is to young ladies near the close of the marriageable age. Yet I never could see any sense or reason about this horror of mentioning the snows and colds of Canada. Canadians never forgave Rudyard Kipling for calling the country 'The Lady of the Snows.' Probably the title was one-sided, and a little misleading to the stranger. A more appropriate title perhaps would have been 'The Lady of the Flowers and Snows,' for that is exactly what Canada is. There is nothing really terrible, however, about the climate of Canada to people from the northern countries of Europe. Europeans from northern latitudes do not feel the cold when they come nearly as much as the native-born Canadians, which is probably the reason why so many Canadians have so much horror of mentioning the snows of Canada to strangers. They are judging other people by

* *Chambers's Journal* (1911), page 111.

 [*All Rights Reserved.*]

their own feelings. They do not seem to realise that they are not the only people in the world who know what ice and snow mean.

Canada is a splendid country for young men, and particularly for young women, able and willing to work. People much over forty years of age without a good bank-account or influential friends should, however, think twice before throwing up any fairly good job in the Old Land to come here. Life in Canada, and in fact in all North America, is very strenuous. Every one wants to accumulate as much money as he can, as quickly as possible, and many unfortunately are not over-particular about the means.

No one looking for clerical work of any kind should come to Canada without a good savings-bank account or influential friends. Any smart young man with a good education, who understands the decimal system of coinage, and who can afford to wait for some considerable time, may succeed in getting a very good situation; but as a rule, as there are so many looking for jobs of this kind, some have to wait a long time before their turn comes. A knowledge of the French language will also be very useful to any one looking for office or commercial life, especially in the eastern part of Canada.

The kind of people who are wanted in Canada, and who need not wait very long at any time to get work, are farm-hands, railroad and builders' labourers, and domestic servants. Wages run from five to seven shillings a day for day-labourers, without board of course, and from thirty to fifty pounds a year with board and lodging. The wise young man will hire out for a year when he comes here first; for, if he does, he is likely to have more spare cash, as a rule, at the end of the first year than if he starts to wander round any of the large cities looking for day-work. Many works are at a standstill during the winter months on account of climatic conditions.

The only industry in Canada that really requires snow and frost to make it flourish is the lumber business. Hard frost with a reasonable amount of snow is always necessary to make this industry a paying business. The building-trade in the cities starts in the spring and ends in the autumn (or the fall of the year, as we say in Canada). In new settlements, where the buildings are made of timber, it can, of course, be carried on in winter. The building-trade in a country like Canada, where the population is increasing rapidly, is a very important industry, more especially as many buildings are pulled down a few years after they are put up, and better ones erected in their place. In the city of Montreal, for instance, on St James Street, in the centre of commerce, most of the buildings that stood there when I came to Canada thirty years ago have been pulled down and rebuilt, some of them in the new style of sky-scraper, which I, for one, do not consider an improvement on the old style. I know of one building in particular that has within my recollection been twice rebuilt on the same site. This, of course, is a very expensive system, and it is carried on extensively all over Canada. It is a good thing for workmen, however, for it provides a great deal more work than if the buildings had been more substantial originally, like those in Princes Street, Edinburgh, or St Vincent Street, Glasgow. Navigation is, of course, closed during the winter months.

I would like to see more young men of good strong muscle turn their face toward the lumber-camps in Canada when they come late in the year, instead of wandering around the towns. They may be a little green at handling the axe at first, but after a month or so they become, as a rule, just as expert in handling it as the natives. House-carpenters will find it easier to get work from December to April than stone-masons; but their work will generally be a little slack in the spring, until house-building is well under way.

Though Canadians are proverbially touchy on the question of snow and ice, the fact of the matter is that heat, black flies, and mosquitoes are much more annoying to the labourer on the farm, in the bush, and on the railroad than either snow or frost. There are very easy and simple ways of protection against Jack Frost. But the mosquito! I shall never forget my first experience with it up on the Black River! It does not seem possible to invent any kind of protection that it is not able to get round. These remarks about mosquitoes, black flies, and midges apply only to the rural districts and the bush. Such visitors are seldom to be met with in large towns or cities. Our enemy the bed-bug is quite impartial in its choice of locality; it may be found in the bush or in the city; but it can be overcome by cleanly habits and constant shaking up and washing of bed-linen and bed-tick, and by the use of iron instead of wooden bedsteads. But all these methods of warfare are quite useless in combating mosquitoes and black flies. The mosquitoes take the palm; neither smoke, fire, nor grease will scare them, and they will sail right into you with their war-whoop unless you are completely covered up. I have not noticed any reference to these interesting features of Canadian life in the various circulars sent out broadcast to encourage emigration to Canada.

None of these little annoyances should weigh much with a brave young heart that starts for Canada with the intention of making a home for himself or herself. There is room and to spare for many millions of settlers, and the more of them that do come the better country will Canada be to live in. Though the weather sometimes changes very suddenly here, still there are not nearly so many winter storms as in

Scotland. As a rule, it is steady frosty weather with a clear sky all winter, with rain and thaw maybe twice or three times during the season. Of course cattle have to be fed by hand, and water got for them from a hole in the ice; which is also the only way any fishing can be done on the inland waters during the winter.

I have more than once referred to the touchiness of Canadians on the question of climate, and now I am coming to particulars that specially concern the business people of Montreal. I refer to our Winter Carnival, which was a side source of revenue to Montreal business people for some years. At one time we used to have an annual Winter Carnival in Montreal, including a large Ice Palace, which attracted many people from all parts of Canada and the United States. We expected that this would continue to be a regular feature in Montreal, and our merchants looked forward to a small annual harvest from this source. Railroad companies gave reduced rates, as they generally do on such occasions, for it was supposed to be in their own interest to do so. Strange as it may appear, however, the principal railway companies began to object to the building of ice palaces as a bad advertisement for Canada. We have, however, discovered the secret motive of this previously unaccountable opposition to the Ice Palace. The railroads wanted cheap labour from the south of Europe, and steamboat companies wanted summer passenger traffic from the same quarter, and they were afraid that pictures of Montreal ice palaces would scare the people around the shores of the Mediterranean, and diminish their trade; so our trade had to be sacrificed for the benefit of theirs. Then after a while Montreal became crowded with Italian unemployed labourers, and we had more crimes of violence in one year than we had in ten years before; and the worst feature in connection with these crimes, mostly cold-blooded murder, was that the guilty parties could seldom or never be brought to justice.

In the large cities—Montreal and Toronto are really the only two cities that would be called large, as cities are classified on the other side of the ocean—labour agitators are almost as busy as they are in the Old Country. This is more noticeable since about thirty thousand Jews, mostly from Russia, have come to Montreal during the last few years, in addition to ten thousand we had before. This class of immigrant cannot be set to work on the farm, the railroad, the lumber-camp, or in the building-trade. His ambition, almost without exception, is to engage in business. The only manual labour, if it may be classified as labour, in which he is willing to engage is tailoring. The Jew seems to be too weak in the muscle to hold his own with Gentile people in any kind of labour requiring physical strength. The Russian Jew will engage in work that an Irish or Italian labourer would not take kindly to, such as gathering rags, bottles, or bones; but he does not take kindly to the pick and shovel, or to the hand-truck unless to cart his own goods. I mention these facts to show one very useful class of men—the tailors in the British Isles—that they need not look to Canada to better their condition as things are now. There are various things in Canada that are quite different from the ways of the Old Land. Men are more likely to be asked to do what at home would probably be considered woman's work exclusively—such, for example, as milking cows. If any young man intends to come to Canada and look for farm-work, he should practise milking cows before he comes, so as not to be considered too green. He should learn to darn his own socks and mend his own clothes, unless he is prepared to throw them away as soon as they get holes in them. Canadian women will not brush shoes or mend the clothes of their lodgers as readily as do women in the Old Country.

If you want to keep your boots brushed and don't want to pay twopence-halfpenny every time you think they need a shine, you must provide yourself with brushes and blacking, for no Canadian landlady will consider it a part of her duty to keep you tidy in that respect. In the lodging-houses, if you board and lodge in the same house, you must pay so much a week, and be content with what you get. The Canadian landlady will not keep a pass-book for you and order what you want, and cook it for you, as has been your custom in the Old Land. You must just take what she offers or leave it, and if you don't like it you can just look out for another place, and there is no use discussing the question. You will not get a bowl of porridge for a penny and another bowl of milk for the same sum; you will get two spoonfuls of porridge and a little milk on the top of it for ten cents (fivepence). These are a few small details that prospective immigrants will find it useful to know, but which no information bureau in the Old Country has ever referred to, as far as I know. Yet they are all worth knowing. Whether young men in the Old Land have been spoiled by too much attention from the women, or whether Canadian women put on more airs, I leave other people to discuss. I have long ago got quite reconciled to the conditions that were at one time somewhat new and strange to me, and we have always got on quite nicely without any friction. Shortly after I came to Canada an old Irishman, who had arrived several years before, explained to me all these details, and I found the information very useful; and, knowing these things, I have always found Canadian landladies quite nice and easy to get along with, although I have been keeping bachelor's quarters in Canada for thirty years.

The Canadian woman is kept quite as busy in her own way as Old Country women. When women find more work to do of the kind that is peculiarly woman's work than there are women to do it, they must necessarily change their methods. In Canada, for instance, there may be only one woman, or at most two, in a farmhouse where there may be half-a-dozen or a dozen men; while in some places in Scotland, for instance, there are likely more women than men around the house. In the Old Land women have no stoves or stovepipes to polish, as in Canada. As a rule a Canadian housewife prepares a greater variety of dishes for dinner than a woman at home does. They all try to keep up some style. A common labourer's dinner of soup, meat, two kinds of vegetables, and a dessert means much more work for a Canadian woman than the average Old Country labourer's dinner of potatoes and herring, with maybe a cup of tea as a dessert. One meal entails more labour on the average Canadian woman than the three meals, breakfast, dinner, and supper, often entail at home. One man in a cheap restaurant in Montreal always gets twice as many dishes as the same class of food and service would involve at home. One thing particularly I would like to warn Scotsmen about, and that is never to expect to get the same kind of porridge and oatcakes in Canada as they have been used to at home. The same kind of oatmeal is never to be had in Canada unless imported from Scotland. Whether the fault lies with the grain or the miller I don't know. With the wheat produce it is entirely different. Canadian wheat cannot be excelled anywhere, and the loaves made in Canada always appear to me to be just as good as those that are made at home. But to a Scotsman there is nothing more disappointing than porridge that tastes so different from the porridge that he has been accustomed to. More than that, I have often looked in blank amazement at the large plate with two spoonfuls of porridge in the middle of it, and a small dish of milk containing also about two table-spooonfuls, and this for part of a Scotsman's breakfast! To make a reasonable breakfast at this rate you would need at least half-a-dozen courses. When it comes to dinner, sometimes you will get half a potato, a small dish of cabbage, and another small dish of corn. It has often been remarked that fewer dishes and more food would be better. I have never found the same flavour in the mutton-chops of Montreal as I have found in Glasgow; and as for herrings, I have long ago given up looking for them in despair.

The Canadian woman has difficulties of her own to contend with that women at home never experience, largely on account of the difference of climate. A Canadian woman has a great deal more trouble in looking after her children. They not only need shoes as at home, but they also, for a large portion of the year, require rubbers over the shoes; and children cannot go to school or run messages during the winter without warm gloves. To the poor this not only involves extra work, but also a good deal of extra expense. You can never get boots and shoes in Canada that will keep out snow-water in the spring and autumn, and so to keep your feet dry you must have rubbers over your shoes; and when it is frosty you must have them on to keep you from slipping. In the summer-time the Canadian woman has a great deal more trouble with house-flies than I have ever seen at home. So don't blame her when you come to Canada if she is not so attentive to you as was the Old Country woman. If she has children to look after, they are, if anything, more troublesome than children at home, especially during the winter. They all want skates and small sleighs to amuse themselves with. If the grocer is not next door, and she needs anything in a hurry, she must put on her shoes first, and then her rubbers, and then her warm gloves, unless she carries a muff, as it is generally freezing hard all winter; but occasionally there is a thaw, and the thaw always causes some new trouble, for it discovers all the holes in all the rubbers of the whole family, so that means some more expense for new rubbers. If there are any growing girls going to school, they must have a piano. I have often seen a Canadian mother cooking for a number of boarders, and the daughter, whom she wished to make genteel, playing on the piano. Then the church expenses are a great deal heavier than at home. A small village of six hundred people very often has five or six different churches where one might do if they could settle theological differences.

On account of so many factories shutting down every winter, many labourers come from Europe in the spring and go back in the autumn. 'John,' said a young married woman to her husband in a small village in which I once lived out West, 'if you cannot make a better home for me than this I will go home to my mother;' and she said it in a calm, business-like way. This type of woman is not yet quite so common in Canada as she is in the United States; but a young man who marries a girl on short acquaintance on this side of the Atlantic is more liable to meet with an adventuress of this kind than at home. I notice a bright Scotch lassie serving in a restaurant with a Yankee name, financed by Chinamen, where I take my meals sometimes, and the earnestness she puts into her work in comparison to some of the native girls is a study to me. The tendency here to change places of residence and work and friends, often for slight reasons, does not make for the higher development of the race. I am comparing in my mind the type of people who have taken *Chambers's Journal* from me for twenty years with others.

They stick to their employment and their friends and high-class literature, and are fairly successful; others—well, they drift to nowhere. Many have not got enough salt in their blood. Moral: Stick to your duty, your friends, your work, your study of high-class literature, and your country's flag wherever you go. That is how we Britons got there.

THE CAHUSAC MYSTERY.

CHAPTER XXII.—LORRIE.

IT was a cloudy day of damp heat. Two or three weeks had slipped away since Cahusac's interview with Sir Berritt, weeks entirely barren of result as far as any increase of information was concerned, and yet Malcolm had spent himself, mind and body, in efforts to attain it. He had crossed to Paris, only to find that Puyfot was no longer there. But though Cahusac could gather no further knowledge of the facts connected with Sir Malcolm's death, he became more than ever convinced that the key to the situation lay between Puyfot and De Sarsan. Patiently he unravelled the tangled lines of loose gossip in the papers, and each led him back to Puyfot.

On his return to town he found that, as Fraynes had foretold, people were beginning to find it curious that he had not at once taken action against the *Gas-Lamp* and its confrères. It appeared inconceivable that he should allow such a calumny to pass unnoticed. As the story drifted from tongue to tongue, some one made the inevitable inference that either he was callous beyond belief, or that he had cause for keeping silent; and, though little showed on the surface, Malcolm began to be conscious of a cooling of manner and regard among his acquaintance, while his own connections openly blamed him.

Yet he could do nothing but wait upon chance. Although he had so strong and unfortunate a reason for his present attitude, he was nevertheless by no means without a definite plan. That plan was one to which all strong natures come when balked by circumstances. He would put his trust in the strength of his own hand and brain; he would, he must in the end, mark down the murderer of his father, and, armed with that knowledge, he had no doubt whatever that he would have the power to take the situation into his own hands.

But just at this period he could not quite see the next step he should take. Happening to glance through his invitations, he was forced to acknowledge that they had of late grown fewer. His eye lit on one which he had accepted a month previously. It was for the same afternoon—a huge garden-party that always formed one of the events of the season. He was in the mood to see how society would treat him, and he set out with something of curiosity and, it may be, more of defiance in his mind.

His destination lay in the outskirts of London, where the din of the City, like the hum of a shell, was audible only to the listening ear. In the level light the grass still looked green and vivid, but the leaves upon the trees showed dark with the premature aging of city foliage.

Cahusac, seeing at once that his appearance created much inquisitive interest, passed from group to group, taking each cold look with apparent indifference, and making believe to himself that each was but a fresh satire upon the ways of the smart world. Frigid greetings, for the most part, were his lot. Presently he saw a small throng of people, just such a knot as forms itself about a favoured person whom society for the time being delights to honour. Stragglers from other parts of the lawns were here, those who had seen the cold shoulder turned upon him elsewhere. He recognised several, for nervous susceptibility gives a man a hundred eyes; and knowing that the whole group were not about to be taken by surprise, but were prepared with their reception, he sauntered towards them with some dim idea that it would smack of cowardice to retreat.

But before he reached them, four people, walking together, came out from behind a flanking bank of rhododendrons and met him face to face—Mrs Westaway, De Sarsan, Wil, and Alice. The girl made an impulsive movement towards him; but De Sarsan, bending nearer to her, uttered a decisive word or two. Cahusac saw her hesitate; she gave him a piteous look, but she turned away with her companions.

No blow yet struck at Cahusac had wounded him quite so sorely, but not for himself—the stab of pain it inflicted hurt him most for Alice's sake. They must, at last, have persuaded or compelled her to give De Sarsan the right to impose his will on her actions. Poor gentle Alice! and there was no one to save her from her fate.

He saw Wil say an angry word or two, and before the Belgian could stop him turn to retrace his steps. 'Look here, Malcolm,' he panted.

Cahusac stopped.

Wil was looking more than usually pale, and his height added gauntness to his figure. 'I want to say that we do not wish to continue the pleasure of your acquaintance.'

Cahusac made no reply, but began to move on.

'D'you understand?' went on Wil, irritated by Malcolm's casual reception of the affront.

'You are not to speak to Alice again. It's hardly decent for a man in—in your position to force yourself into the company of respectable people.'

'What is my position?' Malcolm faced him.

'Hang it all! you know what the papers and everybody are saying,' stammered Wilford.

'What are they saying?' inquired Cahusac calmly.

'That you dare not go to law with those papers who are blackguarding your father, that there's some queer story behind it all, and that you've got to put up with the worst they can say. See? And in spite of that you have ventured to think of Alice! But she's going to marry De Sarsan! And jolly lucky to get him, and to escape such as you—you—and your father!'

'Stop, this instant!'

He met Malcolm's eyes, and the flare dropped from his own. He stood without speaking for a moment; then he moved away in the wake of his party.

Malcolm walked on. The incident had stirred him to wretchedness, but it also urged him forward. The little crowd ahead watched his approach as Cahusac advanced with an air of absolute self-possession.

Suddenly from the heart of the group, one figure detached itself and came towards him with that peculiarly graceful carriage for which American women are remarkable.

'You are late, Mr Cahusac,' said Lorrie Madesson. 'I have been expecting you all the afternoon.'

The incident took him unawares. 'Have you heard'—— he began.

Without replying at once, she led him away across an open space of greensward. Presently she said, 'I have heard everything that has been said or written about you during the last few days.'

'A good many people have failed to see me this afternoon, and—and—you are very kind, Lady Madesson; but you must allow me to bid you—good-bye.'

Lorrie laughed. 'You cannot get rid of me so easily.' Then she added in a different tone, 'I imagined that you and I were fighting out this trouble together.'

'No, no!'

'We made some such compact months ago, didn't we?'

'I had no idea matters would go so far,' he expostulated.

'I should be a poor sort of partisan if I deserted my side at the first hint of unpopularity.' She smiled.

'I understand your generosity, but I will not allow you—to be mixed up in this unfortunate affair.'

'You are under my orders at this moment,' she said peremptorily. 'You do not know in what way I have been working for you, and the least you can do is to act as I wish. Come!'

Up and down the lawns the couple passed, Cahusac suffering infinitely more now than he had suffered when alone. His pride, his generosity, and his manliness were all on fire. Lorrie—a woman—stood between him and the world! He could hardly endure it.

The ordeal came to an end at last. Lorrie took leave of her hostess, adding that she was going to drive Cahusac back to town.

In those days motors were rare; but Lady Madesson, sharing the aptitude of her race for making trial of all things new and likely to be good, already owned one of the best French make. Into this she swept Cahusac, and the car glided down the long windings of the drive, through the heraldic gates, and so on towards the slowly increasing roar of London. The outlying and scattered houses of the suburbs drew into the closer ranks of streets, and these again joined one to the other in continuous lines and cross lines, till they showed the density of building which distinguishes the chief human ant-heaps of the earth.

All this time the two occupants of the car sat silent—Cahusac because at first embarrassment, and, it must be owned, a certain vexation, hindered speech; later, because he became obsessed with painful thoughts, of which the knowledge of Alice's engagement was foremost. Lorrie took care not to interrupt his reverie, but she was not blind to his vexation. She knew that must quickly exhaust itself; as for the smouldering of bitter thoughts, she hoped to fan them into words. She was a wise woman, who understood the worth of the old adage, 'Hurry no man's cattle.'

Presently leaving Holland Park Avenue behind, they reached Kensington Gardens. Lorrie stopped the car at Porchester Gate.

'I am going to walk home through the Gardens,' she said. 'Will you come with me, or can the car drop you anywhere?'

Cahusac woke almost with a start from his abstraction. Lorrie's lovely eyes of deep blue were not to be resisted.

'With you, if I may.'

'We can talk in peace now,' she said as they walked side by side. 'Why would you not come to see me before you left for Paris? Oh yes, Colonel Detching told me!' She wanted to rouse Malcolm, and trained her guns right to the heart of the subject.

'I felt I had no business to worry you with my affairs,' he replied in a little confusion.

'That was ungracious of you, to say the least of it.'

'It was churlish! I see it now,' exclaimed Malcolm. 'Unpardonable!'

'Very nearly unpardonable. Besides, as a matter of fact, you caused me a good many bad

half-hours which you might have saved me,' she rejoined dryly.

'How? How could that have been?'

'Perhaps I may tell you presently. But I can assure you they were really very bad half-hours.'

'But why should you trouble about—my—the matter?' he stammered.

'The insatiable curiosity of a woman, I suppose,' she said; and Malcolm looked down keenly at her. Was it possible that Detching the faithful had so far betrayed him? But no; she was speaking naturally. 'I think it began with Guy's words. Do you remember them? "I'll back London to keep her secret." I think I want to prove if London can.'

'She can!' returned Malcolm with conviction. 'One may now and then escape by chance, but she holds most of them too close.'

'She shall not hold this one!' exclaimed Lorrie. 'You and I and Colonel Detching are three people who do not like being beaten.'

Her look and tone more than the words sent a thrill of hope through Malcolm; he recognised the next instant that it was quite an emotional and unreasonable hope, but it remained with him all the same. In his conclusion, he omitted the fact that a gallant spirit gives out some indefinable quality which leads to victory more often than is ordinarily realised.

'If you can spare the time we might sit here, and I will tell you what I have done since that evening when you first spoke to me of M. de Sarsan,' he said aloud.

They made their way between the trees to the nearest chairs. To Lorrie came a keen remembrance of their last conversation by the Kensington Palace walk; but she could not flatter herself that any such thought occurred to her companion, who was manifestly engrossed with the present moment.

'It was wonderful of you to guess that he was the man!' continued Malcolm. 'I have been following up the clue you gave me, and every point I discover only makes it more certain. He is undoubtedly a secret service agent, working for himself, not for his country—which is the only palliation one can find for the career of a spy. But I never get beyond the fact of his enmity to me. I know he hates me, but I cannot find out how he comes to have so complete a knowledge of all those events in the past.'

'To begin with, I believe he took his part in all those events! I believe he was present. I believe he—— Oh, I can put no limit to my belief in that man's wickedness!' exclaimed Lorrie.

To her amazement, a look of actual horror spread over Malcolm's face.

'Good God! you must be right. You've been right before! And that scoundrel is going to marry Alice!'

'Not Alice Lanceley? I have heard nothing of it.' But her voice, though shocked, was a little cold.

'Wil told me at the Sheringhams'.' He was about to say more, but checked himself.

'What a dreadful idea!' The coldness was gone from Lorrie's voice. 'Poor little girl, she does not deserve such a fate.'

Cahusac had taken off his hat, and now he passed his hand hastily over his hair with a helpless, yet desperate, action that brought Lorrie to the verge of laughter and tears. She loved the man, loved him and pitied him, and was half-angry with him for the folly of his infatuation for Alice; but above all she felt the mother-longing to make his path of life straight and pleasant once again, to see the careless happiness in his eyes that she remembered seven years ago during their voyage from the States. In that instant she realised how much she was ready to sacrifice for him. Life! That would be little indeed! But there were other sacrifices far harder to make. Would any one of them be beyond the measure of her love?

'Do you know,' she said in her soft voice, 'you have never really told me anything about your father's death? I am quite sure that I can help you, but you will make it far easier for me if you will tell me the story of all that has happened.'

'It is only too good of you to listen to it,' he said, and forthwith began.

He told her of Sir Malcolm's murder, of the fruitless efforts of the police to find any trace of the murderer. He told her of the mysterious visitor who carried so terrible a tale to Lady Cahusac's ears in the first hours of her loss, when, distracted by grief, she yielded to the demand for blackmail, which she continued to pay practically to the last. The single fact he withheld was the nature of the blackmail the unhappy lady had paid; he could not bring himself to let fall any hint of that, nor indeed did he think it necessary. He went on to tell of his return from America, of his premonition of misfortune on that evening, of his step-mother's disclosures, of her obstinate refusal to reveal the name of the blackmailer, and of her discovery of those important letters which were to be their release from the exactions to which she had so long submitted.

'I remember going into the library and turning on the electric light just above the cabinet. I had the key in my hand. I put it into the drawer and pulled the drawer open. I saw the two letters tied together with thin cord in a very flat packet, and had them actually in my hand. After that I remember no more until I saw Detching's face hanging over me with an expression I'll never forget, half of pity, half of a piercing inquiry. Then his face altered, but that first look left us friends from that day to this.'

'You were lucky in that at any rate!' said Lorrie definitely. 'He is the best friend I know of.'

He turned to her with eagerness. How beautiful she looked! She was wearing a large hat of a deep blue that matched her eyes and enhanced the exquisite colouring of her face. 'Could it be possible that Detching had a chance?' he thought. 'I wish he could hear you say that!' he exclaimed.

She smiled as she met his glance. 'He has heard me,' she said.

That was all, but Cahusac knew that his friend's dream was hopeless, and that Detching understood it was so. Cahusac made haste to continue. He felt as if he had surprised a secret. 'I had been knocked down by a blow on the side of the head, and the robber, in making his escape, struck at my step-mother also. He missed her, but the door-frame showed a deep mark. The letters were gone, but nothing else had been touched; so we may fairly conclude that whoever took the letters must have been the one person to whom they were essential. My step-mother died a few weeks later; she never spoke a sane word after the terror of that night. But she had been in bad health and much harassed for many years.'

'Harassed for years! Ah yes!' sighed Lorrie, who had in the past learnt the meaning of those words.

After that there was little more to add, for she knew all about the paragraphs, and from Puyfot she had gained some knowledge of the incidents of Cahusac's visit to Paris. He now added a description of his meeting with De Sarsan, and the strange fact that De Sarsan should have sent him to Puyfot.

'I can account for that,' said Lorrie. 'It was a bold move to put you off the scent, and he knew that Puyfot was in his power and dared not betray him.' She laughed. 'When you told me some time ago of Puyfot's tragedy, *Astoreth*, I wondered if you were not going to mention this, which after all is the only thing about the man that would have given me interest to hear. As a matter of fact, I have made the acquaintance of Monsieur Puyfot myself.'

'You know Puyfot?' said Malcolm. 'Why, where in the world could you meet him?'

'At my own house. He has come to London, and *Astoreth* is at this moment under favourable consideration at the Athenia.'

'So Puyfot is in London?'

She nodded. 'I can give you his address. He is at an hotel near Leicester Square. Has it not struck you that there is a good deal to be learnt from Monsieur Puyfot?'

'Probably everything, if only I could meet him as an ordinary acquaintance; but in my own person it would be useless. That is the difficulty.' He gazed at the ground in deep thought. 'I saw Fraynes, who is the head of my department, to-day. He was kind; but he told me plainly that I ought to do something definite in the way of rebutting these libels.' He looked at her with some embarrassment. 'As matters stand, Lady Madesson, I cannot proceed against those papers for libel. The loss of the letters I have been speaking of was fatal, as without them I could not make good my case. Besides, frankly, there is another difficulty that stands in the way. I can't move because of it. The truth is, I am powerless until I can produce evidence of positive facts. With that to back me, I could act.'

'I wish I could help you!'

'Oh, but you can! You have already helped me! Detching was right when he said your head was worth both of ours put together! I have three months' leave, and I am going to use it in the way you advise.'

'But I have not dared to offer you any advice!'

'I think you have, though. Well, I will keep you informed of what I am doing; and you will set me right when I go wrong, won't you?'

She felt a throb of triumph. He was now begging the help he had tacitly refused at the beginning.

'I have not much time to spare on my own account, but there is none at all to spare if I am to save—Alice,' he added. 'You remember calling her a special friend of mine long ago? I fenced with the question then, but I may confess to you now that if I had not been held back by a fear of this happening which has happened I should have tried my luck.'

Lorrie stood up. 'We must make a good fight of it for her sake,' she said very gently; then turning on him, 'I was right when I told you, oh, years ago! that you were part of the feudal system; but you are more, you are worse! For you are fixed in a rigid vice of conventions! You refused happiness for yourself, and perhaps for her too, because of an idea—and left her to fall into the hands of such as De Sarsan!'

An expression he could not fathom had sprung into her face.

'What else was possible?' he rejoined, and his face was a revelation to her. 'I had faith in right once; I believed that truth was possessed of an inborn power, that it could not be hidden for ever. But I was wrong! I may carry a smirched name to my grave, and my best hopes lie in self-effacement and obscurity. A gulf is open between us, between Alice and me. I could not ask her to share my life—now, as an honourable man, I could not!'

Lorrie's glorious face was lit by a glow of indignation. Malcolm, too absorbed in his own line of thought, scarcely noticed it.

'Honour!' she repeated. 'While you know yourself to be what you are, and De Sarsan to be what he is, you still call it "honour" to leave

her to be his wife rather than make her yours! You tune your life to the false key of the world's opinion, not to the only honest or reasonable opinion possible! I have no patience with your spurious ideas of honour!'

He heard her out, his handsome mouth set. As she put the case, and with the charm of her personality kindling the words, all that she said seemed true—tremendously true; but——

'But if I could bring myself to go to her to-day,' he said, 'how do you suppose Alice would meet me? You know what Wil thinks. What would she say?'

'I cannot tell. She may be hide-bound by convention, as you are. But if she loves you, and if she is worth—anything,' Lorrie rejoined with a lovely thrill in her voice, 'she could give you only one answer.'

Before he could speak he found himself gazing at the back of a hansom which was carrying her away to Devos Square.

(To be continued.)

BIRDS' EGGS AND NESTS.

By the Hon. GLADYS GRAHAM MURRAY.

THOSE who believe in the spontaneous generation of life are probably few and far between; the keystone of their opponents' creed is *omne vivum ex ovo.*

The late Professor Bell Pettigrew published a most fascinating and arresting work upon the theory of design in nature,* and there he who runs may read of the author's firm belief in 'the eternal fitness of things.'

To-day is an age of equality; consequently the belief in a Designer and Creator of nature is disavowed, though with the believers in the creed formulated by Professor Haeckel the average amateur has no dealings. To the humbler and less exalted lover of nature there may well seem a glory and grandeur in the belief of a personal and intelligent Creator, a belief which has no parallel in other philosophies; for the quiet observer and would-be naturalist may rest content with the lines of the late Laureate:

> Flower in the crannied wall,
> I pluck you out of the crannies;
> I hold you here, root and all, in my hand,
> Little flower; but if I could understand
> What you are, root and all, and all in all,
> I should know what God and man is.

It is therefore interesting to study the subject of birds' eggs, their shapes, colours, &c., with a view to tracing some theory of design in their differences.

Birds are not the only egg-layers. Fishes lay eggs, as do also snakes, turtles, alligators, crocodiles, and great numbers of invertebrates. These eggs, however, are not covered over and protected by a hard calcareous shell, the variations of which make the eggs of different birds so fascinating to study.

One of the most noticeable points in birds' eggs is their differences of shape. No doubt the different adaptations of birds have in the cycle of ages caused different families to evolve different shapes of eggs, a particular design being more appropriate for some conditions than others. For instance, the pear shape is very characteristic among birds' eggs. With certain sea-birds—notably the guillemot—which breed on narrow ledges of high and perpendicular cliffs, this pear shape is carried to an extreme; were it not for this fact, doubtless a far greater number of their eggs would roll off and be dashed to pieces on the rocks below. As it is, owing to this peculiarly pointed shape, these eggs, when disturbed, spin round and round in a small circle instead of rolling off the breeding-ledge. This pyriform shape is found also (though to a lesser degree) among the plovers and sandpipers, and serves a useful end; for the four eggs being laid so that their points meet in the centre, the small body of the parent bird is able to cover them all at once, which would not be possible were they of a different shape. The owl, on the other hand, lays a roundish-shaped egg, as do the kestrel, sparrow-hawk, and other 'diurnal birds of prey.'

Among the smaller birds, the swift lays a very pointed egg, whilst those of the tits are much rounder. One of the most curious of eggs is that of the kiwi or apteryx. This bird, a native of New Zealand, is of nocturnal habits, and lays one or two white-coloured eggs; but the curious point is the size of the egg, which is out of all proportion to the bird. It is so large that it is affirmed that the egg cannot be replaced in the skeleton without breaking or displacing one or more of the bones.

The most attractive feature of many eggs is their beautiful colouring—for sheer beauty of colour what can surpass the lovely blue of the egg of the hedge-sparrow?—whilst thrushes and redstarts both affect a greenish-blue colouring. Tennyson, who constantly refers to birds in his poems, writes of 'the plain egg of the nightingale,' in which lies hidden 'the music of the moon.'

As a general rule it will be found that eggs laid in tunnels or burrows are white, often with a highly glossy, polished surface. For instance, woodpeckers, owls, kingfishers, parrots, puffins, and trogons all lay white eggs. But, on the other hand, many white eggs are laid in open

* *Design in Nature* (3 vols., Longmans & Co.).

situations. Doves and pigeons have the whitest of eggs, and their nests are as a rule never hidden. Herons, egrets, pelicans, storks, swans, and geese all lay white or light-coloured eggs. The grouse lays eggs of a dirty brown colour, with umber spots; whilst the peregrine falcon's are of a rich red colour, with darker blotches and clouds. The egg of the yellow-hammer is covered all over with streaky lines as though it had been written upon, and those of other buntings are similar in pattern.

The protective colouring of some birds' eggs renders them almost invisible; for instance, the ring-plover nests on the shingle, and the eggs so completely harmonise with the surrounding pebbles and stones that it is often almost impossible to 'spot' them. The green plover also derives great advantage from the mottled shade of its eggs, which are singularly inconspicuous on the ploughed fields and rough wastes where they are laid; but, on the other hand, there are many eggs which stand out conspicuously against the background of the chosen nesting-sites. The wood-pigeon deposits its white egg in the openest of nests, while those of the thrush and blackbird also are easily to be seen.

The colours of eggs have been examined under the spectroscope, and were found to consist chemically of seven pigments: (1st) a brownish red; (2nd and 3rd) delicate blues; (4th and 5th) clear yellows; (6th) a peculiar brown hue; and (7th) an indefinite shade known as lichen ixanthine, which is identical with a colour-substance common in plants, especially in lichens and fungi.

It is pointed out by physiologists that these substances somewhat resemble those found in the blood and the bile of human beings. They are deposited on the shell whilst the egg is passing down the oviduct, and it is due to the circular motion of the egg that the curious scrawls and blotches upon some eggs are found. The shell is deposited in successive layers, and sometimes the pigment is partly concealed by the outermost layers of the shell. The shell is chiefly composed of carbonate of lime, which varies in texture, the surface having in some cases a high gloss, in others a loose and chalky appearance. The shells of ducks' eggs are found to be impregnated with an oily substance, which must doubtless be of great use in resisting the moisture of their surroundings.

The grain of different shells, as seen under the microscope, varies considerably. The eggs of the North African ostrich have a smooth, ivory-like surface, whilst those of the South African are seen, even by the naked eye, to be deeply pitted. In the shell of the guillemot's egg air-cells are to be noticed when examined under the microscope.

The number of eggs laid by the different birds has generally been found to bear some relation to the amount of danger to which the species is exposed. The average number is, roughly speaking, about five. Hawks and owls generally deposit about this number, as do also a great many of our little singing-birds. Sea-birds, on the other hand—penguins, gannets, puffins, auks, petrels, and guillemots—generally lay one egg, though the gull tribe deposit two to four as a rule. The game-birds lay a very large complement of eggs, varying from eight to sixteen or eighteen, whilst doves and pigeons lay only two. From these few examples it will be seen how the various groups of birds differ, and how there is no hard-and-fast rule which holds good in every case.

Most eggs are hatched out by the warmth of the body of the hen-bird, who sits for several days upon the eggs, the period of incubation differing among the various birds. On the soft bill of a newly hatched chick being examined, there will be found at the tip of the upper half of the mandible a tiny hard nodule which is known as the egg-tooth; this acts as a file to the imprisoned chick when it is chipping its way out of the egg, and, since it has no further use in life, it completely disappears long before the bird reaches the adult stage.

There is a great difference in the state of different birds on hatching. For instance, the young of hawks, herons, gannets, crows, and our song-birds are all hatched in a more or less helpless state, some being blind and naked. They are quite unable to leave the nest, and are entirely dependent on their parents for food and protection. On the other hand, the domestic chick, young ducks, plovers, ostriches, and so on are hatched in a far more advanced stage, and are able to fend for themselves at once.

Among most birds the duties of incubation fall to the hen, but there are many exceptions to this rule. In Britain the eggs of the red-necked phalarope are incubated by the cock-bird, but it is chiefly among foreign birds that this habit is found to exist.

In hot countries birds are very often the makers of artificial incubators; in the case of the Moleo birds, of the island of Celebes, the nesting-site is chosen in a beach of loose black sand, a hole of three or four feet is excavated, and in this the eggs are deposited at intervals of about a fortnight. These birds do not brood, and the hatching of the eggs is, therefore, due to the warmth of the sand and the powerful sun-rays.

The brush-turkey, of Australia, is one of the mound-builders. These birds construct huge mounds of leaves and grass, and the warmth produced by the fermentation of this vegetable matter helps to hatch out the eggs.

Among ostriches the cock-bird digs a hole, in which the hens lay, all in the same nest—fifteen to thirty eggs being found—and the duty of incubation falls chiefly to the cock.

No egg is hatched under more curious con-

ditions than that of the emperor penguin of the Antarctic regions. It lays its large single egg on the sea-ice, with a surrounding temperature of fifty degrees below zero; but nature has not allowed this bird to perish, and the parent bird keeps the egg off the ice by placing it on the upper side of its feet and covering it from above by a feathered fold of skin.

To pass from eggs to nests is the next step. There is an immense difference among the architectural designs of different nests. Some birds form hardly any nest; others again build most elaborate structures.

The green plover lays her eggs on the ploughed field, in any little cup-shaped depression; whilst those of the ringed plover are deposited on the bare shingle. Coots make a large nest of rushes, in which their eggs are found. The typical duck's nest is more cup-shaped, and as incubation proceeds is plentifully lined with down. The chaffinch weaves its nest of scraps of lichen along with green moss, and then felts it into a compact cup-shaped dwelling, lined with hair and feathers. The goldfinch has a shallow but beautifully woven nest of fine roots, twigs, lichens, and grasses, and lines this with wool, feathers, and vegetable down interwoven with horsehair. The thrush's nest is a very thick and substantial affair, the outside being composed of grasses, moss, and fine twigs. For the inside lining the bird makes a plaster of clay and wet mud, with odd fragments interwoven; then she moulds the nest into a hollow cup-shape by pressing the damp sides with her breast. The willow-warbler and chiff-chaff have ground nests, generally sheltered under some hedge or bush; and these are also composed of dry grasses, moss, and dead leaves, with a lining of horsehair and feathers. The reed-warbler's nest is of a deep cup-shape, woven round the stems of three or four reeds, which thus form an elastic support for the structure. The depth of the cup prevents the eggs from rolling out even when the reeds are bowed by violent gusts of wind. The nut-hatch chisels out a nest for himself inside a tree, and if the entrance is too large he partially fills it up with clay, lining it with dried leaves, moss, and bits of thin bark. Among the tits, the long-tailed is the cleverest builder. Its nest resembles an oval ball, and is placed in the branches of some low tree or bush. Near the top of this ball-shaped dwelling—which is composed of moss, wool, and lichens all worked together, often with the addition of cobwebs and gossamers—is a small hole by which the birds go in and out. The inside of the nest is literally a feather-bed, and hundreds and hundreds of little feathers are massed together. The swallow and the house-martin build their nests of mud or clay, whilst the sand-martin tunnels its nest in some natural sandbank or cutting. The kingfishers also tunnel out their nests, and their eggs are laid on the pellets which these birds disgorge; whilst, among sea-birds, the puffin lays in rabbit-burrows. The golden eagle has a very huge nest, usually perched on some inaccessible crag, and constructed of large sticks; whilst the peregrine falcon commonly lays in any suitable hollow on a ledge of rock. The sparrow-hawk often lays in the old nest of a crow. Each one of these birds, therefore, shows a difference in its architectural powers; but it is perhaps to foreign birds that we must turn in order to find the master-builders in nest construction.

The tailor-bird, a native of the East Indian region, actually sews together its own nest. By means of its beak it pierces a row of holes along the edges of conveniently hanging leaves, and then, with the fibre of some plant, it sews these together, forming a bag-shaped sort of nest, which is lined with soft white down, and swings from the branch on which the leaves grow.

The weaver-birds, inhabitants of Asia and Africa, have curious pensile nests, which are slung from the branches of trees. The sociable weaver-bird builds a joint-nest, like a thatched roof, in a tree, the different pairs occupying separate nesting-holes in the thatch.

The bower-birds of the Australian region, while they build nests in no way specially remarkable, have the extraordinary habit of constructing 'bowers' decorated with small, bright objects of various kinds, and used by the birds as playgrounds. Among these the gardener-bird seems to carry the instinct for decoration to the highest pitch, employing flowers and bright-coloured fruits to adorn his 'bower.'

The red oven-bird of South America owes it name to the oven-like shape of its nest, which is composed of clay, and set conspicuously upon a bare branch or post; an internal partition divides the nest into an inner and an outer chamber, the eggs being laid and hatched in the former.

Every one has heard of bird-nest soup, which is made from the nests of the awkwardly named 'edible' swift, a bird which is widely distributed over the islands of the Indian Ocean and the Pacific. The nest consists chiefly of mucus secreted by the salivary glands of the bird. These swifts breed in caves, which they occupy jointly with bats, 'the mammals,' as Professor Newton puts it, 'being lodgers by day and the birds by night.' The collection of these nests for the Chinese market forms an important branch of industry where the birds abound.

Humming-birds—which, as their structure shows, are allied to the swifts—form tiny cup-shaped nests, suspended from leaves or branches, and barely sufficing to hold the two minute, pure-white eggs.

These are only a few instances taken from a multitude of others which are equally wonderful to consider. There seems at first to be an immense difference between the skilfully constructed nest of the little reed-warbler and the rough hollow made in the ground by the lapwing; yet

both of these birds fare equally well in the struggle for life, and what is necessary for the one would be harmful to the other. Nature solves her own puzzles, but how she works them out is not always vouchsafed to the onlooker to understand.

Quam magnificata sunt opera tua, Domine!
Nimis profundæ sunt cogitationes tuæ.

SOME ADVENTURES OF SERGEANT SPARKS, OF THE MOUNTED POLICE.

I.—WHISPERING DEATH—*Continued.*

A MONTH passed before we heard again of Pollet, and if he flattered himself that I was sick with suspense he was vastly mistaken; for I knew now that moonlight was essential to the success of his scheme, and as there was no moon I had no reason to feel uncomfortable.

Then, one evening when the moon was again at the full, began the end. I reached home just before supper, and Foster ran out to meet me.

'We've got him!' he cried excitedly. 'Read that.'

It was a note to me, and contained the information that Bobby Pollet was back in his hut on the edge of the Rosewood Scrub. There was no signature, and the flimsy pretence should have deceived no one. I did not doubt that Bobby had returned, or that he had informed on himself in the hope of leading me into a trap. It was perfectly clear.

'Brought by a black "boy,"' Tom went on, his eyes dancing at the prospect of a fight. 'I couldn't pump him, for he neither spoke nor understood English.'

'You ought to have detained the man, Tom,' I said. 'Do you believe that at this time of day, and in these parts, there is such a thing as a blackfellow entirely ignorant of English? Well, it can't be helped.'

Tom's face fell. 'My word! I never thought of that. Anyway, he cleared out like a shot.'

'He naturally feared your astute cross-examination,' I laughed; and Tom, grunting, walked off with my horse.

After supper I stated my intention of riding alone to the Rosewood Scrub, a decision against which Foster protested hotly.

'We believe that a trap has been set,' my anxious henchman cried. 'Is it likely that Bobby will be the only one waiting to watch it sprung?'

'I think so,' I answered. 'This scheme is Pollet's very own. He is the last of the gang which he desires to avenge, and I do not believe that he will share his pleasure with any one.'

'You don't know what he has in store for you,' urged Tom; 'so take one of us, or, better still, both of us.'

'No,' I granted, 'I don't know what is to follow the final manifestation of the whisper and the shadow; but, all the same, I am going alone. They will perhaps materialise.' I laughed, unconscious how near the truth were my words.

'Dinna bother the sergeant, Tom. His mind 's made up,' Macneil said, with a docility which caused me to glance suspiciously at him. I should have ordered them not to follow me; but I did not wish to hurt their feelings, and I never supposed that they would take the law into their own hands. So I refrained, and well it was for me that I did.

The moon was high when, after my ten-mile ride, I made out the dark line of the scrub barring the landscape like a huge snake writhing away to the north. My brain had not been idle; but, think as I would, I could not imagine what was to follow the final performance of the trick. That the danger lay in the whisper and the shadow themselves never once struck me. I gave up puzzling at last, and carefully examined my revolvers, so as to be ready for whatever method of attack might develop.

I did not trust myself too near the gloomy scrub. I had nothing to lose by being seen, and I kept well away until I was exactly opposite to, and a quarter of a mile distant from, Pollet's hut. Then I turned Black Knight's head towards the shanty, and rode forward at a walk.

I wish you could have seen that horse of mine, Black Knight, in the pride of his youth, when he would do for me—well, almost everything but talk; and he made shift in his own way to do that. I have often wondered what would have happened that night had I ridden a horse less perfectly trained and less obedient.

My idea was to dismount outside revolver-range, and then carry out a simple device for my own protection as I neared the hut; for I had no notion how many might be lying in wait within or behind it. So deserted did the place appear that I wondered whether I had not come upon a fool's errand. The silence, too, affected me; and I felt, to my deep disgust, the oppression of that old sensation of nervousness which I had so fully experienced on first encountering the whisper and the shadow. Strive as I would, I could not shake this feeling off, and I asked myself at last, in fierce scorn, whether I was not, after all, a coward.

But soon all power to think or to act deserted me; my brain seemed occupied to bursting by a

single pair of ideas, which expressed themselves in five words that hummed continually in the silence and hammered at my ear-drums till I felt the physical pain of the dreary repetition: 'Dancing shadow and whispering death!' over and over again, and yet again, as, with eyes fixed upon the lonely hut, I advanced to—what? By that time I was beyond speculating; but, could I have done so, my wildest imaginings would not have approached the fantastic truth.

No chirp of insect, no hoot of night-bird, not even the soft breath of a breeze upon the tired leaves, disturbed the heavy silence; yet the air seemed full of that dreary song, from which that one syllable detached itself and roared at me with terrifying persistence, 'Death! death! death!'

Then into the midst of this noisy silence was projected, with a suddenness which sent every fancied sound flying, a human voice, deep-toned, growling: 'Thrice! Beware the shadow and the death—the whispering death! It is the end!'

Squeals of maniacal laughter followed the warning, and I, brought with a snap to my senses by the shock, and feeling sore and ashamed, peered at the hut, striving to materialise Pollet out of the deep shadows which flanked and backed it.

The shrill laughter ceased as suddenly as it had begun, but was instantly replaced by that distressing sound which I had been warned I was to hear to-night for the last time.

Whisper! whisper! whisper! just as before, circling, circling, drawing nearer at every second; but—and I thrilled with satisfaction—no longer having power to harass me with its dread suggestion.

With the reins upon Black Knight's neck, my hands grasping the butts of my revolvers, I waited for whatever was to follow, and smiled to see my good horse so steady. My smile soon faded. Like many another, I laughed too soon.

What was that? Surely not—it could not be—yes, it was another of those horrible whispers, now distinct from, now blending with, the first; and, even as I realised this, I was conscious of a third, a fourth, a fifth, a sixth, coming from every direction.

Whisper! whisper! whisper! from right to left and behind, from left to right and in front, high in air, lower down on different planes, till the horrid sounds seemed just above my head; lower still, about the level of my shoulders; lower still, at the level of Black Knight's back; circling, circling—whisper! whisper! whisper! till the circumambient air seemed filled with hissing snakes threatening to fold me in their strangling coils.

My heart began to beat violently. I made a fierce effort to subdue the temptation to gallop from the spot; for not only did I feel terribly ashamed of my nervousness, but in imagination I heard Macneil's voice calling, 'Move not one step back or forth!'

Black Knight had so far stood like a statue, either unaffected by that devilish whispering, or more likely—trained to instant and implicit obedience, as he was—responsive to the low-voiced order I had given him to stand still. But now he shook his head and snorted, a violent trembling affected him, and his hoofs stirred restlessly. Again Macneil's warning came to mind. If the horse moved, if he turned, what might not happen? I did not know; but, in a voice which faltered, I repeated the command, 'Stand still!' and the good horse—I could almost feel the effort he made—obeyed.

But what had so suddenly shaken him out of his calm? Ah, the shadow! I had forgotten it. I bit my lip hard to keep back a cry. For I saw not one, but two, three, a dozen shadows dancing, flickering to me, away from me, in and out, weaving fantastic patterns which seemed to my excited brain an army of imps leaping to destroy me. So swiftly did those circling shadows move, the moonlit ground was dark with them, just as the air was loud with fell whispers of death.

These horrible things lasted probably a minute in actual time; but to Black Knight, shivering under me, and to me, sitting with throbbing heart, sweat-drenched face, and nerves thrumming like jarred harp-strings, weary, torturing hours seemed to pass. I don't think a human brain could have endured the trial long without giving way. I believed myself slipping from the land of reality into the region of those incessantly dancing shadows, and I don't know what I might not have done in the mental confusion into which I had been flung.

But that wild laughter rang out again, holding now a fearful menace, and through the clatter of sound I heard Tom Foster's voice—no imagination this time—'Slide off! Don't move! Black Knight down!'

I had sense enough left to understand, and, sliding to the ground, muttered a word to Black Knight. That good horse instantly obeyed and lay down, while I, in response to another shout, lay beside him, snuggling under his broad flanks with a delightful sensation of relief, though those whispers still hissed above us, and the shadows jumped as if the imps were frantic to penetrate the charmed circle some magician had drawn around me.

Suddenly the circle of hissing was broken, so to speak, by half-a-dozen sharp cracks, as of smooth stones clashed together. I saw a certain confusion among the shadows, and some thing or things fell clattering to the ground.

Surprised at this novel development, I sprang erect. Foster and Macneil shouted with one voice, 'Lie down!' Something struck me violently on the side of the head, and—I lay down.

A bullet hummed past me as I fell; another revolver roared somewhere; then darkness—silence.

I opened my eyes to find Tom Foster bathing my temples and moistening my lips with brandy, while Macneil was staring into my face with a very anxious expression upon his own.

My head must be pretty thick, considering the number of times it has been whacked without much bad result, and it wasn't long before I got upon my feet. The first thing I saw was some one face down upon the ground, arms outstretched, and very still. Foster said quietly, 'It was him or you. He fired as you fell.' And Sandy supplemented, 'An' then he ran roond to get Black Knight out o' the line o' fire, an' took anither shot at ye as we galloped up.'

'The whispers?' I asked weakly. 'The shadows? What'——

Sandy gripped my arm and led me aside. 'Look!' he said; 'whispers and shadows both.'

The ground was littered with curious objects which I recognised at a glance. 'Boomerangs!' I gasped.

'Jist that—boomerangs,' said Sandy. 'Anither ten seconds in the saddle, an' yer heid would ha'e been smashed by one or mair o' they deevilish things. Ye were safe behind the Knight, for the thrower aimed high, never reckonin' ye'd dismount. Ye'd ha'e been a' richt if ye hadna jumped up. One o' the last o' them hit ye, but providentially missed yer temple.'

'Some of the hurtling sticks met in mid-air with cracks which startled me to my feet,' I explained. 'Well, by George, what a tricky trap! I must compliment you upon your smartness, Sandy. I understand now why you warned me to stand still. My word! Bobby was an expert thrower, and no mistake!'

'He meant to have yer life, too, one way or anither. Man, I wisht I had my mither's gift o' second-sicht! Still, the nicht I warned ye her mantle must ha'e pairtly enveloped me; for I saw ower yer heid a boomerang as plain as plain, an'——

'Sergeant! Sandy! Here, quick!' Foster called, and we hurried to the spot where he stood beside the dead man, whom he had turned upon his back. Without a word, he pointed downwards.

A loud exclamation escaped Macneil. I stared stupidly. The corpse was that of a blackfellow!

We were silent for a moment. Then Foster said, 'We did not examine him after he fell, being so taken up with you. Who would have thought of this?'

'Not one of you three fools, anyway,' came an immediate answer in a loud, deep voice, and we jumped apart as if a bullet had sung through our midst. 'You have escaped me this time, Sparks; but look out for yourself when next you meet Bob Pollet.'

Foster sprang forward, but I restrained him. 'We should never find him in the scrub, Tom; but we'll get him some day. The crafty ruffian! Now I understand things. I wondered how any white man could be so clever at boomerang-throwing. I see! I see! Tom, I beg your pardon.'

'Why?' asked Tom, astonished.

'For speaking as I did about this blackfellow. Pollet most likely went north and brought the poor fellow back with him to do his murderous work. It is more than probable that the aboriginal knew no English. There was no ventriloquism either. The blackie supplied the shrill laughter in my rear that night by the creek, while Pollet stood quietly in front of me.'

Foster nodded and stooped to pick up one of the boomerangs. 'Our friends across the sea, or even the town-bred Australians,' he remarked, 'would marvel could they see what wonderful things a clever thrower like poor blackie here can do with his boomerang.'

'Ay wad they,' agreed Sandy. 'I understand the principle; but I've no' been oot here lang enough to ha'e seen them in operation.'

'You're not likely to about here,' said Foster. 'You see, if thrown to kill, the boomerang drops after striking the object at which it has been aimed. Otherwise, it circles and circles until its flight ceases at the spot whence it was cast. Had only one boomerang struck the sergeant fairly he would have been killed. To keep half-a-dozen flying around him at one time was to make certain of presently pounding his head to a pulp. Certainly only an aboriginal could have performed such a feat.'

'Yes,' I put in; 'and the boomerang which struck me must have been almost spent. The dark, slender outlines of the weapon would be invisible in the moonlight unless very close to one, but the shadow on the ground would be clearly seen near by. Well, well! I'm sorry for the ignorant black, who was but a tool of the rascal Pollet. But, my word, boys, that fellow is clever! No wonder Flower found him useful.'

'We've got to find a use for him at the end of a rope,' Foster said violently.

'Ay!' agreed Sandy; 'an' as sune as may be.'

. . . . . .

Sergeant Sparks was renowned throughout Australia for his courage. I remember thinking, when I heard him tell this story, that for the sake of dramatic effect he made himself out to have been rather more scared than he really was.

(To be continued.)

A MOSQUITO-PROOF TENT IN NEW ZEALAND.

IN your issue of June 1910 there is an article on the danger and trouble caused by mosquitoes in tropical and subtropical regions.

It may be worth while to mention an experience in New Zealand. The present writer was sent by the late Sir Donald M'Lean, Chief Native Land Purchase Commissioner, to survey the boundaries of a large block of land then (1859) being negotiated for with the Maori owners in the North Island. Mr M'Lean, as he then was, was held in much esteem by the Maoris of New Zealand, so that they used to say, 'First Wikitoria [the Queen], then Makarini [M'Lean].' He came from the island of Tiree, Scotland.

This block of land, two hundred and fifty thousand acres in area, was then in its natural state save for the limited native clearings and cultivations along the banks of the three large rivers intersecting it. The 'forest primeval' still stood over most of it.

In the summer-time the mosquitoes were a terrible pest, and smoky fires at each end of our tents were kept up at night. Even in the daytime in the bush we had to wear calico gloves with holes for finger-ends, and a green gauze veil put over our caps and tucked in at the breast and back, and sew up the openings of the shirt-fronts and sleeves; green being the best colour to see through comfortably while using the instruments or for the men cutting lines. We were glad to retreat at lunch-time to the river-margins and clearings for a short spell from the mosquitoes.

At last we hit upon a mosquito-proof tent which gave perfect comfort at nights and on wet days. It had a calico floor sewn closely all round to the sides and ends. The open end was abolished, and entrance given by a manhole with a calico pipe or tube sewn round it and extending some three feet in length. On our entering or leaving the tent through this tube the end was tied up.

Ventilation was given by openings in each end of the tent near the ridge, covered with netting of sufficiently large mesh to admit air, but small enough to exclude mosquitoes. The calico floor excluded all insects.

In pitching the tent a layer of brushwood for bedding was first placed on the ground, and the tent-floor laid over this. On entering we gathered up the tube in the hand and put one leg through, the rest easily following. This proved a great success, and we could listen with pleasure to the mosquitoes humming outside.

The tent described would be useful to travellers and explorers in many lands. The mosquitoes here did not seem to have any injurious effect save the worry they caused, and in some persons the swelling of the parts bitten; no malarial effect followed.

This block of land is now nearly all cleared and occupied as farms, forming several townships, and the mosquito-pest has generally nearly gone owing to the drainage of swampy land and the substitution of English grasses for the native bush and growths. Railways and roads run through the block; and in one old native clearing of some five hundred acres, where at the camp in 1859 we had to keep walking about with our pannikins of tea in our hands at the evening meal, as sitting down was a torment of mosquitoes, there is now a town of eight thousand persons, and one hears little talk of mosquitoes there.

In 1859 there were many settlements of Maoris along the river-banks, and several old stockaded *pas* with carved posts and figures. These have now quite disappeared; and there are also fewer Maoris, who are not so healthy or so happy as they were fifty years ago. In 1859 the Maoris supplied several European traders living at the mouth of the principal river with produce brought down in their canoes: dressed flax, wheat, potatoes, pigs, &c. This trade kept two coasting-vessels employed. This is now wholly a matter of the past. Certainly the advance of settlement has not improved the condition of the aboriginal Maoris. They are a fine race, and the writer lived among them for two years on this survey with perfect safety and confidence on both sides.

TOM THE FIDDLER.

By Sir A. Scott Reid, K.C.B.

THE purpose of the following lines is to rescue from oblivion the name of a still surviving and favourable specimen of a class which, under various chilling influences or causes, is gradually disappearing from the Highlands of Scotland.

Tom was—I prefer to speak of him in the past tense, and as I remember him in his palmy days—one of Nature's musicians, the sum of his artificial instruction having been conveyed in one lesson received in his youth, and for which he had paid a guinea, an event he was in the habit of alluding to with apparent pride and satisfaction. United to a natural taste and love of music, he possessed a keen sense of wit and humour, which enabled him to fill up the intervals, while in the exercise of his professional

function, with an inexhaustible fund of anecdote, sometimes more pointed than refined. To these were added a ready tact and appreciation of the fitness of things, generally displayed in covert, but none the less effective, acts. Were a tune asked for by a Mackenzie (his own patronymic), more especially if of some social importance, the lilting strains of 'Caberfeidh' replied; and I imagine that as his bow swept across the strings visions of the past glory of the great Applecross, his former friend and patron, and still the constant subject of his thoughts and conversation, rose before Tom's mind. His music was what in poetry would be termed lyrical, and was confined to the simple melodies of his native land. These he played with a rare sweetness and spirit, and with considerable variations; in fact, to such an extent was the latter feature developed that he was sometimes credited with original composition, and I never heard him deny the soft impeachment. Other forms he designated as 'foreign waltz,' and regarded with disfavour.

To see Tom in his proper element was to meet him at a country wedding, where he reigned the presiding genius, second only in public interest to the principal actors in the scene. There, indeed, like his famous namesake,

> Tam was glorious,
> O'er a' the ills o' life victorious.

Sitting in a conspicuous position, with left foot extended and eyes closed, he threw his whole body as well as his soul into the spirit of the theme. Each muscle and limb vibrated to the measure of the music, and dead to feeling must have been the wretch who could sit unmoved.

> The step grew light, and the bent form erect,
> When Tom drew his bow.

He was not a teetotaler, neither was he given to liquor. He objected to extreme views, being in favour of honest drink temperately taken. To him the moderate use of the bottle was accompanied with no sense of degradation. On the contrary, I think his ideas on the subject might have been summed up in the reply of the old parishioner to his spiritual adviser, who was representing that there would be no drink in a future and happier state of existence: 'Weel, sir, I think it would be a respectable thing to see it on the table.'

Tom rarely left his own parish, in which he had no rival; but on one occasion of great importance he was called in his professional capacity to the neighbouring island of Skye. There he encountered a competitor. There cannot be two kings in Brentford; neither could there be two fiddlers at Duntulm. After eying his rival with much the same expression as that with which one strange collie approaches another, 'Can you play?' said Tom. 'Oh yes,' was the reply; 'I was teached by Macfadden.' 'Teached by Macfadden, wass you? Let me hear you play "Caberfeidh."' The request was complied with, but the result was unfortunate. Swift as Nemesis, and accompanied by an intense accent of pitying contempt, came the verdict, 'Poor old man, I am afraid that you're a liar, for I was teached by Macfadden, and he never played "Caberfeidh" on that key!' Whether the poor old unveracious man survived the blow I never heard. Perhaps his spirit may still be heard among the old castle ruins trying to retrieve the reputation of its former owner. Neither was I told, though I have often wondered, whether the great Macfadden was really identical with the master from whom Tom had received his first and only lesson. To have asked might have spoilt the story.

A few more words and I am done. A short time ago, returning on furlough to the scenes of my youth after years spent under a tropical sun, I found many changes, and some to sadden. The merry dances which used to celebrate the union of bonny lassies with their admiring swains had given place to a cold collation and a brief announcement in the domestic columns of the *Inverness Courier*—an innovation, perhaps, more beneficial to the pocket of the bridegroom than agreeable to the feelings of his guests. Social meetings had taken the form of discussions on the Land Laws, and long and dreary sermons were the pabulum on which the rustic mind was fed. I sent for my old friend Tom. Time had laid his heavy hand upon him; but I think what told more upon his sensitive organisation was the desuetude into which his art had fallen. To me

> He sang wi' joy the former day,
> He weeping wailed his later times.

I asked him to play a few of the airs which had captivated my youthful fancy. Alas! could the strains I heard be the same, or had my senses been corrupted by the compositions of Strauss and Offenbach, as executed by the regimental band? The glamour was gone, and another dream departed from my life.

HER IMMORTALITY.

When I remember how fair blossoms fade,
Breaking frail hearts for winter's chilly kiss,
Yet year by year renew their pristine shade
When spring returns and whispers of fresh bliss,
I marvel that men say thy beauty must
Like baser bodies wither to the grave,
That hands and lips and eyes will turn to dust.
Can God retake what once He gladly gave?

Thy beauty may not suffer time's eclipse,
Thou art indeed immortal; age possesses
Title nor claim upon thy passionate lips,
Nor can resolve to white those golden tresses.
His mysteries to thee Death may not teach,
Nor can wrap silence round thy silver speech.

Chambers's Journal
SEVENTH SERIES

THE ROTTEN MADE SOUND.

By Professor HUGH WALKER, LL.D., Lampeter College.

IN the February number of *Chambers's Journal* I had the privilege of unburdening my soul in respect of the social problem, in an article entitled 'Something Rotten in the State of Denmark.' The article may be described as a plea that the spirit of science, and not that of party, should be brought to the study of the problem. It offered no solution of the difficulties, and it closed with the expression of a vague and dim hope that sometime, somehow, the spirit of science might afford us aid in our distress. It might be described as the voice of one groping in the dark. But since then I seem to myself to have seen a great light, not from within, but from without; and my purpose now is to draw the attention of readers of the *Journal* to this light, and to ask them to judge whether it is real or a mere will-o'-the-wisp.

Shortly after the publication of the article above mentioned I received a letter from a person whose attention had been drawn to it. He enclosed a pamphlet and referred to a book, and I read both. The latter was little known, although it had been published in French as well as in English, and had been warmly praised by some of the foremost economists in Europe. But it suggested an idea which seemed at once to throw such light upon the whole social problem as to make the book to me the most original, the most fascinating, and the most hope-inspiring of all the works upon the subject that I had ever read.

Any one who still doubts the extreme gravity of the dangers which beset the modern organisation of society should read Herr Hildebrand's remarkable book, *Die Erschütterung der Industrieherrschaft und des Industriesozialismus*. The causes which have produced the organisation are there examined. Herr Hildebrand shows how the insane dream of Britain that she might remain the workshop of the world—a dream which, had it been fulfilled, would have found us now with hardly a bush to shelter a singing-thrush or a green field from which a lark might soar to heaven—was shattered by the peoples of other lands. Unwilling to be ploughmen and stock-raisers to Britain, they proceeded to organise themselves industrially, perhaps only to meet a worse fate than that from which they sought deliverance. The process has spread and is spreading. Europe and the United States are already largely industrial. The whole East—including Japan, India, and the newly awakened giant China—is moving in the same direction. So are the British colonies—Canada, Australia, and South Africa. So are the principal states of South America. In a word, unless something be done to check it, the process is clearly destined to spread over the whole world. And what then? Then we have to face the fact that neither men nor nations can 'live by taking in one another's washing.' The fatal weakness of industrialism, as we know it, is that it upsets the economic balance in such a way that that which ought to be secondary, because nature made it so, becomes dominant, and that which ought to be dominant, also because nature made it so, becomes subject. It is beyond dispute that agriculture is the primary industry of humanity, while manufactures are derivative. Unquestionably the tilling of the soil must, in the last resort, both supply the materials and afford the market for industry. Now, in Britain the last has become first, and the first last. In Germany the balance is gravely threatened, if indeed it be not already overturned. France is partly saved by a stationary population and a system of land-laws which binds a large proportion of it to the soil. Even the lands of America are not boundless; and inevitably, if the process goes on unchecked, the same overturn will, sooner or later, be witnessed there. But America has still to be filled up, while the East is already full. Who shall say what may happen when the terrific human forces still pent up there burst the bonds that have hitherto fettered them, and begin their march along the path by which the West has led? Herr Hildebrand tells us. It is, he says, since about 1825 that commercial crises have become periodical, and the cause of them is the industrial system. Universalise that system, and the result must be a crisis compared with which the worst in the past is as nothing. For there will be no escape. Hitherto, sooner or later, though not without much suffering, the cure has been effected by bringing in the agricultural peoples to redress the balance of industry. Gradually demand has overtaken production, and the wheels have begun to move again. But when

 [*All Rights Reserved.*]

there are no agricultural peoples left? Then there is no escape. Life must pay the price of a fatal mistake. The social Armageddon has come; and in blood, or more miserably still by the slow death of sunken cheeks and fleshless ribs, the false order must make way for the true.

We hardly need a profound economist to tell us this. Though he can put it more impressively than we could, the ominous unrest around us is sufficient proof that there is something seriously amiss with our system. It is useless to carp and cavil, or to lay the blame on this side or on that. The probability is that, as the phrase goes, there are faults on both sides; but by parity of reasoning it is also probable that there are elements of right on both sides. Now and then it may be possible to say that this side is wrong or the other; but the continual recurrence of disputes affords a strong presumption that both sides are in the grip of circumstance. Many probably have felt thus; and perhaps many, too, have been brought to the verge of despair by the conviction that the remedies suggested are either childishly inadequate, or start with some gross injustice and end in a Utopia where no man with the blood of freedom in his veins would consent to live. Such, at least, was the state of my mind until that astonishing awakening to which I have already referred.

Two points in particular in the pamphlet, *Careers and Work for All*, startled me from my pessimistic lethargy. One, which is rather appended to the pamphlet than part of it, was a simple diagram illustrating the difference, as in 1812 and 1912, between the *power* of production on the one hand and the *actual* production on the other. It is estimated by one of the most cautious as well as eminent of living economists that the *power* of production has, by machinery and improved methods, been multiplied by from four to six; that is to say, each unit of labour could now, working in an efficient industrial organisation, produce on an average from four to six times as much as a unit could produce in 1812. Where, then, it will naturally be asked, has the increased production gone? Many social reformers, in their dismay at the terrible condition of our slums, are tempted to reply, 'It has gone into the pockets of the rich.' Captain Petavel —for this retired officer of the Royal Engineers is the author of the pamphlet and of the book— says no; a small part has gone to enrich the rich, a somewhat larger part is distributed among the workers, *but by far the largest part of the increased power of production is not used at all.* This, he insists, is the simple but momentous fact which has revolutionised the social problem. More and more, in their despair, the poor have been driven towards projects which are really predatory, however much the guilt may be palliated by their sufferings. More and more social reformers who are not themselves poor have, by sympathy with the sufferings, been induced to support such projects. So real are the sufferings and so widespread is this spirit that unless some great change takes place, and that soon, probably the experiment of State Socialism will be tried. But, says Captain Petavel, this spirit is altogether antiquated; it sprang up and had a meaning in a state of things that is past. Once we realise the fact that the whole body of existing wealth is small compared with the potential wealth of the community we cease to hanker after the possessions of the rich, and instead raise the questions, 'Why are the powers of production not fully used?' and 'How can they be brought into action?'

The answer to the first question is, the powers of production are not used because demand lags fatally behind. And so we have the topsy-turvy phenomenon of *over-production*—that is to say, *too much* wealth in a community which is simply hungering and thirsting for *more* wealth. And yet, notwithstanding the paradox, every business man knows that there is a reality behind that phrase over-production. His stores are full, but nobody will buy; he cannot meet his engagements, and is ruined. The warehouses of Lancashire hold millions and millions of yards of cotton, and there and elsewhere are millions of backs ragged and shivering. Yet, somehow, we cannot get the cotton to the ragged back, and both manufacturer and would-be customer suffer.

Apparently, then, the powers of production are already apt to be too much used; and to use them more would only be to get into deeper difficulties. It is over-production the manufacturer fears, and he will hardly thank us for suggesting more production still. But Captain Petavel has his answer. *Increase the demand*, he says, and not only the existing powers of production, but the latent powers as well, will soon be in full use. But how increase the demand? By employing the unemployed, by providing 'careers and work for all.' Give them money to spend, says he, and you may rely upon it demand will increase just in the same proportion. The miser is a rare phenomenon; most men would use wealth if they had it.

One can easily imagine the sad smile which comes upon the reader's face at this point, as it came upon mine. But Captain Petavel is no mere visionary philanthropist who trusts that luck will somehow provide bread for the mouths to eat, or that Providence will intervene otherwise than through human agency. He has his solution of this difficulty too. And this brings us to the second of the two points which have been mentioned as specially striking in the pamphlet. It is that under modern conditions *almost any labour*, skilfully organised, can be made self-supporting. This is not a matter of

speculation, but an ascertained fact. The history of the Swiss labour-colony of Witzwyl is almost incredible, but it is vouched for by a committee of the Royal Commission on the Poor Laws which visited it. Witzwyl is an establishment for convicts, containing apparently an average of about one hundred and sixty prisoners. They are of various classes; but the largest class is that of persons sentenced to workhouse detention as being vagrants or 'work-shy'—surely the worst of all classes for production. And yet the astonishing fact is that this colony pays its own expenses. 'The balance-sheet for 1907,' say the British commissioners, 'shows a profit, including the value of improvements, taken on a valuation made by commercial valuers.' The colony is on an estate originally of about two thousand acres. In 1895 it was, except about one hundred and fifty acres, 'in a very poor state indeed; the soil was exhausted; the buildings were in ruins. To-day this estate is in fine condition; the buildings on it, which have been largely added to, are in an excellent state of repair; and the area of the farm has been increased, so that it extends now to two thousand four hundred and seventy-one acres.' And all this apparently at little, if any, cost to the community! Surely we must admit that even exceptionally poor labour, if well organised, can maintain itself. We have to take note of the peculiarity that the labour is forced; that is to say, the workers are men under sentence, not free to go away when they please. But few would regard this as an advantage; and at any rate there are no warders, police, or soldiers, yet very few attempt to escape. The commissioners attribute the remarkable success of the colony to two causes: first, the large number of gangers (about 25 per cent. of the total hands), free and paid workers, whose example and teaching are essential to the efficiency of the whole; and, secondly, the personal influence of the governor and his wife.

We seem, then, to have two conclusions buttressed by evidence which deserves careful consideration: (1) that there is an immense reserve of unused productive power; and (2) that, under skilful management, even labour exceptionally inefficient can be made self-supporting. If so, there ought to be a handsome balance for the fairly efficient, and a very large one for the skilful. Captain Petavel proceeds to show this, and to develop the consequences, in his fascinating book, *The Coming Triumph of Christian Civilisation.* (George Allen & Co.). To unfold the programme would probably be to excite in other minds the utter incredulity which it at first roused in mine. It is rather to be hoped that what has been already said may induce readers to turn to the book itself, when perhaps scepticism may become less sceptical. It must suffice here to touch upon only a few of the boons this attractive scheme promises. In the first place, it brings the people 'back to the land.' Many of us have felt that nothing could succeed which did not do that, and Herr Hildebrand's theory shows that we were right, and why. Secondly, it promises the abolition of slums, and the substitution for them of garden cities, and this in a way which will enable compensation to be paid for the properties demolished, and leave a handsome profit. Besides, there is force in the argument that, even if it were not so, we have to face the fact that we have become a nation of town-dwellers, that our present towns and town-life are unhealthy, and that we *must* change them at whatever cost, or face ruin. Wealth may accumulate, but if men continue to decay nothing but ruin can result. Of the volunteers offered by Manchester during the Boer war, only about one-fourth attained even the lowered physical standard of that time of stress, while far less than one-fourth reached the normal standard of the army. A third point in Captain Petavel's system is that it binds industry and agriculture, the land and the workshop, closely together. That, he maintains, is the only economically sound system; and, at least for such a community as we are, he seems to be right. That, again, is the reason why he makes out a profit from the operation. The decentralisation of population increases enormously the acreage of 'accommodation land,' and only in this way, probably, is the revival of British agriculture possible. The reason of this increase in the area of 'accommodation land' is that land becomes 'accommodation land' because of direct access to a market. Now, directness of access depends upon absolute distance, not upon the size of the market. An urban population of ten millions distributed in one thousand towns of ten thousand inhabitants would have incomparably more 'accommodation land' than the same population distributed in ten great cities of one million each. The little town very largely draws its supplies from the neighbourhood; the great city is far more apt to be a customer of the foreigner. The high rents of 'accommodation land' prove the greatness of the advantage of direct access; and even at the high rents there is no difficulty in letting such land; it is 'rural land' that has suffered from foreign competition. Increase the acreage of 'accommodation land,' therefore, and you increase agricultural well-being.

Only one point more can be mentioned. Decentralisation, it will probably be felt, is a mere dream. Men gravitate to the centre as surely as apples fall towards the earth. They certainly do so *now;* and for a full answer to the question why they need not do so *always*, readers must be referred to Captain Petavel's book. The single point there is space to notice is, the extraordinary cheapness, under favourable conditions, of railway travelling. Our own Great Eastern Railway carries workmen ten miles for a penny; the Belgian State railways carry them

twenty-four miles for the same sum. In the former case it *pays* a commercial company, bent on making profits, to do it; in the latter case we may assume that Belgium is satisfied that it pays indirectly at least, if not directly. Cost of transport, then, may be almost negligible; and this is a fact that awakens a multitude of thoughts. Many details illustrating the possibilities of cheap means of transit will be found in the interesting article by Mr A. F. Whyte, M.P., which appeared in the February number of the *Journal*.

The question may be asked, 'Is this system socialistic or is it individualistic?' The answer is, it is both. There certainly must be some socialistically organised labour. But it is voluntary Socialism, and it is not universal Socialism. Captain Petavel asserts that by establishing a limited Socialism we should re-establish individualism; and this seems to be true. Year by year individualism is more and more interfered with, and before long there will be little of it left. And surely this mixed system is psychologically right, and is the only system that is so. It is true, as Aristotle asserted long ago, that man is a social being. He cannot realise himself except in society; there is an 'unearned increment' of the intellect and the soul as well as of the land. And yet, on the other hand, there is a sense in which the soul of man stands, and must stand, unalterably and eternally alone. There is an 'unplumb'd, salt, estranging sea' between each man and his nearest and dearest friend. And the most sacred right of all is the right to have this incommunicable personality respected. In a populous community we must expect to find the widest varieties; on the one hand, many who cannot live except with the help of others; on the other, some who neither need the organised aid of others (though they *do* need their society) nor can give their best under it. The latter class may be numerically small, but it is of incalculable importance. It includes nearly all the original men, and the original men have in all ages been the springs of progress. One of the weak spots in systematic Socialism is that it seems to offer no secure place for the original man. Yet we can dispense with a million men of routine with far less risk of loss than with one originator.

It is easy to say that it is all a dream, that it flies in the face of human nature. Well, in its grand proportions it certainly *is* a dream now (though Captain Petavel is actually engaged in thoroughly practical work), and a dream it will remain unless men unite and labour for it. But its peculiar strength seems to be that, as has been pointed out above, it does justice to both sides of human nature. If Captain Petavel's state be a Utopia, it is of all the Utopias the least utopian, and in consequence is the only one the present writer ever desired to live in. No doubt there is a sense in which it may prove to be 'against human nature.' *We* are 'human nature;' and if the forty-five million inhabitants of these islands all with one consent determine to do nothing, then it is against *our* human nature. But what if one in every thousand determined otherwise? A little leaven will leaven a whole lump, and possibly the nine hundred and ninety-nine might find themselves dragged in the train of one. And then 'human nature' comes to be that which the one initiates and the nine hundred and ninety-nine do. A beginning has already been made. In the Educational Colonies and Self-Supporting Schools Association, centred at Stanford-le-Hope, Essex, an organisation already exists which offers to any convert to the scheme the opportunity of taking a practical part in the task of furthering its ends.

THE CAHUSAC MYSTERY.

CHAPTER XXIII.—AT THE HÔTEL MARAVIGLIA.

THE Hôtel Maraviglia made no outward show of its wonders. It was situated in a narrow street, and turned a peculiarly gloomy frontage to the world. Yet it is only fair to mention that its customers found it much more comfortable than other hostelries of far more promising aspect. It was owned and conducted by a pallid and very bald Italian, who was well and favourably known in the neighbourhood as Monsieur Zalpini, 'monsieur' representing to the mind of the man in the street the prefix appropriate to the name of every foreigner, whatever his nationality. For twenty years Monsieur Zalpini had run his hotel with the strict economy of an Italian who is amassing a fortune wherewith to return to his country at the earliest possible moment, yet the economy was modified by the eminent good sense with which he recognised the fact that to attract and to retain well-paying clients one must be a little liberal here and there. This point he was in the habit of illustrating by rubbing the tops of his fat, dark fingers together as if sprinkling salt on some desirable *plat*. 'Let the mule feed, that he may live long and carry the more,' he would say; 'it is, in truth, an old adage, but of an admirable sagacity.'

The management of the Hôtel Maraviglia gave Puyfot entire satisfaction. There was no stint of flavour in the food, and the absinthe had the aroma of good quality; moreover, there were among the guests persons with whom a man of brains could converse and meet with appreciation. Also, it was summer, and even England is sometimes not so accursed in summer! This period

of happiness was, indeed, the full noon of his life; but to Puyfot it seemed only the dawning of a yet more brilliant day.

On the evening following Malcolm's last conversation with Lady Madesson, a tall, slouching individual, with a shabby handbag, turned in at the low door beside which Zalpini sat in a gloomy box which he called the bureau. An acquaintance who was crowding up the door of the bureau stood aside while business was done.

'A room! But yes, one or two to spare. Monsieur desires a small room of trifling expense?' Zalpini shrugged his stout shoulders. 'I fear no! Ah, monsieur is ready to pay an advance! *Buono!* There may be an apartment on the third floor, who knows?' Zalpini, softened by the sight of gold in his new client's dirty but delicate hand, hissed sharply through his teeth.

This brought forth from the cavernous passage a waiter of a cheaper racial quality than Italian. He spoke no known language, but a polyglot picked up during the months he had served the nationally differing guests who formed the clientele of the Hôtel Maraviglia. This youth was understood to say there was a room available, and the slouching stranger inscribed his name in a thumbed volume that lay open before Zalpini.

'Alphonse, show monsieur his apartment.'

The waiter shuffled off, followed by the tired figure of the man who had written down his name as Ambrose Finch. The two Italians left in the bureau stared after him. His sandy hair and thick sandy beard were ill-cut and untidy, and a general look of defeat and depression hung about him. As he disappeared Zalpini reseated himself.

'English!' he said with his finger on the written name; 'but yes! Ambrose Finch! None but barbarians could conceive of such a name, and no civilised personage could pronounce it! He is what they call "down on his luck," *hein!*' with a grin.

The two laughed together with the self-gratulation of the well-to-do.

'He said that he had been recommended to come here. I do not suppose he has often been in such a house,' pursued Zalpini. 'See you, Bagio, how excellent it is to have a good name? It is no more than to-day a halfpenny, to-morrow a farthing, and behold the third day you gather in a shilling!'

'That may be so in your trade,' replied Bagio dubiously; 'but I am a seller of boots.'

Meantime the subject of their remarks was treading the grimy stairs not at all in the spirit of satisfaction which Zalpini imagined; the stuffy odours of escaping gas, cooking, and much-breathed air suffocated him. Would any good come of it after all? He looked round with distaste upon the bed and furniture as the door closed upon Alphonse; he felt the positive nausea of a fastidious man who is forced into contact with such surroundings. The next instant he was blaming himself that he should grumble at anything—anything—when he knew all that Lorrie had gone through for his—sake. Sake! No, for his aid. *She* had brought Puyfot to England; she had even asked him to her house and given him the help of her influence and her wealth. She had endured his society and even listened to his confidences. He could never repay her for her splendid unselfishness; if he succeeded, his success would be owing to her wit and to her courage, not his own. Detching was right; she was a woman any man might adore. Yes! Yet his heart gave no echo to the words, and it was Alice's gentle face, with its eyes of April blue, that haunted him.

As the days passed Malcolm Cahusac settled down more or less to the rôle he had undertaken. At the outset he spoke little, merely giving out for Zalpini's benefit, and because he realised that a known fact kills much of the speculation and gossip which gather about any reticent stranger, that he was looking for a clerkship. He was seen to search papers and to answer advertisements in weary profusion. He applied to Zalpini for advice more than once, and that personage had been heard to remark that the Englishman was 'of a good sort' when all was said.

Cahusac became bolder as time went on; and now, feeling secure in his new personality, he even discussed political events with the habitués of the restaurant, which occupied one whole side of the ground-floor of the Maraviglia. Puyfot often took part in the talk, but he obviously held himself to be somewhat above his company. Yet, his tongue being a member that could not resist wagging, he gave his opinions with a good deal of volubility. But though Cahusac sometimes found the discussion veering near the topic in which he felt interest, not one word did Puyfot drop that proved of the slightest value.

At the close of a week Malcolm began to feel that it was time to report, not progress, but his lack of it; besides, the prospect of a talk with Detching in a less stuffy atmosphere, and the acquisition of a couple of clean shirts to go on with, was exhilarating.

He found his friend as red, sardonic, and as apparently unresponsive as ever, yet something intangible about the man warmed Malcolm's heart with a fresh conviction of his friendship.

'No, I have found out nothing.' Malcolm emphasised the last word, and then laughed. 'Yet, on my honour, after that bath you were good enough to propose I feel an entirely contented man.'

'Pretty near all that a man hath will he give for his physical comfort,' remarked Detching. 'So you have gathered no information from Puyfot or anybody else?'

'Not a word! You will have to make that humiliating confession to Lady Madesson. It

was very good of her to take the trouble to write those letters from Yorkshire for me, but I don't believe the hotel people have touched my bag. It has a patent lock, and I keep it always locked, and I'd be sure to notice if they had meddled with it,' said Cahusac.

And yet Zalpini had skilfully opened the bag, and had been through his letters days before! The Italian found it to his advantage to know as much about his guests as he could conveniently glean. He had slowly perused two notes on cheap paper, both dated from a remote village in Yorkshire. He judged they came from a shrewish sister of 'dear Ambrose,' who complained that no money had yet been sent her, that mother was very ailing, and she hoped Ambrose was not idling and enjoying himself in London, like other young men; and would he send a postal order by the next post? A second letter, a couple of days later, complained bitterly that he had not taken the trouble to reply to the first, and said that he must hurry up with the money, for she was sick of waiting, and she and mother had not tasted meat for a week. A postscript added she knew how careless he was with his money; and Zalpini, recalling the gold and coppers mixed in Finch's hand on the day of his arrival, shook his head and feared the unpleasant Caroline was not far wrong on this point. Besides these there was an angry little line or two from an acquaintance, asking for repayment of a sovereign lent two months ago, if it was a day! On the whole, Zalpini had concluded that Ambrose Finch was precisely what he represented himself to be, not in the least interesting, but—*sapristi!*—unlucky.

Unconscious of these facts, Cahusac went on, 'I sometimes wish, Detching, you could see me at the Hôtel Maraviglia! Zalpini and I are on intimate terms, I can tell you! I do errands for him—while I'm waiting for that miserable clerkship, you know!—but he says I have no notion of a bargain, so my usefulness is limited to fetching and carrying. By the way, that reminds me of something in your line that I came across a couple of days ago. You know the advertising fellow who has an institution at Parrot's Place for curing the world and his wife of every disease under the sun?'

'I have read of him, but I think he is hardly in my line,' retorted Detching with some dryness.

Malcolm laughed. It did his friend good to hear him, though he knew this more cheery spirit arose from nothing more lasting than the temporary escape from the Hôtel Maraviglia.

'At any rate he is so far genuine that he has cured one person. I took a broken potato-parer—I never knew how many extraordinarily clever dodges there are for simplifying kitchen-work until now—round to a French metal-worker for mending. That is the kind of job which, according to Zalpini, suits my ability. This old man, Jarné by name, told me that he had been for thirty years or so helpless with rheumatism, never left his house, and had to give up his regular trade and take to job-work such as I brought him. Well, two or three months ago he heard of Parrot's Place, and applied there, and the treatment appears to have agreed with him, for he is able to walk again fairly well. What do you say to that?'

Detching raised his eyebrows. 'What can I say when I have to judge from a jumbled account given by one ignorant person, and reported to me by another ignorant person?'

Cahusac threw back his head with a chuckle of boyish enjoyment at getting a rise out of Detching. 'I'll go round again—on your account, Detching—and ask for more accurate information. Besides, Jarné is a character.'

'I think it might lead to something more definitely useful to your aims if you were to go round and consult Lady Madesson.'

'What's the good of bothering her?'

'I never proposed that you should bother her.'

'Oh, well, I'm ashamed of failing to get any forarder with Puyfot,' said Cahusac. By the way, any letters for me?'

Detching stretched out an abnormally long arm and fished a bundle from a pigeon-hole in his writing-table, and threw it across. He watched Cahusac glance through the letters, and skilfully disguised an uncontrollable grimace when he saw a slight red come up into his companion's face over one that bore a delicate monogram, 'A. L.'

Cahusac did not even finish reading it, but put it back in its envelope, and, taking no notice of the remaining letters, thrust the lot into his pocket. His brief spell of good spirits was over, and it is a regrettable fact that Detching, noticing it, said a good many bad words in the privacy of his own mind.

Then Detching pulled out his watch. 'I'm bound to be at the club to meet a fellow just now; but I shall not be long, if you can wait for me for a bit,' he said, rising and stretching himself.

'Thanks; yes, that will suit me. I'm supposed to have gone down to Clapham to-day to see about a booking-clerk's place in a butcher's shop, so I have plenty of time,' Cahusac replied with an effort at his recent good spirits.

No sooner had Detching departed than Malcolm took out Alice's letter and read it through slowly and carefully. There was not much in it, only a pitiful reminder of their last meeting, of how stupidly she had let slip the chance of saying the very things she had meant to say; and she went on to beg him not to think harshly of her because of what Wil had told him—the poor girl could not bring herself to put the fact of her coming marriage with De Sarsan down in black-and-white for Malcolm's eyes to read; she did not look for happiness

in the future, but if she helped Wil, that would be something to live for. And she hoped that Malcolm would not be like her, but very, very happy—she had prayed that he might be so; and though, when they met again, they would each have other ties, still she would never alter, but remain as long as she lived his sincere and affectionate friend.

It was in truth a letter straight from a sorrowful, simple young heart, and calculated to wring the withers of any man to whom it should be addressed. Malcolm sat holding it in his hands, while his eyes ached and burned with the tears that never really come for a man's relief. Dear, gentle and confiding Alice! sacrificed to the differing but equally selfish aims of those two, Wil and De Sarsan, both of whom she believed truly loved her! For a long time the thought did not occur to him of the answer that he must write, and which she would be expecting by every post. When he recollected it a new perplexity confronted him. Suspecting De Sarsan as he did, was he not justified in sending her some vague warning? Could he forgive himself if he allowed her to take the fatal step of a marriage with such a man? He almost decided that he must write some hint, but in what words could he couch it?

Distracted by doubts of the wisdom of following this course, and the possible consequences of not taking it, in the end he snatched up a pen and wrote more tenderly than he was aware, telling her how grateful he was for her goodness in thinking of sending him a letter, and how entirely he understood all that she had done or meant to do, that he knew she lived for others and not for herself, but he begged her not to allow herself to be hurried into any decided act, and signed himself in the past, in the present, and always in the future, her faithful friend.

Perhaps if he had had time to read it again he might have altered its tenor, but Detching entered as he placed his name on the notepaper, and there was no opportunity for more.

(To be continued.)

THE ROMANCE OF COLLECTING WAR-MEDALS.

AMONG the many objects of the collector's search there are perhaps few to which more sentimental interest attaches than to war-medals. They commemorate the deeds of brave men who have passed away, and recall some of the innumerable heroic conflicts which won for us the Empire. It is a matter for regret that the collector, in his endeavour to rescue from destruction or oblivion these badges of valour, should have to contend with trickery and deceit. If the bestowal of war-medals is a tribute to the stout-heartedness with which some of Britain's sons can fight, the collection of them brings to light the skill with which others can deceive; and it may be of interest to discuss a few particulars of the faker's art—an art that is more extensive than some collectors may be apt to think. It will be convenient for this purpose to classify war-medals roughly into certain categories.

The first group that claims our attention embraces those medals issued prior to 1800, of which the dies are not now extant. There are two ways in which such medals can be reproduced—namely, by taking casts or by electrotyping. In the case of castings, the fraud can be discovered as a rule by examining the surface, and especially the smooth background, with a magnifying-glass of some power. If the medal has been cast it will be seen that this background is covered with minute pitting, a defect inseparable from the process, while if the medal has been struck the surface is absolutely smooth. Sometimes the faker tries to obliterate this difference by touching up the surface, or by subjecting the medal to artificial wear; but it is almost impossible to remove these marks entirely without wearing the surface unduly. As a final test, the aid of the chemist can be invoked to ascertain the specific gravity of the metal, for struck metal has a higher specific gravity than cast. Electrotyping scarcely need be considered. By the usual process the replica is made in two halves, which are stuck together; but it is very possible that, owing to improvements in the art, this method of imitation may become more dangerous in the future.

The next group to be considered includes those war-medals issued by the Hon. East India Company prior to 1845, of which the dies in one instance are in private hands and in others at the Calcutta Mint.

Restrikes of these medals are not uncommon, as it is only within recent years that the Calcutta Mint has been prohibited from issuing them. At first one might be inclined to say that to distinguish a restrike from an original would be a hopeless task, since both come from the same die; and indeed it must be confessed that to do so is not always easy. However, a die that has been laid aside for some time is sure to rust, especially in a tropical climate. The process of cleaning it injures the more delicate lines of the design. A doubtful specimen is therefore placed, as before, under the glass for the detection of any rust-spots and for the examination of the finer details. Further, the blank discs on which restrikes are struck are nearly always of a different thickness from those used originally, or have borders of a slightly different width. If an undoubtedly genuine specimen is at hand for

comparison, no restrike should escape detection. Occasionally proofs of some of these medals are met with. They are usually silver-gilt, and it is scarcely possible to remove all traces of the gilding without marking the surface of the medal.

The last group of war-medals to be considered is an important one, as it includes nearly all the war-medals bestowed by Queen Victoria, in most cases issued with a varying number of clasps commemorating different battles or sieges. All these medals (with but few exceptions) were issued with the recipients' names marked on them; and consequently in the examination of any such medal there are three things to consider—namely, (1) the medal; (2) the clasps, if any; (3) the recipient's name, and the engraving. As regards the medals themselves, all the dies are in the possession of the Government, and no restrikes are possible, except an occasional issue of a representative set to some semi-public institution; but there are in existence a certain number of silver proofs, and in some instances surplus unnamed medals which are a snare to the collector, for when one of these comes into the possession of the faker the skilful addition of a name on its edge may make it a dangerous lot in the saleroom.

It is, however, in the matter of clasps that the faker finds the most extensive field for his skill. Until comparatively recently a very large amount of the work of striking and fixing clasps to war-medals was not done by the Mint, but by outside firms to whom the necessary dies were supplied. Not only were surplus clasps struck at the time, but a very large number of the dies were never recalled by the Mint and are still in private hands. The result is that clasps can be had which were struck from the original dies a great many years ago; even if a clasp has been struck recently, it is usually a far more difficult matter to detect than in the case of a medal, for there is less detail to examine, it is coarser work, and there is no smooth background. The mere stringing together of a number of genuine clasps taken from two or three medals, and fixing them to one medal, is a comparatively unimportant form of fraud, as but little profit is to be obtained thereby; but the skilful substitution of a rare clasp for a common one may mean a gain of fifty to one hundred pounds.

Much can be learnt, also, from an examination of the name on the edge of the medal. It will be found to be machine-impressed or punched by hand in varying types, or else engraved in different ways. Each style has its own meaning, for the various campaigns and periods have each a distinctiveness of their own in these particulars, and in some cases this is true of individual regiments.

Fortunately for the collector, most of the earlier (and rarer) medals were impressed with a refinement which the faker cannot equal; and the various types of engraving also have as much character as handwriting. Still, very skilful imitations are to be met with. In appraising a medal of this group, therefore, the medal itself, the clasps and their riveting, and the name have to be examined; and in addition the medal-roll should, if possible, be referred to in order to see that the man's name is entered therein.

It will be useful now to give a few specific instances. At a sale in London not so very long ago a medal with two clasps (one being extremely rare) was offered for sale, accompanied by a photograph of the deceased veteran wearing his well-earned decoration, and a letter from a descendant authenticating it. It realised some fifty pounds. Among the records in a Government office there exists the receipt for his medal signed by the veteran in question, which shows that the medal when issued had one common clasp attached to it. Imagination can fill in, with some degree of accuracy, its history after it was purchased from the old man's heir. Its new owner removed the clasp and took the medal to the firm that has the original dies and surplus clasps, and representing himself as the grandson, stated with filial piety that he wished the treasured heirloom (now unfortunately damaged) to be 'repaired' by the addition of the two clasps which appeared later on in the saleroom. The total outlay must have been about three pounds, so the transaction was highly profitable.

Another medal with one very rare clasp was sold some little time back for about a hundred pounds. It had on the edge the name of a soldier who is mentioned in the *Historical Records* of the regiment as being present at the battle for which this clasp was given. The medal was authorised more than thirty years after the event, and was issued to survivors only. The *Historical Records* of the regiment show that this man was granted a sinecure appointment, which entailed his residence being within one hundred miles of Bombay. The India Office records reveal the fact that the only medals issued with this one clasp, and no others in conjunction with it, were sent to the Bengal Government at Calcutta, and not to the Bombay Government. A very strong inference exists that this medal is a proof, to which the name has been added, and that the clasp is spurious. As the recipient was a native soldier, a check by the medal-roll is not easy.

In the case of the Naval General Service medal granted in 1848 to the survivors of the wars from 1793 onwards, a vast amount of faking goes on. These medals bear only the recipients' names—for example, 'John Smith,' without the addition of any ship's name. Now, for the sake of argument, we may assume that among the very large number of men who received this medal with the one clasp 'Syria' there were a dozen John Smiths, and that among the very few survivors in 1848 of the action between the *Shannon* and the *Chesapeake* there was one John Smith who

received the medal with the clasp for that victory. The faker obtains the medal of one of the dozen John Smiths who received the 'Syria' clasp, which is removed; then (in the way mentioned above) he has his 'grandfather's' medal 'repaired' by the addition of the clasp '*Shannon with Chesapeake.*' In the sale-catalogue the magic word 'verified' is entered against this lot, signifying that the medal has been verified with the official medal-roll, and a large sum is obtained for it. The detection of a fraud of this sort may be well-nigh impossible, except by some lucky accident. Military medals, however, can hardly ever be manipulated in this particular way, as the man's regiment is added after his name.

Reference has been made to the medal-rolls, which consist of the lists of men entitled to the various medals and clasps, compiled by authority, and by which the issues were regulated. With a few well-known exceptions, medal-rolls of all Europeans dating from the battle of Waterloo are preserved in the different Government offices, and are for the most part very complete. The rolls for a few campaigns are entirely missing, but even in these cases a medal can be verified occasionally if the prize-roll or some other collateral document is extant. Almost all the medal-rolls of native soldiers are abroad, and the earlier ones are very incomplete; in consequence the verification of native soldiers' medals is usually difficult and often quite impossible, a fact which is reflected in their market values.

As the number of unnamed and surplus medals is small and annually diminishing, the edges of named medals are faked in large numbers. A genuine medal is fitted with the desired clasps, the recipient's name and regiment erased, and a suitable name and regiment substituted. Frauds of this sort are very common, though they can be detected at a glance, and it would seem to show that there are a large number of careless or inexperienced collectors. Our Government offices are not altogether strangers to this form of fraud, for now and again claims to pensions are received from unqualified individuals on the strength of faked medals bearing their names.

The faking of medals, however, is not restricted to the unscrupulous dealer; some medals owe their fraudulent character, without any doubt, to the personal vanity of the recipient. Private A. (or Lieutenant B.) is not always satisfied with the medal bestowed upon him by his sovereign, and sometimes adds to it such clasps as vanity or self-esteem may dictate; nay, occasionally he is not content with an extra clasp, but adds another medal. The assistants behind the counter in certain well-known London shops could tell some curious stories of this sort; and a considerable trade is done at Birmingham in the manufacture of colourable imitations of all clasps intended, not for the collector, but for the soldier.

Thackeray, in his burlesque entitled *The Next French Revolution*, depicts Louis Philippe reviewing his troops. His Majesty, going up to one old *grognard* and pulling him by the ear, says, 'Wilt thou have a cross or another ration of wine?' 'Sire,' replies the old hero, 'a brave man can gain a cross any day of battle, but it is hard for him sometimes to get a drink of wine.' The sentiment that inspired this fictitious French veteran of a past generation can be found now and again in the breast of the living British soldier. It is not an unknown occurrence for a soldier who is in possession of a rare clasp—say, for example, the China medal (1900), with the bar 'Defence of Legations'—to sell his decoration at its market value, which may be as much as ten pounds, and to replace it by one with a Birmingham clasp at the cost of a few shillings. In fact, even in the case of the commissioned ranks, the sale by the recipient of the most coveted decoration for bravery in the field has taken place *sub rosa* before now. The unwary collector, however, who favours this sordid practice is deceived sometimes (and deservedly so) by the 'old soldier' whose apparent reluctance to sell the medals on his breast is overcome at length by the power of the purse. Too late he finds that he has purchased a worthless faked-up group.

In looking at any collection of medals one cannot help noticing how inferior modern medals often are when compared with the earlier ones. If we examine a medal of Wyon's, for instance, we feel that we are looking at the design of a genius and the work of a master-hand; even in the smallest detail no sign of carelessness or haste can be detected; everything has been completed with the utmost refinement and skill. The clasps harmonise with the medal, and the rivets are the work of the jeweller. The recipient's name has been impressed on the edge with a skill that has never been equalled, or if engraved it has been done like copperplate. On the other hand, the modern medal is too often inferior both in design and in execution. The relief is poor and the metal soft; the clasps are heavy things, clumsily riveted together; the names are punched roughly or carelessly engraved.

After all, there is perhaps a certain fitness in this, for of late years the tendency has been to grant medals and clasps for comparatively insignificant operations and actions. A few instances will suffice to illustrate this. The Military General Service medal granted in 1847 to survivors of the wars extending from 1801–14 commemorated with its clasps twenty-eight battles, sieges, &c. The South African war, which lasted two and a half years, produced two medals and twenty-seven clasps. The Indian Mutiny, which lasted half that time, is represented by one medal and five clasps; the medal without a clasp being issued only to those who had been actually under fire. Many thousands of South African war-medals were issued to men

who were engaged in peaceful military duties, including the garrisoning of St Helena.

The great Duke possessed four British war-medals; the first Lord Hardinge also had four; whilst Sir Charles Napier, who fought in Europe, Asia, and America, had three.

This slight digression must bring our subject to a close. Medal-collecting, when properly undertaken, is not a mere hobby; it teaches the military history of our nation for more than a century; and this brief sketch, which gives a glimpse of the technical aspect of the subject, may serve to show how great is the interest attaching to it.

SOME ADVENTURES OF SERGEANT SPARKS, OF THE MOUNTED POLICE.

II.—TROOPER OR TRAITOR.

NOTHING had been heard of Bobby Pollet since his escape on the night when he played for the last time the trick of 'the whispering death;' but I felt sure that we should have to deal with him again, and when it came to the reckoning I meant to do my best to make it final.

The six months which had elapsed had been uneventful; but we had of late been busier, for there had been a good deal of horse-stealing. Only saddle-horses had been taken, and it was fairly certain that they had been hidden somewhere in the ranges; for the most careful watch had been kept on tracks and roads, as well as in the towns, where no attempt had yet been made to dispose of the stolen stock.

One evening, when we were lamenting our continued failure to catch these troublesome thieves or to recover the horses, some of which were very valuable, an idea suddenly occurred to me, and I said, 'Boys, there are other uses for horses besides making dishonest money by selling them.'

'Ay,' agreed Sandy Macneil, 'an' ane o' them is to carry rascals.'

'My word!' exclaimed Tom Foster; 'you mean that some one is forming a gang and collecting mounts for his men?'

'You've got it, Tom. Run over in your mind a number of "bad men," and try if you can hit upon one who would be likely to take to the bush if he got the chance.'

'Bobby Pollet!' Tom answered without hesitation. 'I was thinking only last night that it was about time we heard from him.'

'He's no' likely to send us written notice this time,' began Sandy, and then made a sudden grab at my collar and pulled me over backwards, chair and all, just as the roar of a heavy-calibre revolver was followed by the thud of a bullet against the wall behind me.

Before the report had died away Foster was out through the window, and we heard his footsteps as he raced in pursuit of the would-be assassin.

Sandy had caught me as I fell, and his face was very pale and his hands shook as he set me upright. I pressed them warmly. 'Thanks, Sandy! He would have had me that time but for your promptitude. I shall sit here again. Now trace the line of the bullet.'

Macneil glanced at me and then at the wall. 'It wad ha'e struck ye fairly in the centre o' the left temple,' he said. 'Man, I 'm glad I saw yon beggar in time, whaever he was.'

'Not much doubt about his identity,' I observed. 'Here comes Tom.—Well, Tom, did you catch Bobby Pollet?'

'You saw him, then?'

'No; but I am inclined to think that the one and only Bobby is the culprit.'

'You are right,' admitted Tom. 'I chased him for two or three hundred yards, and then he slung across a horse; and even had I been mounted I could not have caught him.'

'How 's that?'

'Because he was riding Aurora that was stolen from Timpany, and nothing ever yet caught that mare. As he galloped off the cheeky brute sang out, "So long, Tom Foster! Tell Sparks I 'll nail him yet. Don't trouble to pursue me; I 'm on Aurora." Then he sent a bullet at me; but he was too far off.'

'Owned up that he was riding Timpany's mare, did he? I tell you, boys, such confidence is not displayed for nothing,' I said. 'I suspect that we are in for a big thing. Bobby has formed a gang, and there will be stiff work before we break it up.'

'Ay, Bobby 'll tak' some beatin',' agreed Sandy. And Tom vowed fiercely, 'But we 'll beat him, all the same.'

Sandy went next morning to Baraldarong to recall Trooper Tarrant, lent to that township by me, and another trooper named Durfy, who had taken the place of Trooper Spiller, deceased. Tom and I rode over to Toomburra to secure a couple of good remounts; for the owner of the station, Mr Ingram, or 'the squire,' as he was more often styled, was accustomed to supply the Government with horses for the Mounted Police in all parts of the colonies—they were not states at that time.

The squire gave us a good dinner, and promised to send over the horses next day. He would no doubt have done so had not Mr Pollet

happened to have other views regarding their destination.

When we started to ride home the night was fine but gusty, with a half-moon occasionally obscured by drifting clouds which turned the bush suddenly black. During one of these spells of darkness, when we were within a quarter of a mile of the north-east corner of Squire Ingram's home horse-run, we both reined in on the same impulse, and Foster said, 'Did you hear that?'

'Rather!' I answered. 'The squire's turn appears to have come.' Until now Mr Ingram's horses had not been stolen, though almost every other owner in the district was groaning under loss.

'There it is again,' I said, as the unmistakable crack of a stock-whip reached our ears, faintly enough, for it was not being used with anything like full power.

We dismounted within a grove at the north-east corner, and stood with our hands covering our horses' nostrils lest they should neigh. We could hear the restless movements of a number of horses some little distance away, and while we waited expectantly the clouds flicked off the moon, and the half-light illumined an interesting scene.

About three hundred yards away a mob of some fifty horses were huddled together in an enclosure, with a dividing fence used for sorting out. As the light brightened, a man opened the dividing gate, jumped on to his mount, and rode slowly forward, followed with the docility of sheep by ten or a dozen horses. These were no sooner through than other four mounted men closed in on the rear of the procession to prevent any of the stolen steeds from 'breaking back.'

'Cheek!' exclaimed Foster, springing into the saddle. 'I don't think they'll bag that string to-night.'

'They will, though,' I differed, restraining him. 'Wait a bit,' as he began to protest. 'It is not a case of odds against us. If my eyes did not deceive me, Bobby Pollet headed that procession. Don't you see what a splendid opportunity this is to follow him to his hole?'

'My word, yes! I never thought of that. Come on, then.'

'I am not coming yet. You must trail that lot, and Sandy and I and the others will follow you. We will rendezvous at six o'clock to-morrow night in the ranges at the north end of Murderers' Gully, and I hope that you will have some news for us. Is that clear?'

'Perfectly!'

'Follow them as far as you think fit. If they take the Quondong track, you can get food and water at old Moreton's hut, which will keep you going until we come.'

'I'm not afraid.'

'I wish you were, Tom—just a little. Be cautious for your own sake, and also in order that we may have a good chance to break up this gang before they can start bushranging. Remember, Tom, you are one, and they are at least fifteen.'

'Five, you mean, sergeant.'

'Five just ahead of you; but thirty horses have been stolen, including those to-night. Reckoning two horses to a man, Bob Pollet has already a gang of fifteen.'

'My word! I never thought of that. I'll lookout. So long!'

We clasped hands. The task I had set Foster had its peculiar dangers, and we realised that we might not meet again.

My three lads arrived just after I reached home, and I told them to turn in soon after supper, as we should have to start before dawn. Michael Durfy was a man we knew nothing about, except that the Commissioner had sent him to Baraldarong, whence Tarrant had written describing him as the most silent man he had ever met. We found him so; for not a word escaped him but 'Yes,' 'No,' or 'Thank you' until we had lit our pipes, and then he electrified me by inquiring, 'Does Foster know the part of the ranges where you expect to find Pollet?'

'Who told you that we were going after Pollet?' I asked in my turn; for Bobby's name had not been mentioned in his presence. Macneil I had told, but no one else. I showed my surprise plainly; but Durfy answered quietly, 'I heard you telling Macneil. I was going back to the stable for my belt, and you didn't notice me.'

The answer was quite plausible, and in reply to his question I said, 'Foster knows no more than the rest of us where we may be obliged to go. Pollet may not be in the ranges at all. The direction we take will depend entirely upon Foster's report.—Now, boys, to bed. Combo,' our aboriginal servant, 'will rouse us in good time.'

I busied myself in my own room for a few minutes, heard various doors opened and shut, and then prepared to go out into the paddock to smoke and think.

As I reached the kitchen, where we had supped, the back-door opened, and, to my surprise, Durfy entered. 'I went to the stable for my belt,' he explained. 'I left it there after rubbing down my horse.'

'Oh, did you? Well, good-night again. I'm going for a stroll.'

Durfy proposed to accompany me; but this I would not hear of, and he went in, rather sullenly, I thought.

You remember the paddock and the bottle-brush tree from behind which Pollet's blackfellow had sped the first boomerang with its hideous whisper? I glanced at the tree, and as my gaze travelled beyond it I saw on the hillside a man running hard. Even in that light it was possible to recognise him for a blackfellow, and I wondered what he was doing there; for though

there were still many wild tribes at that date, we were not much troubled by them in our district.

I watched the black until he disappeared, and then walked slowly homewards, hardly knowing what to make of it. On the face of it, I was driven to suspect that he and Durfy had met, but I could not imagine why. A blackfellow, my surroundings, all recalled Pollet; but to link Pollet and Durfy together even in thought—to suspect one of the force of treachery—oh, ridiculous! The Commissioner knew Durfy, if I did not. Yet the man's reserve, the twice-offered flimsy excuse he had made about his belt, his effort, as it now seemed, to detain me talking inside the house—what was I to make of these? I went to bed wondering.

As Durfy and I rode in advance of the others through the dawn I said to him, 'I notice in the roll-book that there is a trooper of your name in the southern district.'

'Not now,' he answered. 'I was there, but I was transferred last June, and the Commissioner a month ago sent me to Baraldarong. You might have seen my name on the roll any time these six years, had you had occasion to look for it.'

So there was, after all, no mystery about him. Indeed, had I not caught sight of the blackfellow I should never have supposed that there was. It was curious, I thought, how one or two trifling circumstances had combined to make me suspicious of the man.

'I wish that we knew more about these ranges,' I said. 'We have not been stationed here long enough to do much in the way of exploring them.'

'Sergeant Sparks—sir—I'—— The self-contained Durfy was stammering like a bashful boy.

'What's wrong with you, Durfy?' I asked, surprised.

'I—I'd like—I ought to confide in you. I must indeed, in order to explain why I—— Sergeant, my name is not Durfy.'

'Not Durfy! What is it, then?'

'I am known as Durfy; but I am really Charles Levenhall.'

'Good heavens! Charles Levenhall! You! the son of old George Levenhall of Grassmiston, on the other side of Toomburra—the man who ruined'—— I broke off. Charles Levenhall had brought complete ruin upon his family by his worse than wild ways, and Grassmiston had passed into other hands.

The man hung his head. 'I am he,' he said huskily. 'No one knows but you.'

'I shall not betray your confidence,' I said coldly; for this man had wrought no common ruin upon a worthy stock. 'You joined the force as Durfy after you—after your disappearance six years ago?' He nodded. 'Why have you told me this?'

'To prove my good faith,' he said miserably. 'Can't you see the reason?'

I shook my head. I was at present occupied in trying to speak more cordially than I felt. There was something incongruous in the idea that one who had broken all social and most moral obligations should at once have transferred himself to the side of law and order. Still, as warmly as I could, I bade him cheer up, and told him he was still young enough to——

And then I suddenly understood. 'Why, if you are Charles Levenhall,' I cried, 'you must know this district well.'

'It was to convince you of that that I revealed my identity,' he answered. 'I can't, of course, guide you to Pollet; but I can take you to places the way into and out of which nobody could guess, and in one of these you may find him.'

'Do so, then,' I said curtly; for I could not bring myself to be cordial. His revelation had, in fact, astonished me; and although I believed his statement as to his identity, my half-formed suspicions of him returned in full force. He was reformed, he had assured me; but the things he had done—— No, I could not pretend to like him, though I recognised that he might be extraordinarily useful.

'Levenhall, or I had better continue to call you Durfy,' I said, 'I must tell the others. They will not betray you. They would suppose me mad if I put you, apparently a stranger, in a position of trust, unless they knew the circumstances.'

'Very well,' he acquiesced. 'I hope they won't throw my past in my face.'

'They are not the men to do that,' I assured him, and called a halt for breakfast, when I told Macneil and Tarrant what I had learned, having sent Durfy off to gather sticks. Tarrant openly expressed his sympathy with the man. But Sandy's mind I could not quite make out; on the whole, I considered him, like myself, inclined to suspect Durfy's good faith.

However, I had agreed to trust him; so, when he returned and started a fire, I said, 'After we have heard Foster's report, we will move, if necessary, under your guidance. If you find Pollet, we shall owe you a big debt of thanks.'

'I'll do my best, sir,' Durfy answered quietly; and, as I saw Macneil's eyes burning into his, I gave myself up to the business of breakfast.

About midday we passed Moreton's hut, and the old man told us that he had not noticed the passage of men and horses during the night, but that Foster had called for food and water at about eight that morning. 'There were a blackfellow came along five minutes after Mr Foster,' old Moreton added. 'He were trailing light [naked] an' workin' his nose up an' down just like a dorg. I thought he'd likely be one o' your trackers.'

A blackfellow again! Was I never to be done with blackfellows in connection with Pollet? The others did not overhear this communication, which I kept to myself.

At half-past six we reached the rendezvous; but Foster was not there, nor had he arrived at ten o'clock, when I took the first watch. At midnight I aroused Macneil; at two Tarrant was to come on, and Durfy at four. I was to be called at once if Foster arrived. I woke at two to see Macneil shaking drowsy Tarrant into wakefulness, and promptly went to sleep again. About half-past four I was again disturbed, and lay quite still, letting my eyes rove round our bivouac to see if I could discover the cause of my awakening.

Durfy was standing by the fire in a line with me, and I admired his alert and soldierly appearance. The next moment so savage an anger against him filled me that it needed little to make me shoot him where he stood. For there was a movement among the bushes on the opposite side of the stream, and Durfy, after a sharp scrutiny of each of us, stepped to the edge of the meadow-like strip which bordered the creek upon our side. A blackfellow instantly slid from the bushes, crossed the shallow creek, and stood before the traitor in the humble attitude of a slave. Durfy gave him an encouraging pat on the shoulder, and the aboriginal with extravagant gestures expressed his delight.

I heard not so much as a whisper; but a lengthy communication was made to him, and then Durfy, touching his chest and pointing away, indicated each of us, and held up five fingers. This was, of course, a notification of our number, including the absent one.

But the black shook his head and held up four fingers. Did this mean that Tom had come to grief? Durfy asked a question by a gesture, and the black answered it in vivid pantomime. Holding up his fingers to indicate ten, he suddenly swung up his arm and brought it swiftly down with a murderous gesture, after which he held out his right arm stiffly, and twice made the softest click with his tongue. Instantly afterwards he clapped his hand to his head and appeared to fall backwards. Then he held up eight fingers, and Durfy nodded, understanding, it seemed to me, that there had been a fight, in which Foster had downed two men.

But where was Foster himself?

It was amazing to see how swiftly these two communicated their ideas by means of clearly readable signs; but the black now expressed something in a pantomime which I could not follow. Whatever it was, it profoundly moved Durfy, who, starting back in what seemed to be horror, set his foot upon a dry stick, which snapped with a loud crack.

I never in my life saw any one disappear so quickly as did that blackfellow. He vanished in a space of time to be represented by the opening and shutting of the eyes, and had I not been watching him I might well have believed that I had dreamed his presence there. Durfy was almost as quick in returning to the fire, casting a keen glance at me as he passed.

I felt wrathful. I could not understand everything; but it was clear that Durfy was in communication with the black for no good purpose, and the latter's information as clearly pointed to Pollet and his gang. It was a shameful thought that a man wearing our uniform should associate with criminals and betray his own side; but from what I knew of Charles Levenhall's past, I was fairly certain that Pollet had a hold over him on account of some serious indiscretion, perhaps crime, of his wild days. Well, I was forearmed, and I would spoil the fellow's game; but I would first give him rope enough wherewith to hang himself.

(To be continued.)

ANIMALS OF MY ATLAS.

AN atlas is many things to many men. Before they become men, it is chiefly a volume of penitential associations, with its vermiform rivers and caterpillar mountain ranges, its dots of cities, and its blotches of lakes. In after-life its interest depends in great measure on how much a man has seen of the scenes symbolised in its restricted space. Even for the stay-at-home, its coloured counties and indented seacoasts must have their memories of holidays in summer sunshine; while to the traveller laid by the heels, and no longer able to fare forth on the long trail that was his delight in happier days, it is pregnant with reminders of the grandeur of mountains, the mystery of lakes, the babbling of rivers, the hum of cities, the stillness of the desert. For myself, I cannot look on a map of the Mediterranean without seeing little feluccas winging their way across blue bays, or on the void of the Sahara without my nostrils being filled with the unmistakable odour of shambling camels.

Our maps to-day, though they can never do more than approximate to absolute accuracy, are business-like portraits of the earth's surface, and altogether lack the picturesqueness of those older efforts which travellers used to sprinkle so liberally with little drawings of the birds, beasts, and fishes with which their vivid imagination, encouraged by the ignorance of their friends at home, peopled the remote spots of earth. These figures served a dual purpose, since they not only purported to indicate the actual fauna of

each region, but likewise filled in many a blank which might, but for their cheering presence, have challenged criticism of the scant information actually available. Thus in the famous Diego Ribero chart of Africa we find elephants and great fowl that may be presentments of Sindbad's roc doing duty from the Nile Valley downwards; and these animated studies emphasise a fact which every traveller learns sooner or later for himself, that there is more in these lands than meets the eye. Unless his specific object be the hunting of big game, the average traveller sees very little of the wild life of the jungle or mountains, for the wild life has learnt the uses of keeping out of his way. With a hundred indications of their presence, including the evidence of his own ears when of an evening he sits with his guides around the camp-fire, he may get never so much as a glimpse of these shy creatures of the forest. I have been tempted in an idle hour to fill up the spaces of so much of a blank Mercator as covers my own wanderings with the chief quadrupeds that have their home in those regions of five continents, and have then erased all that I did not see at large. The remnant is a poor menagerie indeed, for I have camped in Africa, yet never saw a lion there; I have plodded through jungle in Java without a sight of tiger or rhinoceros; I have made holiday in the Rocky Mountains without coming across even the tracks of a grizzly bear or puma; though I did once find recent claw-marks of a black bear on the outer posts of my veranda. Had I been out after big game, with an attendant regiment of trackers and beaters, I should no doubt have seen many of these creatures. Yet it would have been a glimpse of nature under conditions wholly artificial, a peep of the jungle stage-managed for my diversion, with the most timid creatures dashing blindly within a few yards of my rifle. Such manœuvring is inevitable in sport, and it is not for me to criticise it. All I maintain is that the sportsman sees the wild life of the jungle in a mood alien to the requirements of the naturalist; for, save where he sits in his *machan* over a kill, peering through the darkness at such creatures as come within his view, the *shikari* sees the wild animals only as they behave in presence of man, from whom, but for the terror inspired by the din of tomtoms and other devilment provided by the beaters, they would keep at respectful distance, thereby earning the character for wisdom given to them by the Brahmin who spoke on the subject to Alexander the Great.

If, compared with the resources of these tracts, my gallery of animals is a meagre one, its few portraits are the more dear to me. A coyote on the rolling prairie of Ontario, a group of kangaroos bounding over the stony plains of Queensland, the gigantic head of a moose peeping through summer foliage in the backwoods of Canada, a fight between a whale and three killers on the coast of New South Wales, macaques gibbering atop the Rock of Gibraltar, timid egrets hiding among the mangroves of Florida, and in that restful land of the Everglades another very different memory of a rattlesnake lying in my path at a sudden bend of the track, are all treasured more than any of the living wonders I have seen behind the bars in the Zoological Gardens of my travels.

The traveller in sympathy with animal life finds varied interest in the beasts and birds which themselves are greater travellers than he, or in those which, little given to migrating, are characteristic of certain regions, or, again, in the saddle or pack animals on which depends so much of the success and enjoyment of his wanderings. The albatross of the Southern Ocean, like the little lemming of the northern fjelds, is the prototype of his own restless ambitions, and appeals to him as more contented creatures never can. In another mood, his heart goes out to the patient camels, elephants, mules, and horses which bore the burden of his expeditions in lands where the locomotive has not yet penetrated. Yet perhaps in the autumn of life, when the youthful *Sturm und Drang* of the wander-years is gone for ever, he looks back with greatest affection to the types that stood for the scenes he learnt to love—the stag at gaze on the skyline, the humming-birds flashing among tropical flowers, the gorgeous butterflies floating down shaded rides of the jungle, the stately eagle wheeling over the bottomless abyss. The birds of prey are, indeed, the most insistent fowl of tropical memories, and of them I can recall strange variety, from great and ghoulish vultures poised over foothills of the Andes to the busy little 'John Crow' or turkey buzzard of the West Indies, from the kites that whistle in the rigging of ships anchored off Aden to the sea-eagles that peer defiantly from the sad cliffs of Australia.

Since the Nemesis of quarantine precludes a man from taking his favourite dog overseas, personal attachments are all for such horses as bear him comfortably in the heat of the desert or amid the pitfalls of hilly country. My own memories of lovable horseflesh are few; but there was a proud little barb, presented to me by a former Sultan of Morocco, which made great friends after one ineffectual attempt to end my uneventful history in a well; and there was another horse that, though not quite up to my riding weight, behaved with as much politeness as could be expected in the Yosemite Valley, carrying me out to Mirror Lake or to the Falls with exemplary patience and invariable decorum. Anything in the nature of frolic was in the circumstances beyond its powers. With least affection of all do I look reluctantly back to a spavined steed that I rode from Jerusalem to Jericho and back by way of the Jordan. This wheezy hireling, which hailed from the stud of a Jerusalem jobber, had an action so heart-breaking

that I had almost as soon have carried the wretched bag of bones as been borne by it, and all it did during our three days of partnership was to recall the excellent advice given in Proverbs: 'A whip for the horse, a rod for the fool's back.' It was both, but the rod should have been for him who was cajoled into hiring it.

THE CARRYING OF THE KELP.

By Helen Porter.

THE district known as the Burren is one of the bleakest spots in Ireland. The whole country seems petrified, as if a devastating blast from the Atlantic had turned it into stone. Then Nature appears to have repented her roughness and the cold monotony of her handiwork; for, after laying a groundwork of rocks, she covered it with a carpet of exquisite and delicate loveliness. Feathery fern, autumn-tinted bramble, golden moss, geranium, harebells, and blue scabious run riot over all, and in the damp patches between the gray stones silvery bog-cotton waves in the breeze.

The road winds close to the seashore, and the rugged, barren hills rise abruptly on its other side. There has been a shower, so the stones are wet and glistening in the chill morning light. A mist is rising, rolling its ghost-like swathes and folding the land in shadowy arms.

Maureen shivered as she leant her creel against a wall. Desolate as it was, it seemed attune to her mood. There was not a more miserable girl in Clare. Only ten minutes ago a side-car had passed—Corney's car, with the white jennet—and there he was himself, sitting up as pleased as Punch, with Honor Blake beside him. Maureen could still see the cold look he cast at her in passing, and the toss of Honor's head under her best hat, with its green feathers. With a sigh, she raised the rope over her shoulders and strode off towards the beach. She could see the thatched village nestling against the headland, but there was no smoke from any of the chimneys to-day. Wasn't every one at the 'pattern'? Wasn't she the born fool not to be going there too? If only she hadn't promised old Biddy. If only she had told the whole matter to Corney; but he wouldn't give her a chance. Last night he had asked her to go with him—asked her, and they all listening—and she had hesitated—hesitated, because of her word given to Bridget. Then his face had darkened, some girl giggled, and with a harsh 'Please yourself!' he had turned on his heel. Her timid, 'Sure, I'd love to go, Corney; only I promised,' would have passed unheeded; but he caught the last word. 'Promised, have you? Well, I'm not one to stand in your way, Miss Coneely!' Flinging it over his shoulder, he was gone.

Was this Corney—Corney, who had played with her as a child, whom she had known all her life, who never had a cross word for her till now? Thick tears blinded her sight, and she stumbled on the track leading to the hovel where the old woman awaited her, sitting on a creepie before the door.

'Is that you, alanna? You are a glad sight for sore eyes.'

'Yes, ma'am, I've come.'

'The blessin' of the Lord on you this day!'

'How are you feeling now?'

''Tis kilt entirely with the rheumatics I am, an' not able to stir hand or foot. I'd be lost without you. There is my bit of kelp gathered an' stacked on the shore, an' the spring-tide risin' to sweep it all away on me. If it wasn't for you, Maureen, 'tis ruinated I'd be.'

'But whyever did you lave it so late?'

'Why, because I'm an old woman, an' all my menfolk lie in the cruel sea. If my fine boys were alive! But there, 'tis the will of God. The neighbours promised, but they have enough to do for themselves, let alone others. May the Lord reward you, Maureen Coneely; you're the good girl!'

Maureen opened her mouth to speak, to air some of the bitterness which filled her heart; but she thought better of it, and refrained.

All day long she toiled, dragging the damp seaweed to a place of safety above high-water-mark. It was work she was well used to, and she was strong and not afraid of work. The glistening brown ribbons lashed her face and arms, and the salt wet ran down her bare legs, soaking her scanty petticoat. She laboured mechanically, thinking of nothing, feeling nothing, but conscious all the time of a dull ache at her heart. She had lost Corney—lost him for ever! All the past summer the fear of this day had been before her, and the blow had fallen at last. What would he be doing with a penniless wife? His father was a 'warm' farmer, and expected great things from his son.

Her task over, she made some tea and ate a dry crust in the old woman's cabin. It was very dark inside, dark and stuffy, and the smoke from the peat-fire was acrid and disagreeable. Bridget crooned to herself a song she had learned in her youth. Its effect was inexpressibly dreary. Maureen did not even smile at the words:

'When I was young an' pretty—
Now, faith, ye need not grin—
The boys they came from far an' wide
My hand an' heart to win.

To Paddy Burke I gave it,
The truth I tell to you;
An' every night, when he comes home,
He beats me black an' blue.

Oh Paddy, you're a villain!
Oh Paddy, you're a rogue!
There's nothing of ye Irish
Except your name an' brogue.'

She broke off suddenly. 'They tell me 'tis a great match they're makin' for Corney O'Brien. Have you heard of it?'

The girl shook her head.

'Honor Blake, she has a heifer an' a sow, an' 'tis said the old dad will give her fifty pounds.'

''Tis settled, then?'

'Sure enough. They say Father Bevan is pleased.'

'She went off to-day to the pattern on Corney's side-car.'

'Is that so? Oh, it's settled sure enough! So it was the pattern to-day? Didn't I forget! Not that I could have gone, anyhow. Why weren't you there?'

Maureen's eyes filled, and she could not answer for the lump in her throat.

'Was it because of my bit of kelp? May the Lord bless you! There's not many would give up a spree to help an old woman.'

'Maybe I was better out of it.' Before her rose a vision of Honor Blake in her cashmere dress, her gaudy hat, her elastic-side boots. Maureen did not even own a pair of boots. The contrast was too sharp. A tear splashed down her face. What was she that Corney should think twice of her? And yet she knew she had not been mistaken in fancying that he liked her. A faint ray of hope had struggled till now with her forebodings; but as Biddy ended it slowly died.

'He's a fine boy is Corney, but a bit forgetful at times. But, sure, I was once courtin' meself. It's not surprisin' he disremembered my kelp.'

'He promised to give you a hand with it?'

'Yes, a week ago; but he never came. Oh, he has other things to think of!'

The sun was beginning to sink, and the evening turned chilly. Maureen said good-bye. Her heart was full of pity for the helpless loneliness of the old woman, whose husband and sons had been drowned years before. How sad life was; how gray and solitary!

The faint blue had faded from the sky and from the ocean, and a dull leaden hue took its place. All round lay the giant boulders like the tombstones of her dead day-dreams, and the incoming tide lapping on the beach sounded like a dirge.

She went up the rocky path, and at the top paused for breath, turning, weary and discouraged, to lean on the wall.

Such wonder as met her sight! Never had she seen the like. The whole sky was suddenly illuminated with glory; its radiance fairly dazzled her. Everything seemed to float in a golden haze; the very stones shone molten, and the sea glowed with light. Half-blinded, she shaded her eyes with the back of her hand, but she could not turn away, and stood motionless. To think that behind the mist, the cloud, the darkness, lay all the splendour of heaven! Slowly the radiance vanished, fading into the gloom of twilight; but as she resumed her road the awe of its glory still shone in her lifted eyes.

'Corney, sure 'tis yourself!' She almost collided with the young man. 'Why, wherever are you going at such a rate?'

'Is that yourself, Maureen? I must be goin' down to Bridget's. Didn't I forget to bring up her bit of kelp! I fear me 'tis too late, an' the tide will soon be full in.'

'I carried it up myself,' said the girl simply. 'I promised her ere yesterday I'd do it.'

'So that was the promise that kept you from the pattern when I asked you, Maureen?' he said in astonishment.

'It is so.'

'An' why didn't you say it?' he added reproachfully.

'You would not listen.'

'Honor Blake declared there was another fellow in it—Mike Carthy.'

'Oh Corney! sure, there never was any one else in it at all'—— Her blue eyes were stinging with tears, and yet in them he could read the unspoken end of her phrase—'only you.'

He had her hands by now. 'I've been that wretched all day, longin' to get back. Jealous I was, Maureen. Then I remembered the old woman and her kelp, and made tracks'——

'Jealous, Corney! Sure, aren't you promised to Honor Blake?' she asked in such a tremulous voice.

'No, nor ever will be. Haven't you known, Maureen? Did you never guess? There never was any one else in it at all—but only you.'

The light had gone by now. All around were the gray rocks, the gray mist, the gray sky, and yet it seemed to these two as if they walked in a glory before which even the sunset paled, as hand in hand they went home.

CONTINUITY.

THE days that were can never cease to be;
Once having been, they live for evermore;
Far through our After echoes the Before,
As in each shell the murmur of the sea
Reverberates forgotten melody.
Dear, it is well we two have common store
Of linkèd memories that shall restore
The old loved themes to life's new harmony.

Love we the music dear, the soft refrain
And simple measure; hear the echoes gain
A fuller beauty from the voice of love;
And evermore with us remain
Till—earth's sweet song being sung—the lingering strain
Shall swell to undreamed harmony above.

Chambers's Journal
SEVENTH SERIES

THE HEART OF THINGS.

By Henry Leach.

London, *Yesterday.*

A SERIES of experiments upon human beings—known as readers—carried on through many years by leading editors has proved to demonstration that the public likes knowledge about the peculiarities of sections of itself that are to some extent abnormal, and also that it has a considerable taste for the gruesome. Give it happiness in print and soon it displays indications of being bored; but feed it on horrors and it will linger upon the dishes that you serve, to the neglect of social duties and business and professional affairs. Now it will be perceived that these two signs lead us at once, inevitably and with no alternative, to one particular idea that is the most attractive of all to this public, and it is the idea of the suicide club which, let us say by way of confirmation of our point, both in fiction and in fact has always been the most pronounced success. Robert Louis Stevenson wrote to the most excellent effect and gained the strongest appreciation of his readers when he made the creepy little story of the Suicide Club, which was turned by a French author into a play, and then turned back to English, and done in life by Mr Seymour Hicks at the Coliseum in London. Large audiences found nothing so good in its way as studying the agonies of men turning face upwards the playing-cards laid on the table before them, knowing that one of their number must have a card that, by the vows he had taken, would condemn him to death by his own hand. Then we watched the man who drew it go to his self-appointed doom, and particularly we beheld the writhings in most awful agony of him who was left alone in an apartment whence he could not escape, having drawn the fateful card, and being unwilling then to go forward to the consummation of his agreement. Watching such presentations of this idea is held by some to be the next most creepy thing to participating in the real routine of such a club, and has been found to be a most excellent sensation. But lately we have heard how this notion, having served so well in books and for plays, has been carried out most thoroughly in real life. It has been considered too good to be left as an idea, a thing for mere words or the imagination, and we have been reading in the newspapers thrilling accounts from their St Petersburg correspondents of how a real suicide club has been existing in the Russian capital, conducted on the most thorough lines, with proper observance of detail by all associates right up to the moment of resignation of membership not only of the club but of the whole human community. This suicide club of Russia has been shown to be a most horrible thing, attracting the most perfect loyalty from its members, and bringing about an appalling number of self-inflicted deaths in most tragic circumstances. Strange—is it not?—how this idea of playing with life and death appeals as nothing else will do to some neurotic temperaments aching always for the most sensuous thrills; and the number of such people is far greater than you may suppose.

* * *

Really this suicide club of St Petersburg can claim no originality even as an actual corporate and very serious body, apart from the organisations that are known in fiction. There have been suicide clubs before in various countries, though some care has been taken that as little publicity as possible should be given to their dark proceedings, and there is good reason to believe that there are some of them in existence at the present time. In saying that, one has most particularly the United States in mind, for that is the land where the club of this kind flourishes. One has not heard of anything of the kind in Britain, but there have been some of them in France. The Germans, I suspect, are not the sort of people who like to make compacts among themselves to die by their own hands at some future time which will not be of their own choosing. I recall among the most successful American institutions that which went by the title of the Order of the Black Veil, in which lots were drawn from time to time for a member to commit suicide, and to the member who was successful in the draw a black veil, black gloves, and black stockings were sent, the understanding being that he must take his life within a week of receiving them. Even in America, land of the most amazing publicity, the circumstances attending these affairs were seldom published in the papers. But do not some of you now remember in this connection the amazing development of a double tragedy

 [*All Rights Reserved.*]

that took place on the liner *Lucania* while on a voyage from New York to Liverpool just about three years ago? It is properly appropriate to our present consideration, for it was made clear that the victims, two single ladies, one named Clarke and the other Miller, were members of an American suicide club, and that it was that fact which was entirely responsible for their previously quite unaccountable deaths. These ladies shared the same second-class cabin on the steamship, they were both young, and at the beginning of the voyage both of them appeared to be in excellent spirits. But on the day after the *Lucania* left New York, Miss Clarke was found shot in her berth; and four days later, when the ship was near to Queenstown, Miss Miller was found dead in the cabin in exactly the same circumstances. It was afterwards ascertained that both were in possession of revolvers of the same pattern, and that each weapon bore the same secret mark, at first thought to be a trade-mark, but afterwards discovered to be the symbol of one of the suicide clubs of New York. It became clear that both ladies left America with the determination to obey the rule of their organisation, which demanded the death of their members at fixed periods.

* * *

The introduction of the mystic, the mysterious, the solemn, and the uncanny is to a certain extent of the essence of the idea of a real club, and in the case of the suicide organisations we have it carried to the extreme—to excess, as we might say. But there are many other strange clubs, and there have been more, the membership of which is not such an expensive thing, not costing us our very existence. Man has been known always as a gregarious animal, and—highly conventional as in these days he is—he likes upon occasion to be extremely opposite to that, and to practise peculiarities among a few of his own kind that are gathered together under special auspices and by a particular name. Collect half-a-dozen clubbable men and throw a good idea among them, and the making of a new club with a most excellent excuse for it is then an easy matter. In London I have encountered many strange clubs, and belonged to some of them. In the old days of the night-clubs—which are now almost all gone—there were some queer organisations, not by any means so reprehensible as the circumstance of their assemblies being held at times when non-members were for the most part spending their time in sleep and dreams might lead one to imagine. Not many weeks go by but an invitation comes one's way in London to be gathered into some new fold, with new things to do when in it, and more strange business to watch. I heard a little while since of a club to which members were only elected in pairs, and it was the condition of election that each of the twin candidates should certify that he and his brother-candidate had been sworn and most deadly enemies for a certain lengthy period of time—I think it was five years—and had renewed their old friendship, or made it for the first time, within one month of the date of the application to the committee. At the same time the reason for the former enmity was to be stated in full and signed with their joint names, so that the committee might judge if the cause were sufficient for such a deadly feud, for if it were not so the prospects of the candidates becoming elected would be imperilled. Here was good reason for a club, and it is one such as outsiders might pronounce a blessing upon, trusting that joy might go with it for all the days of those who should be on its roll.

* * *

It was about the end of 1909 that I was asked if I would be willing to take one of the numbers up to five hundred of a new club that was then being made, and was to be known as the 500 Club. I believe that it was duly established, though, not taking a number, I have not been kept informed of its proceedings. It was the scheme of several gentlemen connected with art and literary matters, who had among them a well-known restaurateur. This latter was an excellent thing, because artists and writers, even those best known to fame, are not all mind and soul, with no flesh-and-blood effects like grosser folk; but rather do they, by way of change and contrast, develop the corporeal side most thoroughly on occasions, especially that part of it which has association with the table. The restaurateur was there among them to give magnificent and exclusive advice, to help with new ideas for a club which was being thought about, and generally to assist them in the development of their tastes. His name is well enough known to those who have spent guineas at table in the fashionable restaurant part of the west end of London; so are those of the other leading spirits in this organisation. The club being made was to be like nothing else in the whole world of clubs. In the first place, the membership was to be limited to five hundred, and each member was to have his own number, the president being No. 0. Each member would let himself into the club with his own numbered key, which subsequently he would wear in his button-hole. Upon his entering the clubhouse he would find before him a large electric tablet bearing five hundred numbers, and then at once it was to become his duty to press the button below the number that belonged to him. This would cause a bell to ring and the number to be lit up in the hall and also in the great common room of the club. Thus, if you, reader, had joined this club, and were No. 157, it would at once be made known on your entering the place that 157 had arrived, and as 157, and not as

Algernon Something or Rudolph Other—your name being what it might be—you would be known all the time that you were inside. It was to be a club without visible waiters. Members would have to serve themselves at the club bar and pay for what they took at the same time. That it was to be a club for gentlemen is herein made quite clear. When it happened that light refreshments were required, it was planned that the order should be written down and placed on a revolving board, and on an electric button being touched, this board would revolve through an opening in the wall to a small room adjoining, where servants would be waiting unseen. What was required would then be placed upon the board, which would be twisted round again into the common room, where the member would partake of that which he desired. A rule was framed by which it was made obligatory that every member should make a speech, deliver a recitation, or sing a song, to be recorded on the phonograph belonging to the club, and preserved for the edification of future generations of members. A fine of sixpence was to be inflicted for addressing a member by name instead of by number, and a club anthem was written and composed. Here was one line of eccentricity.

* * *

A little while since I was glancing over the pages of a novel—I think it was *The Country House* of Mr John Galsworthy—in which a brief statement was made of the peculiar qualification attached to a club of which one of the leading characters in the book was a member. It was a club in Piccadilly called the Stoics, fronting on to the Green Park, was celebrated for the excellence of its wines and cuisine, was smart and aristocratic, and so good was the idea of its establishment that it had made a fortune for the inventor of it. The scheme was described as being simple, permanent, and perfect, and was embodied in the first of the rules of membership, which was that 'No member of this club shall have any occupation whatsoever.' Perhaps Mr Galsworthy may have had a particular existing club in mind when he prepared a little satire of this kind. Clearly the idea of a club for lazybones, some of whom might very well be described as good-for-nothings, persons who hated work and almost despised it, is sound. The members would have fine sympathy with each other, and would do much to brighten each other's lives, if indeed it were felt that they needed any brightening. But Mr Galsworthy and others may not know that the idea of the lazy, good-for-nothings' club has not merely been thought of before, but has been put into practice and become a magnificent success. The club, let it be seriously stated, is a social force, but not of a desirable kind. Outside its own membership it is thought of and considered most by the police, for the people who belong to it are of the degenerate class, and not such as have proper appreciation of wines and cuisine like the Stoics. It is called the Never Club, and this is how it was described by a London detective, whose business it is to know all about such matters, for the members are frequently within the grip of the law: 'It has a bigger membership than any other club in London, its members are thoroughbreds in that they are in no way associated with trade, commerce, or industry; indeed, any such contamination that may take place immediately disqualifies a member, and exposes him to forfeiture of all rights and privileges and summary expulsion from the club. It was given the name of the Never Club because the members never did work, never do work, and never will work. They never wash, they never pay, they never eat unless the food is begged or stolen, and they never sleep unless in prohibited premises or outside. They are loafers, hooligans, who wish to do nothing but skulk through life, and they are the cause of more trouble to the police of London than all other causes combined. Their organisation has ramifications in every part of London, and it is gaining in membership to a most alarming extent.' Strange it is, but this is really true. A little while since some of the members were brought up before the judge and jury at the Old Bailey on charges of housebreaking and cheque forgery, and were sentenced to various terms of imprisonment, and on that occasion a detective-inspector of police made some mention of the Never Club, giving particulars which exactly coincided with those which have just been quoted. And there is a rival organisation to this Never Club which goes by the name of the Sons of Rest. It might have been called the Junior Never Club, for its members are younger in years and experience than the others; they are in fact merely youths who sometime may get elected to the Nevers, and rest still more with the abundant satisfaction of an achievement done and a cachet fixed on their reputations. The Sons of Rest is a real organisation, with branches in different parts of the country. The last time I heard of it was at Bristol, on the occasion of one of the members being deprived of the privileges of all club and other society for three weeks in consequence of his having made provision for his needs by theft. The superintendent of police who was conducting this case explained that an alternative title to the club, adopted by the members themselves, was Sons of Dust. The members held their meetings on an ashpit, and one of their rules was that they were not to starve so long as they could get food. To the ordinary person such a regulation might appear absurd in its obviousness, but with the Sons of Rest a special significance attaches to the verb 'to get.' Then the members undertook to 'get' as much food as they could, and to share it, and not to work until they were

twenty-one years of age, and then to do as little work as they could.

* * *

But fustian clothes and prison dens do not properly harmonise with our thoughts on clubs, even the strangest clubs, so let us return to respectability and means, and see what London clubdom in its most freakish moods of inventiveness might possibly learn from New York, if it were ever disposed to accept any lesson from that progressive city. Friends who know it as well as any American does or ever did have given some odd particulars concerning the freak clubs there, some with good excuse existing, others with excuse made for the purpose. A little while since an Ananias Club was started in the city. It will at once and correctly be guessed that this was a band of brothers that in some way was associated with the utterance of untrue statements, and the actual *raison d'être* of it was the way into which Mr Roosevelt fell of dubbing a great variety of people by names which were not at all complimentary to them for this very reason, that he supposed them to say things falsely. Such persons, stigmatised by a man who had held the first position in the State, felt that a bond of sympathy united them, that they had a common meeting-ground, and accordingly they made themselves into a club to which they gave the title I have mentioned. Another American club of peculiar origin and constitution is the Alimony Club, consisting as it does of Americans who are condemned by the courts to pay alimony to divorced or separated wives. More recently than either of these an Indictment Club was formed, and was given much advertisement as a send-off. This club is composed of many eminent and representative citizens of the United States whose enterprise in commercial pursuits has been of such a character as to bring them within the consideration of judge and jury. Transgression of the Sherman Anti-Trust Law led to a qualification for membership that was frequently taken advantage of. Then there was started the Optimists' Club, which from the beginning was a very great success, securing seven hundred thousand members at an annual subscription of a dollar each. The members pledged themselves to look always on the bright side of things, the club motto was 'Smile,' and each member wore a 'smile pin.' These are such gloomy days in Britain, and there are so many misguided people preaching a gospel of darkness and sorrow, and doing their utmost, whether consciously or not, to make things worse, that one may be excused for the fancy that an Optimists' Club might do some useful work among us here, and a task worthy of its endeavour would be provided during weeks when great strikes are dislocating our life in general, and suffragettes rampant break all the windows in Piccadilly and the Strand. President Taft gave the Optimists of America his most cordial blessing, and said that their idea was distinctly good. Let somebody start an Optimists' Club in London with a serious programme of work arranged, and I will see to it that some person of high consequence shall pronounce a benediction on it.

* * *

A touch of pathos is attached to the circumstances belonging to two other clubs. It happened on Thanksgiving Day, 1847, that twenty young men belonging to Covington, Indiana, organised a club which came to be known as the Raging Tags' Club, because of the disposition of the members to make merry at the annual dinner which was held on the anniversary of the club's establishment. It was agreed among the score that the club should hold such a dinner until only one of them survived, and he then, in his solitude, was at last to open a bottle of port wine laid on the table at the first dinner that was held when the twenty were there all complete and jovial. On a recent Thanksgiving Day, the last survivor, Mr Lewis R. Hetfield, then eighty-four years of age, entered the club and took his seat at the table, which was laid in exactly the same way as it was when the twenty first sat down together. Mr Hetfield carved the turkey and opened the bottle of port, and, after he had paid a silent tribute to his nineteen departed friends, declared the club at an end, and was forthwith joined at the table by his wife and some of his relatives. The other of the two clubs to which I here specially refer is a club for centenarians, mainly recruited from the inmates of the Home for the Daughters of Jacob, many of whom have attained to most remarkable ages. The new club was joined by a number of sprightly persons of each sex, and it was officially stated that it had admitted to inferior membership as 'associates' several youthful nonagenarians who would in due course be qualified for full membership and have the votes which they coveted. I have heard of one other club started in America, the sentiment of which is not so nice and delicate as to some people it might at the first glance appear. A Mother's Day Club was started there, and the idea appealed so strongly to the American mind that over a million members were elected very quickly. The object of the club was to set aside one day yearly when everybody should wear some flower or badge 'in honour of my mother.' You, reader, would wear no flower or badge on one specially appointed day in honour of your mother, for it would be near to shamefulness to make a public celebration of a love and worship that abide strongly in your heart through every day and night of every year.

THE CAHUSAC MYSTERY.

CHAPTER XXIV.—BLINDERS.

ALICE'S letter had lain for four days in the pigeon-hole of Detching's desk before Cahusac received it. During those days she had grown nervously sensitive of the postman's coming, even though another anxiety pressed heavily upon her; for, after a rash burst of festivity on his own lines, Wil on the day following the Sheringham party had been seized with a heart-attack, which, considering the state of his health, might lead to serious results. For once Alice had asserted herself and insisted that he should be brought to Park Lane, where she could see that he was properly taken care of.

Mrs Westaway obstinately opposed such an unwelcome addition to her household, and might have succeeded in her opposition had not De Sarsan lent a very decided support to his fiancée's wishes. He had by no means forgotten the little incident described by Wil of the apparently agitated meeting between Cahusac and Alice which he had interrupted. In fact, De Sarsan had half-a-dozen purposes to serve, each stronger than the one which he put forward—the desire to please Alice. Wil was making heavier demands upon his pocket than he had expected, and the Belgian thought it was quite time that Wil's family took their turn in the way of maintaining him even for a few weeks; also, with her brother in the house, Alice could be depended on to leave him as seldom as possible, and meanwhile Wilford would exercise a certain amount of supervision over her. More important still, the marriage must be hastened. Altogether the arrangement suited De Sarsan exceedingly well, and Mrs Westaway, to her disgust, found herself entertaining not only Wilford, but a tall and capable nurse from the London Hospital, who knew exactly what the sick man needed, and saw that he got it.

And so it came about that the letter written by Cahusac, with its underlying note of tenderness and its warning, never reached the girl, who was so eagerly looking for it day after day. Had she received it she might have gained courage to face the future, for her heart would have been warm with the knowledge that Malcolm understood and forgave. But when, instead of the reply she counted on, there was silence, she believed him to be angry and changed, and she drooped visibly, for her spirit seemed broken. She had not believed Malcolm could be so unkind!

A cruel chance had thrown the letter into Wil's hands. Alice was alone with him when a servant brought up the mail for both; and Wil, seeing Malcolm's handwriting, slipped the envelope into his pocket unnoticed while his sister was pouring out some medicine.

De Sarsan happened to be in France when this incident occurred, and some days passed before he called at Mrs Westaway's. June was nearing its close, and he was glad to exchange the heated air outside for the coolness of the house. He asked for Miss Lanceley, and was taken into the study, where she presently joined him. But in the few minutes' interval he had time to glance round upon the room he had cause to remember so well, and to congratulate himself upon the bold move he had made more than seven years ago. He had triumphed then over Cahusac; and, as men count things precious, was his triumph not far greater now? Then he held the man's honour in his hands; now he held the woman Malcolm loved! His hatred of Cahusac and his self-complacency found utterance in a laugh.

Alice came in at the moment and glanced up at him in surprise.

'You were laughing!' she said. 'I thought there must be some one with you.'

She was looking very sweet, though very fragile, in a white gown. He took her hand and placed a fervent kiss upon it.

'I was thinking of my great good fortune and my happiness,' he replied with ardour.

There was about him a new air of boldness and possession which terrified Alice. She waited for him to speak again, and he talked glibly for some moments, and then made many inquiries about Wilford's condition.

'It sounds hopeful for the moment,' he observed when she had answered; 'but you know that he would be much better if he could always be with you.'

'Ah yes; but of course Aunt Marion would not care to have Wil here—very long.'

'He cannot remain with you under this roof, Alice; but under mine you could do as you pleased. Don't start, *ma cherie!* For his sake, if not for mine, we must not wait till September.'

She put her hand to her breast with a quick gasp of breath. 'But you promised—you promised—and I can't—I can't!'

'True, I did promise. But Wil was in far better health then. Come, dear, consider him rather than your trousseau.'

'Do you imagine that my trousseau'—— she began, but stopped suddenly. What was the use of talking when he knew so well that her trousseau had nothing to do with her reluctance?

'I hope that you are still a woman,' he returned with a smile, 'although I sometimes fear you are only a saint. See, I have ventured to bring an offering to your shrine to soften your heart towards me!' He laid a jewel-case upon her lap. He watched for the quickened interest,

the light in the eyes, with which most women would have received such a gift.

But Alice was plainly not moved at all; she did not attempt to touch the case, but raised her troubled eyes to him. 'But Wil is much—much better,' she faltered.

He shrugged his shoulders. 'You have heard what the doctors said.' Then, knowing the timid nature with which he was dealing, he went straight to his point; his tone was indeed tender, but it uttered her doom, and she heard him with a sickness of loathing. 'We must be married next month, July—say in a fortnight from to-day; and after our honeymoon you shall have Wil to live with us as soon as you like, sweetheart!' He took both her hands.

She turned away her eyes and shivered.

'Will you not even look at my gift?' he reproached her. 'It is a very special gift for a special day;' and then, as she made no movement to open the case, he opened it himself and laid a splendid collar of pearls and diamonds in her hands. 'It was my mother's,' he added, in a voice apparently shaken with emotion.

She drew her hands from it with a jerk. The idea that it had once lain close to the sallow throat of this man's mother only further repelled her. Madame de Sarsan had long been dead, and Alice had never so much as heard her mentioned before; but she at once endowed her with her son's attributes, and hated to touch the ornament she had worn. As a matter of fact, the feeling was entirely misplaced; for the collar, now reset, had never been the property of the late Madame de Sarsan, but of a charming Parisienne of position, from whom it had passed, by the not unusual channel of blackmail, directly into the hands of the Belgian.

Far from resenting her obvious distaste, De Sarson was conscious of a keen pleasure in his conquest, of a renewed zest of feeling for this aloof and fluttered girl, whom he was so soon to hold in his arms as his wife.

'Will you not let me see how it becomes you, *ma belle?*' he murmured with unmistakable ardour.

She rose hastily. 'This evening—I will wear it this evening. You are coming to dinner. Aunt Marion told me.'

'Well, I suppose I must yield. This evening it shall be. But meanwhile your acceptance of my little gift means that July is to see me the most happy man in the world.' He tightened his fingers on her wrist and drew her to his side.

'If it must be,' said the girl. She looked so young and so piteous that the man was enchanted.

'Yes, it must be,' he answered firmly, and waited for a few seconds to give his ultimatum due effect. 'Surely now, on this joyous day, you will permit me to seal our bargain.' He bent towards her.

But Alice, in the very desperation of her weakness, had held him to one compact from the first hour of her engagement: he might kiss her hand, but she would allow him no other privilege until she became his wife. Her growing repugnance to that future strengthened her now. 'No, no, no!' She drew away from him. 'Will you not see Wilford to-day? He is in my sitting-room upstairs.'

'In a fortnight you will not get rid of me so easily!' he laughed amorously. 'Yes, I will see Wil.'

He followed her from the room and up the staircase. At the first floor she stopped. Overwhelmed by his determination to hasten the marriage, she felt she must have time to collect herself.

'I will leave you to go on alone,' she said. 'I have to fetch a book for Aunt Marion from the drawing-room.'

De Sarson kissed his hand to her with *empressement* as he mounted the stairs to visit Wilford, when a door above opened and a big laugh floated out.

'Good-bye. All right! I'll look in again soon.'

The speaker, a soldierly-looking young fellow with a strong, rather ugly face, passed De Sarsan with a casual glance. The next moment it was evident that he had caught sight of Alice from the landing below.

'Hallo, Alice! it's good to see you again!'

'Billy! Why, I thought you were in Canada! It is such ages since you went away!'

How different Alice's voice sounded now! thought De Sarsan.

'Two years and more! I feel like Rip van Winkle when I look in at the clubs and see the youngsters who have grown up since my day!'

Billy's talk drew a faint laugh from the girl. 'You are not much changed,' she said. 'No, no, Billy!'

De Sarson stiffened where he stood listening.

'What! you won't kiss me? Why not? You always used to kiss me when I came home before!' said Billy, aggrieved.

'It's different now,' faltered Alice. 'I am engaged.'

'To be married! To whom? Why wasn't I told? To whom?'

'You—you must have met him on the staircase.'

De Sarsan clenched his hands, for he could hear that Alice was ashamed as she said it—ashamed to own her future husband.

'Good Lord! not to that boun—I mean foreigner?'

There could be no mistake about Billy's shocked intonation. Alice made no audible reply, but the young man spoke again at once. 'Why, you're fearfully pale, Alice! Come to the light and let me look at you. Wil has been overtiring you, and you want as much care

as he does! My word, I'll talk to Aunt Marion!'

With that the speakers must have moved into the farther drawing-room, for De Sarsan could hear no more than a vague murmur. He opened Wil's door with an angry hand. 'Who's that man I met going down?' he asked brusquely.

Now, although Wil still desired, for his own purposes, to play De Sarsan's game, he had long ago ceased to like him, and was maliciously ready to seize upon any chance of annoying him.

'Who! Why, old Blinders, I suppose,' he answered without turning his head.

'*Ach!* a young man! I mean a young man!'

'Well, Blinders is a young man!' said Wil composedly.

'*Tiens!* it is, then, a nickname such as you use in your imbecile English society?' rasped out De Sarsan.

Wil cocked a furtive eye at his companion. What the dickens had Blinders done to rile De Sarsan so badly? Good old Blinders! 'It is exactly that, a nickname such as we use in our English society, and which naturally is not known to'—Wil paused—'outsiders.'

De Sarsan choked. He had lived too long in England not to understand the second slang meaning of the word. 'Well, who is this Blinders?'

'Speak respectfully, my dear friend! He used to be Billy Linders, and a couple of years ago he took on an A.D.C. job to the Governor-General of Canada, chiefly to be handy for big-game shooting. Now his uncle is dead, and Billy has become Lord Lindersmere, the head of the family.'

'Whose family?'

'Mine,' replied Wil.

'Perhaps he will be so good as to support you, then!' snapped out De Sarsan.

'He might, if I put it to him, for he is a first-rate fellow,' said Wil thoughtfully. 'But it would be likely to upset your apple-cart if he did, you know.' He grinned as he glanced at his companion. 'Billy's is not one of your rotten thirteen-for-a-penny titles they sport in your country, De Sarsan; but a sound English earldom, with money and pedigree and prestige behind it—and don't you forget that!'

'It is not probable that I shall forget, as your sound English earl will be my cousin within a fortnight,' retorted the Belgian.

'No!' exclaimed Wil incredulously. 'Has Alice consented?'

'Of course she has.'

'Oh my! Who's to break the news to Blinders, I wonder? It's a lucky thing that people don't often die of joy, isn't it?' said Wil, in high feather at the opportunity of irritating De Sarsan, which did not come in his way as often as he could have wished; 'or there's no saying what might happen to Blinders!'

Now Wilford had quite intended to make over Cahusac's letter, which he had suppressed, to De Sarsan; but the return of Blinders had rather altered the situation. Wilford regarded De Sarsan as stingy, and foresaw that it might suit his game to permit Alice to marry Cahusac after all—that is, if Billy could be brought to see that his family had claims upon him and his purse. Anyhow, he determined to keep the letter for the present, and act as jumped best with his own interests when time revealed what those interests would be.

'Has Cahusac also come to see you?' inquired De Sarsan, after some conversation.

Wil shook his head. 'No. Some one said he'd been fired by the Foreign Office; but he isn't likely to sit down under it, if there's anything to be cleared up about those nasty rumours in the newspapers. He'll have plenty of time to give to his own affairs now.'

De Sarsan looked at him with a sudden sharpness. 'What do you know of his affairs? Has he ever spoken of them to you?'

'Good heavens, no! They don't interest me.' And upon this the conversation turned to other topics.

De Sarsan left without the letter; but, as luck would have it, when Blinders had extracted some of the facts of Wil's financial doings and details of Alice's engagement from Mrs Westaway, even though it was an expurgated edition of the story made to suit the lady's own connection with the business, his frame of mind precluded any desire for further intercourse with the invalid.

'But, Aunt Marion, you can't make me believe that Alice wants to marry that Belgian?' urged Billy, as he recalled the middle-aged figure of De Sarsan, with its yearly filling waistcoat and conspicuous lack of those attributes which he believed such a girl as his young cousin would demand in a husband.

Mrs Westaway, who still possessed a mass of fair hair and a pretty colour, put on her gentlest and most deprecating air. 'My dear boy,' she said to her nephew, 'Alice is really incomprehensible. 'I cannot explain how Wil's money affairs became so entangled; but I assure you if Alice had only listened to reason they could have been arranged somehow. She would, however, have her own way. She chose to take this man's advice, and as she was of age what could one do?'

'But, see here, aunt, that is quite another business to marrying the fellow! You won't get me to believe she is doing that of her own free will!' Billy was a very persistent person.

Mrs Westaway shook her graceful blonde head. 'I can only tell you, Billy, that he came here one day and talked to me about it. I was dreadfully upset at the idea; but he appears to have plenty of money, and she seemed to have made up her mind to accept him. I am quite as puzzled as you are.'

Billy frowned in perplexity. Of course he had no right to interfere. But Alice, of all

girls! 'And what has become of Alice's own fortune?' he inquired.

'She made most of it over to Wil.'

'I only wish Wil was in a condition to stand such a licking as he deserves!' exclaimed Lord Lindersmere hotly. 'I say, is there nothing we can do to put a stop to Alice's making a fool of herself?'

Mrs Westaway was sympathetic, but had no suggestion to offer; and when presently Blinders went off discontentedly, she watched him from the window.

'Put a stop to it!' she said to herself. 'Not I. No one else would take Wil off our hands. And I won't permit you to spoil that arrangement, my dear boy.'

The upshot was that Wil, finding Blinders unaccountably slow in any offer of help, turned back upon De Sarsan as his only resource. Thus Cahusac's intercepted letter passed into the Belgian's hands, who read and promptly burned it, an act which had a far-reaching influence on more lives than one.

(To be continued.)

BRITISH CAPTAINS IN POLAR RUSSIA.

By R. S. Latimer, Author of *Under Three Tsars, Dr Baedeker in Russia*, &c.

FROM Liverpool to the mouth of the river Yenesei is one of the most perilous voyages on this globe. That so few have succeeded in making the passage to the Kara Sea and returned alive to Western Europe before this twentieth century is sufficiently eloquent proof of this. Captain Webster's recent exploit (1911) is a sensational reminder that the Yenesei is to-day within reach of Liverpool by steamship.

Captain Webster was not the first British seaman to adventure upon this route. The earliest voyagers to Polar Russia were the 'merchant adventurers' of the days of Edward the Sixth. They bore a letter from our English monarch ambiguously addressed 'To the Northern and Eastern Sovereigns.' It was quite uncertain when they weighed anchor in the Thames what high dignitaries and authorities they might meet with ere they returned. As a matter of fact, few of them did return. Of the three vessels, two were wrecked, and the sailors (including Sir Hugh Willoughby, the commander) were drowned or frozen to death. The third reached the White Sea and Archangel, and gave the inhabitants an even greater fright than Captain Webster has just given the people along the banks of the Yenesei.

Captain Chancellor was escorted to Moscow, was received by the Tsar, and ate and drank in the Kremlin Palace from plates and goblets of gold and silver, being waited upon by a great crowd of magnificently attired servants.

These first British navigators opened the gates of the seas to the Russian Empire. The result of their visit was the building of the town of Archangel. It is almost incredible that for many years after the building of this town on the White Sea the Tsars of Russia possessed no other seaport in any part of their dominions, no other outlet by water to the great world. Hemmed in on every side by the Swedes, Poles, Turks, and Tartars, this young giant-empire was completely landlocked. Swathed in her impenetrable forests, she knew but little of what was passing in the world. Chancellor, unknown to her at the time, opened for her a way out of her age-long imprisonment. 'I do not want any more land. I want water!' cried the boat-building Peter the Great, as he wrested the Sea of Azov from the Turks and the Caspian Sea from the Persians.

The expedition of Chancellor did not pass the Kara Straits. Since those days many a good ship has been dashed to pieces on that awful coast.

Captain Erasmus Ommanney commanded an expedition to the Arctic Seas and the northern coast of Russia on the outbreak of the Crimean war. His visit will never be forgotten in Russia, particularly by the Orthodox Church, who regard their deliverance from his guns as a miracle from heaven. The arrival of the British ships of war in the White Sea caused great consternation in Archangel and among the inhabitants of the neighbouring fishing-villages. The monks of the Solovetsky Monastery preserve in their records a vivid and pathetic account of the bombardment of their fortified buildings, and of their salvation from the enemy after many prayers uttered over 'the graves of the saints.' 'It cannot be that God has not heard our prayers, seeing that we prayed with tears in our eyes!' one devout monk exclaimed when the cannon-balls of the British ships began to drop among them and death stared them in the face. But the place was not taken. Captain Ommanney, evidently thinking that it was not worth powder and shot, sailed quietly away. And although other British vessels afterwards called at the monastery, no greater damage was inflicted upon the inhabitants than the abstraction of a few sheep and loaves to replenish the ships' depleted stores. The monks to this day proudly show to visitors the effects of the cannonade as evidence of miraculous interposition for their protection.

Captain Ommanney was a fighting-man and not an explorer; he did not, therefore, venture to sail his battleships through the dreaded Kara Straits and into the mysterious regions of eternal ice beyond.

To Captain Wiggins belongs the honour of having opened to Europe a route past Novaia Zemlia, through the Straits of Kara, to the mouths of the mighty rivers the Obi and the Yenesei, which are for greatness the Nile and the Congo of Northern Asia. How different was his reception and treatment by the Russians from that unfortunately accorded to Captain Webster! The latter was the victim of extortion, insult, and even imprisonment at the hands of the local authorities. It is but fair to say that St Petersburg has since sought to make amends for such unhandsome conduct on the part of its representatives. When Captain Wiggins arrived, the mayor of a Siberian town, at a banquet in his honour, thus complimented him: 'The Kara Sea, as if satiated with many victims of bygone years, took you caressingly to its cold embrace; and its waters carried you as a conqueror to your goal. We have as yet no steamers to send to Europe; but let us express our most profound gratitude to him who opened this route, if not for us, for our posterity.'

Wiggins was a profoundly religious man, of unblemished reputation, trusted and beloved by all who came into intimate contact with him. His teetotal habits were a great astonishment to the Russians. This great exploit of his, which places him in the front rank of explorers, was robbed of its fruitful results to Anglo-Russian commerce by the ignorance, vanity, and rashness of those who sought to profit by the possibilities he had opened to their view. Without listening to his counsels, a small fleet of British trading-vessels of quite unsuitable build, and officered by inexperienced men, steamed eagerly to the north-east, with cargoes to exchange for Siberian products. The speculation was a complete failure, shoals and pack-ice and their ignorance of the route baffling the self-confident navigators. They brought their cargoes home again; and it began to be thought that the route could never be made a commercial success. To this idea Captain Webster has now given the death-blow.

The question of the transportation of Siberian produce to the markets of Europe, and particularly to England, is to-day a burning question in Asiatic Russia. Nothing would so effectually aid the opening up of the enormous wealth of the Siberian resources as inexpensive means of conveyance for their products. The rapid increase of the population would follow as a natural consequence, as is the case with Canada. All sorts of plans are suggested and routes discussed, including even flying-machines! Siberia can never develop until these better facilities for import and export are devised. 'If Russia has neglected her maritime trade,' say the enterprising Siberians, 'that is no reason why we should do so.' They blame the jealousy of the inland monopolist merchants of Moscow and other great distributing centres and the prohibitory tariff for the checking of interest in the development of this northern ocean highway. At first the Government, to encourage the Siberian trade, allowed sea-borne goods to be imported duty free. For a few years the Siberians indulged the hope that they would be able to get goods better in quality and much more cheaply from Manchester by sea than from Moscow by rail. This would never do for the Russian merchants. They clearly saw that if this continued the 'hope of their gains was gone.' They appealed to the Government, to whom apparently the profits of a few monopolists were of greater importance than the prosperity of half a continent. Prohibitive duties were reimposed, and the Siberians were left with a very restricted market for their goods, and high railway rates greatly increasing the cost of those commodities that they are compelled to purchase. 'The new route was working a revolution in prices,' said an observant Englishman on the spot. The high tariff has not, however, prevented the persistent discussion of the question, which the enterprise of Captain Webster will make more prominent than ever. Only last year a Russian sea-captain, Seletsky, appealed earnestly in the *Archangel News* to the Russian Government to aid in the development of Northern Siberia by means of her own sea-borne commerce. He pointed out that on her northern coasts Russia possesses a sea frontage of upwards of twelve thousand miles, and nearly two hundred thousand miles of inland waterways, all of which are at present out of touch with the outside world except through the efforts of foreigners. The regions accessible by these waterways possess untold riches; the mines of the northern Urals and the Altai Mountains (*Altai* signifies 'golden') produce not only gold, but platinum, silver, and almost all minerals and precious stones. The seas and rivers swarm with fish, the forests yield illimitable supplies of timber and furs, and the possibilities of agriculture are unbounded. The idea that a cold climate is an impediment to cultivation is said to be now an obsolete prejudice in the light of modern experience.

Since the days when the outlaw Yermak laid Siberia at the feet of Ivan the Terrible, over two hundred years ago, this vast northern half of the continent of Asia has been the hunting-ground of the most desperate adventurers of Europe. Little by little the Russian frontier has been pushed farther east, from one mountain-range to another, and from one enormous river to the next, until it has reached the frozen shores of the Pacific Ocean. The principal Siberian rivers flow northward into the Arctic Ocean. The Obi and the Yenesei are each nearly four thousand miles in length, and are navigable almost from the Mongolian frontier to the ocean—that is, right across Siberia, northwards. To the mouths of these rivers convicts (criminal and religious) have for many years been sent from European Russia. These remote regions are the loneliest

and most inhospitable that can be imagined. The unbroken silence of centuries broods over thousands of miles of snow that glitters under the rosy Northern Lights and the brilliant and variegated moonshine, or the rarer rays of the feeble sun. This polar 'tundra-region' is a desolate, frozen swamp. The soil never really thaws, and only the lowest forms of organic life, lichens and mosses, maintain an existence. Farther south the fir and pine forests begin; and in the brief summer-time the floral carpet is of marvellous loveliness. Here the Arctic fur-hunters snare their prey; and in the tiny hamlets of the native tribes, who have but the merest rudiments of civilisation, the Russian exiles starve out their weary existence, and yearn for their far-distant homes and friends. Occasionally one or two escape. They are usually recaptured, or frozen to death if caught by the terrific winter ere they can get out of the country, or are eaten by wolves or else by other fugitives. Cannibalism among escaped prisoners is by no means unknown.

In a London East End lodging-house two years ago a young woman was found who had just succeeded in escaping from this cruel region. A young man, a Jew, planned the desperate adventure with her. Possessing a few roubles, they bought a tiny boat, and rowed about eighty miles down the river Angara, a tributary of the Yenesei. Then they found help, and rowed about a hundred and twenty miles farther, always in terror in the daylight lest they should be discovered and rearrested. 'Cold? Our hands at times were actually frozen to the oars,' she said. By the help of friends and by means of false passports they ultimately escaped.

The rich and fertile watersheds of the upper reaches of the great rivers are the regions that will absorb the imports from Great Britain and other lands, and in return will pour out in increasing volume the exhaustless wealth of Siberia over the world. On the banks of these rivers the cities are built. Russian steamship companies already trade for hundreds of miles along their banks. In the summer season they are navigable to the Polar Sea. Suitable boats and skill and seamanship alone are needful to do what Wiggins and Webster have under many difficulties accomplished. For British trade this sea-route is of increasing importance in view of the future expansion of Siberia agriculturally, industrially, and as a purchasing market. If our woollens and cottons can be imported to this great Canada of the East, so much better for the Siberian population and for ourselves. If at the same time—for commerce is but the exchange of commodities—vast new corn-fields and granaries are rendered easily available for our needs, and if from the great rivers of the white north, as well as from the Danube and the Don in the south, can come increasing supplies to our ports, the Siberian growers as well as the British consumers will reap immense benefit.

SOME ADVENTURES OF SERGEANT SPARKS, OF THE MOUNTED POLICE.

II.—TROOPER OR TRAITOR—*Continued.*

PUNCTUALLY at six Durfy roused us with a quiet 'Good-morning,' and went to plunge his head and shoulders in the cold water of the creek. Even in my detestation of his wickedness, I could not help admiring his magnificent physique. At breakfast he was as silent as usual; but afterwards, when Sandy asked my plans, he put in his word, as I may say I fully expected him to do.

'I think, sir,' he said in his even voice, 'it would be well if you would allow me to begin at once my duties as guide.'

'Why so, Durfy?' I asked, thinking what a cool hand he was.

'I have been recalling the features of the locality,' he replied, 'and, if my memory serves me, I can take you to a place where you may learn something of Pollet's ways.'

It struck me that he chose each word carefully before giving it utterance. 'Are you sure that it will be worth our while to go?' I inquired.

'Oh yes,' he said more eagerly; 'because—' he checked himself and continued deliberately—'because the knowledge of the place I have in mind will be useful to you, even though we find no one there to-day.'

I thought that his brown cheeks paled for an instant, and then I believed that I had hit upon the explanation of his mood. 'My word! this is a curious type. The fellow hates Pollet, I'll be bound, though he is obliged to help him, and he is going to try to trick Bobby too. False to both sides, the poor wretch is bound to suffer, whichever of us gets hold of him when all is done.'

I must have lost myself in thought, for Durfy had the hardihood to say, 'You had better do as I suggest, sergeant.'

And I snapped back, 'When I have made up my mind I will answer you.'

'And while you are making up your mind,' he flashed out, 'the bushrangers'—— He choked back something, drew himself up, and saluted with an apology.

'Finish your remark,' I said graciously.

'I meant, sir, that every moment is precious.'

'Why, man, you talk as if you were certain of results,' I said with a sneer I could not wholly repress. 'Well, go ahead!'

The red rushed up under his tan, and he simply hurled himself at his horse, and was ready, swag rolled and all, before any of us.

In case of accident, I gave Sandy an outline of what had passed in the early morning. 'If there's treachery,' I said, 'you will know what to do.'

Sandy nodded and turned away, and for the first time I considered him unsympathetic. He did not seem at all impressed.

We cut an arrow, pointing south-west, on a tree as a guide to our general direction in case Foster should turn up, and then Durfy led us at a hand-gallop for five miles without even turning his head to see if we followed.

'He is in a tearing hurry,' I said to Sandy. 'He has sent word to Pollet that he will be promptly on hand with the victims. Just look at him.'

We were galloping now between tall trees, and always ascending. Nothing stopped Durfy. He sent his horse over fallen trunks as high as five-barred gates, and went over gaps and up and down steep gullies as if they had not existed. Had we been pursuing Pollet, with the bush-ranger in full view, he could not have ridden at a madder pace. I was just about to call a halt —for I saw no reason why we should be rushed into danger—when Durfy pulled up so suddenly that we nearly rode him down.

'Peg-out horses here. Can't ride farther,' he said breathlessly, and acted while he talked; for before any of us were ready he was off at a long, swinging stride.

'Come back, Durfy!' I called. 'How can we communicate with you if you keep so far ahead?'

He seemed inclined to be mutinous, but, after a quick, frowning glance, fell in between me and Sandy, who had come up on his other side in response to a wink from me. Always calm, Sandy now looked even more cheerful than usual.

Thus we entered a narrow valley, high up in the ranges, where a track ran between sides which sloped very sharply and were covered with boulders. The track was a natural one, and a thin stream, about its own width—say, three feet—trickled beside it. Here and there the way was blocked by big rocks, and shrubs grew thickly, but in patches, on the hillsides, with now and again an infrequent tree.

'You could not find a better place for an ambush,' I said, ostensibly to Sandy, though I looked a moment later at Durfy. And then this mysterious man made an extraordinary remark.

'Good heavens! Yes, I quite forgot,' he cried. 'Your revolvers!'

'Are quite ready, Durfy,' I said significantly, and held up mine.

'Then keep a good lookout. They may be anywhere in a place like this. I'll scout ahead.'

He was off at a bound and out of sight round a boulder before I could stop him. I did indeed raise my revolver, but lowered it again. 'We are in for it, Sandy,' I said. 'We were rather fools to come, but I wanted to learn all I could.' Tarrant assented, but Sandy only smiled. I supposed that he had made up his mind that we should somehow muddle through.

We advanced cautiously to the boulder round which Durfy had bolted, when a loud shout startled us, and we slipped round it, to see Durfy, a hundred yards ahead, running like a deer.

But it was not the sight of him that quickened our pace into a mad rush. Fifty yards beyond him, a solitary tree, dead and branchless, stuck up from the track six feet from the stream; and tightly bound to it, his hat off, his head fallen forward, was a trooper in uniform.

'Foster!' burst from our lips, and we raced after Durfy. But he had a good start, and long before we were up with him his knife had slashed through those cruel bonds and his arm was around poor Tom, drawing him away from the agony of that stake. For in that fiery sun, with the torture of the cool mountain stream ever gliding by him, the wretched prisoner must have suffered tortures beside which those of Tantalus were easy.

But Tom Foster was game to the backbone, and as we caught him from Durfy's arms and laid him gently down he smiled at us, and from his cracked and blackened lips fell falteringly the unselfish warning, 'Never mind me—trap—Pollet—expected you—ambush—higher—up—I'—— Then he fainted.

Tarrant dashed the contents of his water-bottle over Tom's head and sprang to the stream for a cooler supply; but Durfy was already bringing it. We forced a little diluted spirit between the clenched teeth, and Sandy and I chafed the wrists where the rawhide bonds had dented the flesh. The poor fellow's hands were purple with stagnating blood, but his feet were not so bad, for his riding-boots had resisted the pressure of the lashings. I wondered, while I was thankful, that they had not stripped him before exposing him to the sun.

Busy as I was, I did not forget the words Tom had uttered, which Durfy, too, must have heard. Yet his expression was merely anxious, not at all discomposed. I looked at Macneil, and to my surprise, and indeed indignation, he was smiling benevolently upon the culprit, whose whole attention was given to Tom.

This was all very well; but in cutting Tom loose he had done nothing to excuse his treachery. I knew now that it was the black's story of Tom's capture and impending torture which had so moved him. That was why he had galloped

and run ahead so madly. He had not shrunk from betraying us to our deaths, but he had sentimental objections to the torture of a fellow-being. I felt no kindness to him for his effort to undo part of the harm he had done; the more, perhaps, because I was myself blameworthy.

Suspicious of the fellow, I had yet, out of sheer pride and self-conceit, allowed him to bring my men into this trap. I had not liked to knuckle under to Pollet, and I had wished to show Durfy that he had not succeeded in fooling me as completely as he supposed he had done. The one good result of our coming was the rescue of Tom. Apart from that, I was, though in a different sense, as much to blame as Durfy for the fix we were in.

My orders were sharp and to the point. Tom had come round, and it behoved us as quickly as possible to get out of the danger-zone. 'Macneil and Tarrant, carry Foster,' I directed. 'Durfy, walk ahead. I will bring up the rear.'

'I can walk,' protested Tom. 'I'm all right, thanks to you all—and to you.' He looked gratefully at Durfy, who was putting away his flask. The traitor nodded and smiled at him.

I felt positively angry with them all. 'Walk, then,' I snapped; 'but get on out of this death-trap.'

'Beg pardon, sergeant,' said Durfy, 'don't you think that we had better leave Foster behind that stone, where he'll be safe?'

I looked at him in amazement. 'Are you mad, Durfy? Abandon Foster! I'——

'Abandon him! Certainly not, sir. We will come back for him if he does not come after us; but he is hardly fit to fight.'

'Of course he can't fight!' I cried hotly. 'That is why I gave the order to retreat.'

'Retreat!' echoed Durfy, apparently amazed in his turn. 'I thought you meant advance when you told me to go ahead. As I am guide, it was a natural conclusion. I was rather surprised when you spoke of bringing up the rear.'

I distinctly heard a chuckle from Sandy.

The amazing impudence of this speech sent me into a rage, and I began a storm of violent words. 'Trooper Durfy, I know you, remember. I have you covered. One movement to signal'——

A hand grasped my wrist and Sandy's voice said coolly, 'Gi'e the mon a chance to fight for us, if he's inclined, sergeant. We can argue wi' him efterwards—if we get the chance; for here they come!'

'Take cover!' I cried, springing to Foster's side. The unaccountable Durfy was again beforehand with me, so we supported Tom to a spot behind a big rock, and there set him down. I handed him one of my revolvers and turned to the other man. 'There is time for only one word, Levenhall,' I threatened. 'If you attempt to help your friends, I shall shoot you without mercy.'

The cool fellow smiled at me. 'That's rather hard luck, sergeant,' he retorted. 'I'll think about it;' and before I could do anything he had dodged behind a boulder.

'What on earth'—— began Tom; but I silenced him, for I could see up the valley a dozen men dodging from rock to rock. Pollet had evidently been reinforced, and things looked nasty for us. If it had not been for that traitor, Durfy——

Imagine my state of mind when, as I watched his cover, expecting I knew not what foul stroke, I saw the shining barrel of his rifle thrust over the top of the rock. There was a spurt of flame, and the sharp crack was instantly followed by a loud yell as a bushranger sprang into the air and rolled down the slope dead.

'Weel dune!' shouted Sandy; and then Durfy's voice, with a new cheerfulness in it, came to me, 'I'm taking chances and helping my friends. Don't be too hard on me, sergeant.' Sandy, in his cover, laughed uproariously; while I seriously thought that the sun had affected everybody but myself and Tarrant.

I had no time to unravel mysteries, for a volley spattered upon the rocks, doing no harm. The gang tried another volley, and then gave it up and fired singly from cover, every now and then dodging a little nearer, and evidently intending to rush us sooner or later.

Macneil's rifle spoke, and then Tarrant's, and both crippled but did not kill. A man raced from one rock to another, and I brought him down with a broken thigh; and then Pollet's voice rang out angrily, ordering his men to charge in a body. 'Foster's out of it!' he yelled. 'We're more than two to one.' He was satisfied, apparently, that Durfy had gone back on him. I called to my fellows to be steady and not waste a shot.

'I'll mark you, anyway, Sparks!' yelled Pollet, and I felt a ball graze the skin of my arm. Next moment Pollet's hat flew off, with a hole in it. As he peeped round his rock, Durfy had nearly got him. I grinned. 'The traitor has weighed chances and determined to stand by us,' I thought to myself, being, I fear, in a mean mood.

And then came the biggest surprise of that surprising day. A wild 'Coo-ee!' rang out above us—the true yell of the aboriginal—and Durfy rushed into the open, waving his hands and shouting unintelligible words. Yet they were understood; for, with loud yells, a company of a dozen blacks sprang into sight on the hillside and charged down upon Pollet's gang, two of them shooting wildly with revolvers, and the rest brandishing spears and waddies.

I heard a fierce oath, a crack, and turned my amazed face to see Durfy stagger and drop behind his rock. Then, with howls of baffled

rage, what was left of the Pollet gang turned and ran, with the blackfellows and Sandy and Tarrant in hot pursuit.

I sprang to Durfy's side, the mists beginning to clear from my mind. A bullet had gone through his shoulder, and, as I did all I could for him, I said, 'You will pull through all right, my dear fellow. I don't understand all this by a long sight; but I am convinced I ought to beg your pardon. You don't know what hard thoughts I have had of you.'

'Yes, I do.' Durfy smiled faintly. 'I deserved some of them, for my stupid pride made me hold my tongue when a word would have put you right. I can explain.'

'Not now,' I interrupted, pressing his hand. —'Tom, keep an eye on him. I see Sandy coming back, and—— My word! Look at that!'

The rout was complete. Three more bushrangers had gone down, and Pollet was running uphill. As I spoke one of the aboriginals threw his boomerang after the flying figure, and I laughed aloud, for it seemed so just a retribution. The queer weapon hurtled through the air, and just as the villain reached the summit it struck him in the back and sent him flat on his face. But the redoubtable Bobby was made of hard stuff, and as the yelling black sped to finish him, he picked himself up and vanished over the brow of the hill.

We had come off lightly; but the bushrangers had lost four killed and six wounded, four of whom fell into our hands. So, although Bobby Pollet escaped, we had not done so badly, thanks to Durfy's blackfellows; for, as it turned out, we owed their aid to the devotion of one of them to him.

Even now the surprises of the day were not over; for when the blacks returned from their short pursuit they gathered up the wounded at Durfy's command, and we marched through the valley to the spot where we had left our horses. We were descending the slope when Tarrant uttered a shout, and Macneil exclaimed, 'Man! whaever saw the like o' yon?'

Our blackies whooped with delight at our amazed faces, and their cries were echoed by a dozen of their tribe who showed up among the trees where they were guarding not only our horses, but every one of the thirty which had been stolen during the past few months. The blacks, before the fight, had raided Pollet's camp, where, confident in his hiding-place, he had left no guard.

'When you feel up to it, Durfy,' I said, 'there are one or two points which I should like explained; but first I thank you again for the splendid service you have rendered to-day.'

Durfy reddened with pleasure as we all in turn shook his hand, while his faithful blackfellow stood by, grinning from ear to ear. 'The credit is really due to Makomo here. I'll try to explain in a few words,' my late suspect said, smiling at me.

'While at Baraldarong I learned that Pollet was getting a gang together; and Makomo, whom I have known for many years, being in the district, I hunted him up and set him to keep an eye on the bushranger's movements. Makomo was very willing, for he owed Bobby one for cruelty to one of his tribe. It happened that he brought me a report on the night of our arrival at your quarters, and I, knowing that you had sent Foster upon a service of considerable danger, despatched the black upon his trail.

'Foster was captured, but not until he had severely wounded two of the gang, and Makomo came flying across the hills to me with the awful news that the bushrangers intended to revenge themselves by tying him to a tree in the sun.

'I had by that time revealed my identity to you, in order to convince you that I really knew this region, and it was my intention to tell you all that I had learned from Makomo. But your thinly veiled suspicions had angered my pride, and I determined to keep you as long as possible in the dark. Even when I learned of Foster's predicament my pride would not bend, for I knew that you were awake, and had seen the black with me, and I had a shrewd idea of the nature of your suspicions. In self-defence I must say that I knew that no harm could come to Foster until some time after sunrise. Still, had you refused to leave the rendezvous or insisted upon delaying the start, I should have told you all. You believe that?'

'Of course I do,' I said heartily. 'I have as much to own up to and blame myself for as you. I suspected you of being in touch with Pollet, and'——

'So I was, sergeant, though not quite in the way you imagined.' Durfy smiled. 'But I did very wrong; for I lost sight of the fact that Pollet might expect us and lay an ambush, and so I very nearly led you into a death-trap.'

'And my pride made me insist upon following you there,' I returned; 'so let us admit that we were both to blame, and ask forgiveness all round. You have still the best of it; for by instructing Makomo to bring up his blackies you'——

'No, no, don't credit me with that,' Durfy interposed. 'I had no opportunity to give such an order; for when that twig cracked my only thought was to get back to the fire, and it was then I noticed that you were awake. The business on the hill and the recovery of the stolen horses are entirely due to Makomo's generalship.'

'You are a trump, Makomo,' I cried, 'and we will see how many pounds of tobacco you can carry away when you come over to Bildarong.' At which there was a yell of joy from our blackies.

'Levenhall,' I said gravely, 'I think that you ought to resume your own name.' Tears started to the brave fellow's eyes. He knew what I meant. His six years of honest reformation had done much to atone for his past.

I turned to my boys. 'Lads,' I said, 'this shall be a lesson to me not to be wise in my own conceit. I wrongly suspected a good man when a straight question or two would have cleared matters up. My pig-headedness might have cost you your lives. Do you forgive me?'

'Weel, weel,' said Sandy in his quaint way, 'ye 're askin' a guid bit; but we 'll no' lynch ye this time.' Tarrant shook one hand and Durfy the other, Tom Foster smote me on the back, and Makomo and his stalwarts yelled assent.

END OF SECOND STORY.

THE MONTH: SCIENCE AND ARTS.

THE USE OF DYNAMITE IN FARMING.

A FEATURE of modern agricultural science on the North American continent is the utilisation of dynamite for a variety of operations. At first sight it seems somewhat curious that such a powerful and destructive explosive should possess any qualities valuable to the farmer; but as a matter of fact it is developing into his most useful tool. Its most extensive use is in connection with what is called subsoil ploughing, meaning the breaking up of the underlying stratum so that the moisture can force its way into the soil to dissolve the elements of nutrition upon which plant-life flourishes. Ordinary ploughing only treats a comparatively thin layer near the surface, and as this is turned over and over in successive years it is not long before the ground begins to show signs of exhaustion unless stimulated by the aid of fertilisers, and the yield in the crop declines. The subsoil is not touched in the slightest, and being packed hard and firm, it acts practically as a seal. The roots of the crops cannot descend into it, and consequently straggle right and left near the surface, fighting keenly with one another for food. The most economical method of treating the subsoil demanded searching investigation. On a market-garden trenching may be resorted to in order to achieve the desired end, but on a farm of several thousand acres such operations are impracticable. Then it was thought that by charging the ground with dynamite cartridges spaced at certain intervals apart, the whole of the subsoil might be shattered and loosened to a depth of several feet. The experiment was tried, and the results were astonishing. To-day the treatment of the subsoil by dynamite is advocated on every hand by the foremost agricultural authorities, at experimental stations, by railway companies, and by many others interested in the development of the land. Certainly the system is inexpensive and simple. Moreover, it is rendered as safe as science can make a dangerous explosive. A special brand of dynamite suited to the requirements has been evolved; and, with due attention to the elaborate instructions issued as to handling and using it, no fear whatever need be entertained of the tool turning upon the user so long as ordinary intelligence is displayed. A hole is bored into the ground to the requisite depth by means of an auger; the cartridge, with a long length of fuse attached, is slipped in; and the charge is tamped home with a wooden stick, leaving a short length of fuse projecting above the ground. When a large field is being subjected to the treatment the cartridges are planted in continuous rows at such a distance apart that the forces of two adjacent cartridges just overlap, so that the field is treated completely. The fuses are then lighted, and the explosions lift large quantities of earth a few feet into the air, the subsoil for a depth of eight feet or so being shattered and loosened. The farmer then runs his plough over the surface in the usual manner, and completes the cycle of his agricultural operations. Another ingenious application is in the blasting of holes for the planting of fruit and other trees. A spade-dug hole merely loosens the earth within the area of the excavation. The surrounding wall is hard and firm, so that the roots of the tree have great difficulty in forcing their way through the ground, and growth accordingly is stunted for a long time. By blasting, on the other hand, not only is an excellent hole made, but the surrounding earth is disintegrated, so that when the tree is set the roots can push their way into the ground without the slightest effort, and growth starts immediately. It has been proved conclusively that fruit-trees planted in blasted holes grow three times as rapidly as those set in spade-dug holes; they come into bearing sooner, and consequently the orchard comes into profitable yield in a shorter time. Throughout North America farming by dynamite has become well established, and certainly the successes attained in the bumper crops offer conclusive testimony to the value of the method.

A TABLOID COUNTING AND SORTING MACHINE.

This is the age of compressed drugs, and the sale of tabloid medicines of all descriptions runs into hundreds of millions weekly. Naturally special appliances are required for the sorting and packing of the tabloids, and in this direction considerable ingenuity has been displayed. One, of German origin, is particularly interesting, and

has aroused considerable interest in Berlin. The tabloids are poured into a trough-like hopper, which is shut off by a roller of special design whereby the tabloids are carried on to an agitator, a certain number at a time, to be sifted from the powder adhering to them. Finally the tabloids automatically reach a grid, and here the sorting is carried out, all tabloids which are broken or of imperfect shape being discarded. The perfect pellets then pass to the counting mechanism, where the required number of tabloids for a bottle are counted out, and the vessel is filled. By automatic mechanism the counting device stops for a time after a bottle is filled to permit the next empty receptacle to be brought into position to be charged. The machine works with commendable accuracy and certainty, and some idea of its time-saving possibilities may be gathered from the fact that two hundred thousand tabloids can be sorted, counted, and charged into bottles in a seven-hour day.

A SUBSTITUTE FOR INDIA-RUBBER.

Considerable attention has been aroused during the past few weeks by the appearance of a substitute for india-rubber, vulcanite, and leather, under the name of seagumite. It is the discovery of a London chemist, and the fundamental material from which it is made is seaweed. Seeing that this article is so abundant around our coasts, the possibility of being able to turn it to valuable commercial account not only opens up a new industry, but at the same time finds an economic market for what at present is virtually useless. The method of manufacture is a secret; but, judging from the results of the trials to which the new substance has been submitted under arduous everyday conditions, it appears to have a great future in many ramifications of commerce. Seagumite is not only damp-proof, non-inflammable, and germ-proof, but is not affected by heat, cold, oils, or exposure to weather. It can be made as tough as desired, and consequently is an excellent substitute for vulcanite. To the electrical trade this is of far-reaching importance, as it brings into vogue a new and cheaper medium said to possess all the insulating properties of india-rubber, from which vulcanite is prepared. A series of tests were carried out with this composition at the Westminster testing laboratories, and it was found capable of withstanding a test of thirty-two thousand volts. As a packing material in steam-engines it has proved highly serviceable, and stands the work excellently; while the fact that it withstands the action of chemicals and acids extends its sphere of usefulness still more. It can be used for the manufacture of motor-tires just as easily; it is as resilient as rubber, and costs about 30 per cent. less than the rubber tire. Boots and shoes can be made from it; and not only is the footgear lasting and hygienic, but its damp-resisting quality is its most attractive feature. Compared with leather, boots can be made of seagumite for about half the price. Wherever leather or vulcanite is used, seagumite is equally applicable, and for the most part with far better results. It is practically unbreakable, is almost imperishable, and completely fireproof, the blast of a gas blow-pipe only slightly charring the surface. A factory is being erected for the manufacture of this substitute, with an output of six tons per week at first; but should the anticipations of those concerned in the exploitation of this discovery be fulfilled, and the material prove equal to the article which it is devised to displace, the output will have to be increased very considerably, as a heavy demand is certain to ensue. Indeed, already the various industries to which the substance makes appeal are displaying practical interest in the development.

A HOUSEHOLD BUTTER-MAKING MACHINE.

Every housewife's ambition is to be economical and yet practical, so that any device which combines these two factors to advantage is certain to provoke deep interest. At the present moment the price of butter is occasioning considerable anxiety. To be able to make two pounds of butter at home for little more than the cost of one bought at a shop, or rather to be able to turn the purchased pound into two pounds, seems somewhat magical, but it is nevertheless an accomplished fact. A machine has been contrived whereby this can be achieved. It is a small device which a child can work, and there is nothing to get out of order. The process is very simple. One pound of pure butter is required. This is cut into small pieces, so as to fit in between dashers within the machine. To this is added three-quarters of a pint of milk, with a small teaspoonful of salt. The annular space surrounding the inner vessel is now three-parts filled with hot—not boiling—water, the lid is attached and fixed, and the projecting handle is moved forward and backward slowly until the butter softens; then it is turned to the right freely for about two minutes, when the butter is formed. The contents, consisting of about two pounds of milk-blended butter, are then poured out and permitted to cool. It is an excellent device, and the milk-blended product which is obtained is particularly appetising. The machine certainly solves a critical problem in the home by enabling a costly commodity to go farther than is otherwise possible, and this, where families are concerned, is no mean achievement.

ELECTROLYTIC BLEACHING.

Electricity has been described as mankind's greatest handmaid, and when one observes the rapidly increasing application of this science to every branch of industry the fact cannot be disputed. One of the latest developments is the utilisation of electricity for bleaching purposes.

Under the old régime, when stained linen was sent to the laundry the general method of removing the disfigurements was by means of a bleaching agent such as chloride of lime. This chemical achieves its work excellently, but it plays sad havoc with the textile. Some twenty years ago a firm in Russian Poland endeavoured to harness electricity for this work, and they succeeded beyond all expectations. The electric current is used to produce a bleaching medium from salt water, producing sodium hypochlorite, which is neither alkaline nor acid in character. From this small beginning the new system has developed on every hand. It is used in many of the largest textile-mills, and is almost universally employed in one of the youngest industries —the manufacture of artificial silk. Wools and cottons are treated therewith, the system being preferable to that formerly practised. It promises to revolutionise the laundry completely, owing to its simplicity, efficiency, and low cost of operation. A large installation has been laid down at the Rudolf Virchow Hospital in Berlin for treating all the clothes and linen used in that establishment. Not only does it restore the garments to their pristine whiteness, but it at the same time brings about complete sterilisation, as the electrolytic bleach is a powerful germicide. The apparatus is made in a variety of forms to suit any and all requirements, so that the small laundry is brought into line with its bigger rival. Recently its application has received a fresh impetus, inasmuch as the German chemists have found that woollen hosiery treated with a weak solution is rendered unshrinkable. The system is meeting with increasing favour in this country, and in America it has leaped into a prominent position in a very short period, as within two years it was adopted in one hundred and fifty laundries. Apart from mere laundry purposes, the electrolyser can be used for the manufacture of a disinfectant, if desired, for flushing drains and pavements, washing floors, and so on. It destroys bacteria and the germs of phthisis, cholera, typhus, anthrax, and other fearful maladies, while it has the great advantage of being non-poisonous.

A COLLAR TIE-GRIP.

What mere man has not at some time or other declaimed against the persistence of his tie in rising up his collar at the back. Numerous devices have been patented to avoid this uncomfortable drawback, but none has met the difficulty so neatly as that which the writer saw recently. This clip slips under the collar in the proximity of the back-stud, and the tie itself slips to and fro within two notches. It cannot rise and it cannot move from its position. The advantage of such a device will be more readily appreciated by those accustomed to wear soft shirts, with which the tie and collar troubles are legion.

WOODEN SHOES.

According to a report from Vice-Consul D. P. de Young at Amsterdam, Holland exports more wooden shoes to the United States than to any other country. Many hundreds of pairs are now worn in Michigan, Iowa, Missouri, New Jersey, and other states. The remarkable statement is made that there is more wooden footgear worn in Chicago, Grand Rapids, or Holland (Mich.) than in the city of Amsterdam. Other places importing this practical article of dress extensively are Paterson (N.J.), St Louis (Mo.), Lancaster County (Neb.), and Marion County (Iowa). The shoes exported from the Netherlands are mostly made in large factories by modern machinery. On the contrary, the wooden shoes worn in that country are generally hewn to the measure of the customers' feet in the village shoe-shops, and the local price varies according to the amount of wood used and the market price of the raw material.

To Correspondents who wish fuller information regarding new inventions mentioned here, addresses will be furnished, when possible, provided a stamped and addressed envelope or post-card be sent to the Editor, 339 High Street, Edinburgh.

SUNLIGHT.

THOUGH about me lay the sunlight, and I bore no cramping load,
And the way was smooth and pleasant for my feet,
Yet my heart were heavy going for those others on the road
Who went bare and stripped of any hour of sweet.

Though the birds sang ever near me, and but music reached mine ear
In majestic symphonies of land and sea,
Yet my soul were very pitiful for others passing near
Deaf to all the melodies life gave to me.

Though calm, ordered peace and comfort shed their lustre on my lot,
Nor care nor sorrow marred my life's design,
Yet I still were sick and sad for all those others who had not
A tithe of these rich blessings that were mine.

MARY M. CURCHOD (MYRA).

*** TO CONTRIBUTORS.

1*st*. All communications should be addressed 'To the Editor, 339 High Street, Edinburgh.'

2*nd*. For its return in case of ineligibility, postage-stamps should accompany every manuscript.

3*rd*. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, *should have the writer's Name and Address written upon them* IN FULL.

4*th*. Poetical contributions should invariably be accompanied by a stamped and directed envelope.

CARLOTTA.

By HOWARD C. BOYES.

PART I.

WHO knows? The house may still survive on the outskirts of Toledo—and the blood-stains yet linger on the wall, which looks across the fragments of that greater one which Wamba built to the turgid waters of the Tagus, and beyond to the green fields and dust-gray road which leads to Aranjuez and Madrid.

For all years it was an unfortunate house; misfortune dogged it, as it dogs the lives of some men; and, even as their faces become soured and grim, its walls took unto themselves a sere yellow that no ravages of time could have painted. Muleteers and countryfolk passing it at nightfall would either swagger truculently by, their right hands resting on the handles of their knives, or else reverently cross themselves and appeal to their patron saint to protect them past the unhallowed place. For the native of Spain is superstitious, and shows his credulity in many varied ways, according to his nature.

It was in June 1838, a year of grave moment to Spain, when for a while the throne of Isabella hung in the scale, and against the loyalty of the army there weighed the lazy passion of the people, who—tired of a girl upon the throne, wearied of the regent who had been their late monarch's fourth wife—needed but a great man to arise and lead for them to throw off the lethargy beneath which they had suffered for a century. Had Don Carlos been a soldier—nay, even a man—Spanish history would have been altered. As it was, many hearts were broken, many lives lost.

The day was warm; a scorching sun poured relentlessly down upon the fields and on the cobbled roads. It was noon, the hour of siesta, and a solitary horseman, riding across the bridge of Alcantara, passed by shuttered houses as he turned towards the great square known as the Zocodover.

In the Arco de la Sangre he stopped to inquire the way of an orange-woman seated in a shady spot, her back against the wall of the inn immortalised by associations with Cervantes.

She was short and fat; the grace of the Catalonian was not hers, thought the rider. Her eyes were half-closed; a general air of ennui pervaded her whole person.

Slowly she opened her eyes as a sleepy child might when his horse stopped beside her. '*El Nido*,' she said—'*El Nido!* you travel there;' and the heavy ear-rings she wore shook in her astonishment.

'And why not?' queried the rider with a smile. The smile was a winning one, and it awoke Teresa, the seller of oranges, from her somnolence, and it gratified her, for Teresa had once been young and comely, and though the years had not dealt kindly with her, yet her pride was as great as in the days when she was the much-sought-after *bella* of Toledo. Her dark eyes flashed. 'Because, señor,' she said vehemently, 'it is an evil house; there are bad stories concerning it.'

The rider smiled. 'Ah,' he answered, 'an eagle's nest! And yet I hear it contains two dainty eaglets, pretty birds that would not harm a flower, much less a human being.'

'But yes,' said Teresa, 'the Señoritas Carlotta and Anita.'

'Then,' said the rider, 'I will throw myself upon their mercy. Am I right for *El Nido*, this dangerous nest?'

'But no,' said the woman. She rose and with a fat forefinger pointed the way he should have gone. It lay along a road cut out of the cliff upon which Toledo stands, and rising to the heights beyond. On the summit stood a lonely house.

'That,' she said, 'is *El Nido*.'

'A fitting path to such a dangerous residence!' The rider wheeled his horse round, and, with a ready smile and bow, raised his hat and rode away.

Teresa watched him. 'Ah,' she said, 'he is *un Inglis!* They fear nothing.' Then she returned to her corner amidst the shadow, and fell asleep, to dream of an Englishman who had once entered into her life, long years before, when she was La Bella Teresa. The picture he had painted then still hung in her little attic, amidst the faded finery of a bygone day, kept in remembrance of past triumphs, for the Spanish woman is romantic, and Teresa was a true Spaniard.

It spoke much for O'Hara's nature that before he had ridden a hundred yards up the path

 [*All Rights Reserved.*]

which led to *El Nido* the warning of Teresa had passed for ever out of his mind. He was a Celt, born of a Welsh mother and an Irish father, and he possessed all the full-blooded recklessness of the Celts, their warm-heartedness and impetuosity. Moreover, he had served in the regent Christina's army for nine months, an experience which had taught him many things.

El Nido, standing upon its rocky eminence, was exposed to all the four winds and to the overpowering glare of the Spanish sun. From its windows it looked down upon the Tagus, hundreds of feet beneath.

'Such a house should have a history,' thought O'Hara as he rode into the *patio*.

Dismounting, he pulled at the bell. For a few moments there was no reply; then the swish of soft skirts sounded upon his ear, and before him stood a tall, dark girl, with lustrous eyes and the grace that is only given to women of Spain. Her dress of soft silk clung around her figure, displaying its perfect symmetry.

Instantly O'Hara's hat was raised. 'The Señor Carrillo?' he asked.

'But yes,' answered the girl. She glanced at his clothes, and saw that he wore the uniform of Spain, although his speech betokened a foreigner.

'I have a letter of introduction to him from an old friend of his in Madrid.'

'You will come inside?' said the girl. 'Father is asleep—it is the siesta; but I will soon wake him.'

'Please don't do that,' replied O'Hara. 'I can wait until he has awakened.'

The girl smiled. Perhaps she read the thoughts passing through his mind—that he would have half-an-hour alone with her.

He was holding the bridle of his horse. She held out her hand towards it. 'You would like it stabled.—Pedro!'

A few seconds, and a rough-looking youth emerged from the gardens. He was destitute of a coat, displaying a pair of lean brown arms and a gaudy crimson shirt. On his head was a dusty straw sombrero, stained brown with the glare of many suns.

'You will take this señor's horse and give it food.'

'And a rub down,' said O'Hara.

'And a rub down,' repeated the girl with an engaging smile.

The youth nodded and led the animal away. 'Yes, señorita,' he said.

The girl ushered O'Hara into a room overlooking the gardens of *El Nido*. The blinds were drawn, and a sense of coolness pervaded the atmosphere.

'What a haven of rest for a weary traveller!' he said.

'You have travelled far, señor?'

'From Madrid, and the sun is hot.'

'You are not a Spaniard,' said the girl with a smile.

'No, señorita. I come from England.'

'I knew as much.'

'My pronunciation—I fear it is shocking!' said O'Hara.

'Partly, and the daring way you ride, travelling during the heat of the day. No Spaniard would do that. They are either too cowardly or too lazy.'

'And yet you are a Spaniard.'

'Yes, señor, and I would not travel at midday.'

O'Hara glanced at her. 'You are the Señorita Carrillo—the Señorita Anita Carrillo?'

'No,' she answered; 'I am Señorita Carlotta Carrillo. And so you know our names?'

'Yes, señorita. I come from a very old friend of your father's in Madrid, Señor Loria.'

'Ah, father often speaks of him! I met him once.' The señorita made a little *moue*. 'I do not like him, he is so stern.'

'He is a soldier,' answered O'Hara.

'You are a soldier, and you are not stern.'

O'Hara bowed graciously. 'Your retort is unanswerable. I could not be serious if I tried.'

'No,' responded the señorita, surveying him critically. 'I do not believe you could.'

For nearly an hour they chatted together on many subjects; then a step sounded in the passage, and a man's voice, 'Carlotta! Carlotta!'

The girl rose and hurried to the door. For a moment O'Hara heard her speaking to Señor Carrillo, telling him who he was. Then they entered together.

'Señor O'Hara—my father,' said the señorita, with the air of a grande dame and a mocking smile which belied the grandeur of her action.

'Carlotta, my child!' said the señor. Then he advanced to greet O'Hara. 'Any friend of my friend Señor Loria is welcome at my house,' he said.

O'Hara bowed and handed him the letter of introduction. Señor Carrillo read it through. 'And you are doubly welcome since you are a soldier in her gracious Majesty's army. You are staying in Toledo? Pray consider my house at your disposal.'

O'Hara demurred.

'I insist. I would not have you think badly of Toledo. The hotels here are'—he glanced in the direction of his daughter, then added in a whisper—'are infernal. That's a good word you English have; in Spain we possess no equivalent.'

O'Hara was about to make some light rejoinder when the door opened and a second Carlotta entered.

Señor Carrillo saw him glance from one to the other. 'My second daughter, Anita,' he said.

O'Hara bowed.

'We are twins,' said Carlotta; 'but I am the elder by five minutes—or is it four?' she added, addressing her father

'Four, I believe,' replied the señor with mock solemnity. He turned to O'Hara. 'You must be hungry after your long ride.—Carlotta, you should have had some wine and food brought in.'

'I will go now.—Señor, a thousand pardons!' said Carlotta.

Señor Carrillo watched her leave the room. 'She is a sad handful,' he said. 'I am glad her sister does not resemble her as closely in that as in other ways.' He glanced at the Señorita Anita and smiled indulgently.

Gradually, as O'Hara lingered in Toledo—and he was in no hurry for his duties to call him from it—he learned the difference between the two sisters, so alike that a stranger could not have distinguished one from the other.

While they were waiting for refreshment, Señor Carrillo plied him with questions regarding Madrid and his friend Señor Loria.

'There will be fighting in Madrid yet,' he said.

'I doubt it, señor,' replied O'Hara. 'Don Carlos's men are too irregularly paid. It is treachery we shall fight against, not against an army of men, although many would prefer it so.'

'You, my friend, for one,' said Señor Carrillo, with a grave little smile. He was a good judge of men.

'I come of a fighting race,' said O'Hara.

'We fight in Spain,' replied the señor; 'we are born fighters, but we fight in the dark, and it spoils a man's nerves.'

'It does,' replied O'Hara, as the food was brought into the room.

'I have ordered a room to be prepared for you,' said the señor during the meal; 'you would like to rest after your long journey?'

O'Hara drew out his watch. 'In half-an-hour I am due to visit General Gomez.'

The señor nodded. 'It is well to be punctual—when you can. You do not find it is easy here, eh? Time is a commodity which the Spaniard does not value.'

Twenty minutes later O'Hara rose.

'You will want your horse,' said the Señorita Carlotta. 'I will come with you and show you where the stable is.'

She led the way out of the balcony, and from there through a tangled wilderness of garden to some whitewashed outhouses at the rear of *El Nido*. 'Pedro!' she called. Pedro appeared. 'You will saddle the señor's horse and bring it round to the *patio*, and you will please hurry.'

'Whilst we are waiting,' she said to O'Hara, 'I will show you the wilderness father is pleased to call the garden, if you would like to see it.'

'I should be delighted,' replied O'Hara.

She took him along a gravelled path, between rows of flowers, past a softly splashing fountain, past terraces of grass, leading downwards, to all appearance, to the abyss beneath. Suddenly she stopped. 'There!' she said dramatically, and with arm outstretched pointed before them.

Sheer down beneath lay the cliff; a slip of the foot meant a fall of hundreds of feet into the Tagus below, which flowed into the distance like a yellow silken band. A couple of muleteers passing across the bridge of Alcantara appeared to them as dwarfs. In the distance as far as eye could see stretched fields and the white, dusty, sun-baked road which led to Madrid.

'What a magnificent view!' said O'Hara.

'Isn't it glorious?' said the girl, her eyes shining, while the cool wind which had arisen brought a rich colour to her cheeks.

'And you are the queen of the castle!' said O'Hara. He was gazing at her as she stood by his side.

For a second their glances met and a deeper colour suffused her cheeks.

'We will turn back, señor,' she said. 'Your horse will be saddled now, and you will be late in your appointment with General Gomez.'

As she stood in the sunlight Carlotta looked the queen O'Hara had called her, and the sight of her sent the blood coursing madly through his veins. Passionate words rose to his lips, but he denied them utterance.

'As you will, señorita,' he replied. He smiled into her face. 'I have learned a lesson to-day up here upon this slope. Duty does not always go hand-in-hand with pleasure.'

'And you have only learned it to-day—you, a soldier!' answered the girl.

He answered nothing, and they walked in silence to the *patio*, where she watched him mount his horse and ride away.

His mind was occupied with many subjects as he rode down the rocky path into the city itself, through the Zocodover, from which Teresa had vanished, to the barracks. There General Gomez awaited him in his private room. He was a tall, thin Spaniard, with dark, piercing eyes and sunken cheek-bones, accentuated by his iron-gray beard. He bowed and motioned O'Hara to a chair.

'I am afraid I am late,' said the Englishman; 'but I only arrived in Toledo a couple of hours ago, and the journey from Madrid is tiring.' His face had grown serious since he entered the room. The smile had quitted his lips; he was a soldier, standing before a soldier, his superior.

'It is a pity you dislike the journey,' said General Gomez, 'for you will have to make it many times within the next few weeks.'

'In the hours of evening when it is dark—

and cool,' said O'Hara; 'I shall not mind then.'

'Yes,' assented the General, 'it will be pleasanter—and more dangerous.'

For over an hour he sat in close conversation with his chief, one of the three great generals in Spain, upon whom many averred the Queen's life depended. When he left it was as special aide-de-camp to General Gomez.

The General was not one given to making compliments. When he held out his hand at the termination of the interview he paid one of the few of his life. 'You came to us with a great reputation,' he said. 'You have won golden opinions in Madrid. I shall expect great things of you.'

'I shall do my best,' answered O'Hara.

'And no man can do more,' said the General gravely.

(To be continued.)

ASPECTS OF LATIN-AMERICAN REVOLUTIONS.

THE writer of the following lines has lived nearly a quarter of a century in various Latin-American republics. He has witnessed many revolutions, and the following details are the record of personal experience. The spirit of revolution seems to run in the blood of the Latin race, for revolutions are not confined to South or Central America. The recent overthrow of the Portuguese monarchy is a case in point; while few revolutions have been more sanguinary or terrible than that which in France commenced by the capture and demolition of the Bastille in 1789. Personal ambition, political intrigues, love of excitement—these are the principal factors which produce revolutions. It is comparatively seldom that they arise from a real desire of the mass of the people to free themselves from oppression, though this is often the alleged motive of the rising. 'Death to the tyrants!' is a good catchword, which never fails to secure many adherents; but how often has it not been the case that the rebels, once successful in overthrowing their opponents, have proved more tyrannical than their predecessors, and have inaugurated a real reign of terror! This was the case with the first French Revolution, and the same result has been repeated in many of the revolutions which have disgraced the smaller Latin-American republics.

Here are some aspects of a South American revolution. The Dictator Rosas was condemned to death in 1861 by the Argentine Congress as a 'professional murderer and robber,' two thousand and thirty-four assassinations carried out by his orders being specified. The actual number must have been much greater, for as early as 1843 one of his chief opponents published a detailed list of twenty-two thousand four hundred and five victims of his savagery. Rosas escaped to England, where he lived in constant fear of assassination until his death in 1877.

Possibly this beats the record of the Dictator Lopez of Paraguay. The writer has seen a list of the persons he ordered to be executed (mostly on the charge of 'treason') during a period of six months only, but cannot remember the exact number. However, a mere list of the names, closely packed, in small print, filled the entire page of a newspaper of ordinary size.

On the outbreak of a revolution, or even when a revolution is threatened, the first act of the Government in power is generally to proclaim martial law, or 'state of siege,' as it is called in South America. This is a far-reaching measure, with important results to all residents in the affected country. The constitutions of the various Latin-American republics are as a rule extremely liberal; they guarantee the utmost liberty of conscience, liberty of the press, and liberty of nearly everything else to the intending immigrant, and do not hesitate to publish the fact. As soon as martial law is proclaimed all these guarantees are suspended; the people live under a dictatorship, and the Government do simply what they please. Woe betide the unhappy editor who happens to oppose them! He is lucky if he is subjected to no heavier punishment than banishment or imprisonment and the suppression of his paper. Unfavourable criticism of the Government may even be a capital offence. The Buenos Ayres *Standard* of 28th March 1911 records the case of two Argentine journalists who were condemned to death under such circumstances during a revolution in a neighbouring republic. It relates many other atrocities committed at the same time, such as the cutting of the throats of wounded men on the field of battle, the shooting of political prisoners without trial of any kind, and many other incidents of the same kind which are not uncommon during South American revolutions. The paper referred to is the principal English organ published in South America; it is the *doyen* of the Buenos Ayres press, well known for its impartiality and fearlessness, and has lived up to its motto of *Nil falsi audeam, nil veri non audeam dicere.* But other Buenos Ayres papers were even louder in their denunciations of the atrocities committed, and advocated foreign intervention to prevent them.

If atrocities half as bad had been committed by the Turks, the British press would have been loud in its condemnation and calls for redress. The same public that was roused to indignation over the reports of the

Bulgarian atrocities views with indifference the atrocities which are continually committed during the revolutions in these small republics. It is not the object of the writer to produce sensational 'copy;' but if the atrocities and abuses indicated in the present article lead to a thorough and impartial investigation of the state of affairs described, and cause it to be held up to the judgment of the civilised world, he believes a step will be taken in the right direction.

Revolutions are of all kinds and degrees. Some of them are comparatively harmless, and scarcely productive of greater loss and inconvenience than an ordinary British strike; many persons whose only experience of a revolution has been one of this kind are apt to think that all are equally harmless.

Even neutral foreigners who take no part in the movement are not allowed to escape unmolested. It frequently happens that their horses, cattle, arms, accoutrements, and any other property that may be of use are seized, generally without compensation of any kind, either by the Government or the insurgents. To give a case in point which not long since came to the writer's notice. Two horse-dealers (peaceable foreigners) were on the road with a troop of horses when a revolution broke out. All the horses, about one hundred and fifty (their entire fortune), were forcibly seized without compensation, and they were compelled to make their way on foot to the nearest town, which was a considerable distance away. Before arriving there they were again set on by a band of marauders, who relieved them of their small arms and loose cash, leaving them absolutely penniless. But cases of this nature are common.

Worse than this often happens. Even in times of peace there is little security for life and property in the remote country districts. One of the first acts of both parties when a revolution breaks out is to secure as many 'volunteers' as possible to aid their cause. These volunteers are often rounded up like so many cattle and tied with a rope or lasso to prevent their escape. So well is this known that as soon as a revolution begins the first act of the peasants and lower classes in general is to take to the woods to prevent their being impressed to fight for a cause to which they may actually be opposed. Even foreigners are not always spared if they cannot produce documents to prove their nationality. The consequence is that the remoter parts of the country are soon filled with desperate characters ready for any deed of violence. Bands of these marauders attack isolated farmhouses, stealing horses and cattle or anything else they may require. Women are outraged and murders committed with complete impunity.

The defenceless position of the country population is further aggravated by the fact that the party which has locally the upper hand generally searches all the houses for arms, thus leaving the outlying settlers without means of defence just at the time when such defence is most necessary. Journalists who venture to denounce this state of affairs are often roughly handled. Independent parties who try to collect evidence are punished as spies. At least in one instance soldiers who committed wholesale murders and other outrages were bound to secrecy under the most fearful oaths. No wonder, then, that there is great difficulty in getting at the real facts, and that little leaks through to the European press.

Even at the moment when the writer was engaged in penning this article he received notice of another revolution in Paraguay (the second in six months). As this revolution and the events which led up to it are typical of such events in South America, the following account, which is taken from a local paper, *El Tiempo*, of Asuncion will prove interesting. Not long before, the proprietor of another paper, *El Diario*, who had taken a prominent part in opposing the dictator, was shot without trial. As some documents of a very incriminating nature (relating to an unsavoury scandal in which the Dictator Jara was mixed up) came into the possession of the *Diario*, the editor, the press censorship having meanwhile been somewhat relaxed, ventured to have them photo-lithographed with a view to their publication. This came to the ears of the tyrant, who sent a squad of soldiers to arrest the editor and wreck the printing-office. Some of the officials were imprisoned and others deported, among the latter being several foreigners who occupied a subordinate position on the staff, and were in no way responsible for what had happened.

This infraction of the liberty of the press caused much indignation among the more intelligent part of the population, and the students of Asuncion were the first to make a practical demonstration of the fact. They paraded the streets, demanding perfect freedom of the press, as guaranteed by the constitution. Their leaders were arrested and severely flogged by the orders of the dictator.

Matters had already become so insupportable that Congress was compelled to act. When the matter came up for discussion it was found that the opponents of the Dictator Jara were in the majority, and affairs commenced to look serious. But the tyrant was not to be balked by such a trifle. All the opposing members were arrested, sent to prison, and forcibly compelled to resign. Next day the minority, comprising Jara's adherents, assembled and accepted the 'resignation' of their colleagues.

An attempt was also made to take proceedings against the persons who had wrecked the offices of the *Diario*, though it was known this was done by Jara's orders. The judge (a man of recognised probity) who was to try the offenders

was also imprisoned and forcibly compelled to resign. The other judges then protested in a body against this act of violence. The only answer they received was that they would be treated in the same way if they did not prove sufficiently complacent. The whole situation had become intolerable. But Jara, though detested by all parties, still maintained his position, as he had the army at his back, and relied on bayonets for his support. But now even the army, on which he depended, rose against him, and he was hastily deposed by a sudden *coup* of his own supporters. Perhaps it may be supposed that his deposition was due to the virtuous indignation of an outraged people. Nothing of the kind! One intriguer had deposed another; the country was still at the time this article was written under the heel of military despotism.

This latest revolution had the advantage of being bloodless, and the present head of the Government will probably be warned by the excesses of his predecessor to be more prudent in his actions. Only so far is there a slight improvement.

Can nothing be done to remedy this state of affairs in general? The physician who diagnoses a disease does little good unless he can also prescribe a remedy. And that such a remedy is practicable is the writer's firm conviction. We live in an atmosphere of international peace-making and arbitration; every year the action of peace societies and tribunals of international arbitration becomes more pronounced. But tribunals of arbitration, such as that of The Hague, seem to confine their operations to international disputes; civil war and revolutions do not enter into their scope. Yet civil war is one of the most dreadful forms of war, and a revolution often adds to the horrors of war all the horrors of anarchy.

Though we have peace societies in abundance, the writer is not aware that any of these has taken a pronounced part in the settlement of revolutions or civil war. A society for the suppression of revolutions is quite as necessary as one for the suppression of international strife. It is to be hoped that such a society will be established, or that a tribunal such as that of The Hague will broaden the scope of its operations so as to include civil war and revolutions. What the writer suggests is that such a society should have an accredited agent in the capital of every Latin-American country, empowered to offer his services as mediator between the contending parties; to publish in the European press an account of the revolution and the causes which led to it; to denounce any atrocities which may be committed, and to collect evidence in regard to them; in short, to do anything which may tend to prevent revolutions or mitigate their effects. He would, in fact, be what might be called a 'revolution missionary.'

As an alternative, the foreign consuls or diplomatic agents at every Latin-American capital might form themselves into local peace committees, under the direction of their local *doyen*, acting, if possible, under the auspices of The Hague International Tribunal of Arbitration, with full power to mediate. In such a case it would, of course, be necessary to obtain the consent of their respective Governments, as well as that of the Government to which they are accredited. As there is no party more interested in the suppression of revolutions than the Latin-American Governments themselves, it is presumed that their consent would be obtained without difficulty. The above suggestion is a mere outline, which may be amplified or improved. It is possible that other and better remedies may exist, but only by suggestion and discussion can practical results be obtained.

As revolutions are generally sudden and unexpected in their outbreak, it is necessary that they should be dealt with in the first place by persons on the spot. A tribunal such as that of The Hague, several thousand miles distant, could not act with sufficient promptitude. Nevertheless it could assume the supreme direction, giving a final decision on all questions that might arise, whether of an internal or international nature.

At a banquet given not long ago by the New York Press Club, Mr Carnegie asked for suggestions as to the application of the large peace fund which owes its existence mainly to his philanthropy and generosity. The present writer begs to suggest that a portion of it might be applied, in the manner suggested above, for the suppression of civil war, revolution, and anarchy. In an article like the present it is impossible to go into further details.

So far the writer has only looked at the matter from the humanitarian side. But much could also be said from the practical or financial side. The amount of British capital invested in the countries of Latin-America is very great; *Hazell's Annual* for 1911 estimates it at nearly five hundred million pounds for Argentina alone. This may be a sanguine estimate, but probably it will be on the safe side to estimate the British capital invested in the whole of Latin-America at one thousand million pounds, or considerably more than the amount of the British National Debt. But while the National Debt is a liability on which the British taxpayer has to pay an interest of many millions annually, the investments aforesaid are a valuable asset which brings in a large return. Anything which tends to prevent revolutions and guarantee peace tends at the same time to increase the capital value of this asset and the dividends received from it, while revolutions have the opposite tendency.

It may be noticed that revolutions, unlike great wars, show no tendency to diminish in

frequency—rather the reverse. At the moment of writing the revolution in Mexico is just over; another, on a small scale, is raging in Matto Grosso; another is threatened in Rio Grande do Sul (Brazil); and the papers announce that Castro is preparing another *coup* for Venezuela. There may be others, for the European press scarcely takes notice of the revolutions in the smaller republics.

Perhaps it will be said that the above statements are overdrawn. The writer hopes that a society for the suppression of revolutions will be formed, and he suggests that one of its first acts should be to send out agents to collect evidence as to the atrocities committed during South American revolutions; there is ample material. Private persons who try to obtain evidence are sometimes expelled from the country. In the case of persons locally established, banishment may mean complete ruin; but such a punishment will have no terrors for the travelling agent. Perhaps by some such method the conscience of the civilised world will at last be awakened, and something done to remedy the evils briefly recapitulated in the present article.

THE CAHUSAC MYSTERY.

By K. and Hesketh Prichard, Authors of *Roving Hearts*, *Don Q*, *Tammer's Duel*, &c.

CHAPTER XXV.—THE SINS OF 'ASTORETH.'

THE influence of the day and of the woman lay strong upon Puyfot. Half-reclined in a deep chair, he waited in Lady Madesson's drawing-room for her appearance. The hot, languorous summer afternoon, with its hushed noises, crooned an exquisite song of love and glory in his ears.

Under the pink-and-white awning of the balcony a forest of flowers level with his eyes recalled to him forgotten days of his childhood, when he lay in Southern meadows, his sight filled with the delicate waving of bloom and grasses, overhead the burnished sky, and in his bosom a newly awakened soul. He had believed those exquisite days gone for ever, but he had found them again, crowned with a fuller ecstasy, inweaved with love, edged with a delirious happiness. He was stirred, softened, humbled, exalted. The mad mood of his kind was upon him. To-day—yes, to-day, in that luxurious, scented stillness—he would tell her, his queen, his inspiration, that he loved her. He forgot the fact that, however bold were the heights to which his imagination soared when out of her presence, the moment he entered it she held him unalterably to his true position. Towards him she was a queen, condescending indeed, but cold, seeing him not as a man but as a subject gifted with a glorious genius, but separated from her by unbridgeable distances. So it was now; but in the future, when the world acclaimed him, surely he must rise to her side, or would she stoop to his?

Upstairs, Lorrie Madesson on her knees asked for forgiveness not from Heaven only, but from earth. Once Puyfot's admiration would have seemed to her no more than a not unamusing episode; to-day she almost loathed herself for having awakened it. She was well aware that Malcolm, if he had loved her, would rather have died than consented to her interviews with Puyfot, who, under cover of quotations from *Astoreth*, raved out his love for herself. Further, although Malcolm did not love her, he held her too sacred to permit her the stain of that companionship. Could she ever confess to him that she had stooped to win this vile creature's love, to tamper with such loyalty as still starved in him, to absorb his vain soul in nobler dreams, that she might use him for her own purposes? Detching knew of it all without horror or even objection; and yet, as Lorrie well understood, Detching loved her. Detching was a man who could love a woman, not in spite of her faults, but perhaps because of them. Malcolm was far otherwise. She recalled the look upon his face when he spoke of Alice Lanceley. The girl's ignorance of life, her empty experience, even her nebulous affection, were in his eyes the adorable attributes of a saint. And for these very scruples, alas! Lorrie loved him.

That was Lorrie's dark hour. But she soared above it, for she resolved, come what might of misunderstanding in consequence of it between her and Malcolm, to carry through her design as regarded Puyfot; to sacrifice herself if only she might by any means gain for the man she loved the knowledge that would give him back his career and the joy of life. She rose from her knees and spent a moment at her glass adding touches of fascination to her appearance, yet could hardly force herself at the last moment to enter the room that held Puyfot. It may be that he did not hear her enter, for he remained sunk in his arm-chair. Lorrie moved softly, looking at him, the little human weed whose presence marred the beauty of her flowers.

'M. Puyfot!' He got upon his feet slowly, like one dazed. 'No, please don't move; it is much too hot for ceremony,' she went on, dexterously avoiding his hand. 'Sit down. I have good news for you.'

Puyfot had reached a chair at no great distance

from her by this time. 'Madame,' he breathed, 'we are, then, immortal!'

'Not quite yet, but on the way perhaps.' Lorrie smiled. '*Astoreth* will shortly go into rehearsal both here and in Paris.' She went on into various details, but he scarcely heard her. As usual, her very presence intoxicated him. When she had ceased, he was silent for a moment, with his eyes fixed upon her. That silence was meant to be the fitting prelude to his great love-scene.

'Madame, I owe you everything!' He hesitated, and, instead of the word he longed to use, he uttered another. 'Gratitude in the breast of men of my race is not a common emotion; it is a passion! I could have offered you that, beautiful lady, and embalmed your name in verse worthy of us both. But for you is reserved a greater destiny.'

Lorrie underread the poetic pomposity. She foresaw what was coming, and, holding down her disgust and repulsion, met the words with a faint smile that never failed to act as a check upon his attempted protestations.

'We were talking of something more immediately important than my destiny,' she said after a little interval, during which he felt an embarrassment he fought against without success —'of *Astoreth*.'

'To another man *Astoreth* might appeal at such a moment as this, but not to me.' He rose, making another effort to force her to hear that which he desired to tell her. 'The supreme fact of existence to me, even to-day, is that I may kneel to you with immortality in my hands. Upon your head I would place my crown of laurels.'

The faint smile deepened at the corners of her mouth. 'Let me remind you that this is a moment of gratitude, of generous impulse,' she said.

'You are at all times my inspiration, my'——

'We will talk of this another day,' she said with a firmness of tone which jarred upon him and spoilt his eloquence. He secretly deplored the fact that the Anglo-Saxon races are lacking in the dramatic instinct. One of his own countrywomen would have been in sympathy with the perfection of such a declaration at such a juncture.

Meanwhile Lorrie and her adorable smile held command of the situation.

'Madame,' he said, after a half-sulky pause, 'you are cruel to-day.'

She shrugged her shoulders gaily. 'What does to-day matter if to-morrow gives *Astoreth* to the world?'

A wild idea sprang into his mind. He understood her now. This magnificent woman whom he loved was jealous of *Astoreth*—of the child of his brain. He smiled at her ecstatically.

'To-day is flesh and blood,' he exclaimed with meaning, 'and dearer far than to-morrow to me!'

She seized at once upon his fatuous mistake, and twisted it to further her own purposes. 'That is beyond belief,' she said in a very low voice. 'Men pretend to give all, but withhold much.'

Puyfot was fast losing his head. Never before had she so far unbent to him. He rose and stood at her side.

'How can I prove'——

She interrupted him, waving him imperiously back to his chair. 'I cannot speak while you stand there.' Then she added, 'You refused me a request I made.'

He looked at her with blank astonishment. 'But impossible! I could not refuse you any request.'

Lady Madesson shook her head. 'You have forgotten my wishes very quickly!'

He was becoming more strongly excited. 'Tell me what you desire. I will withhold nothing. I can keep back nothing from you!'

'Then tell me about Mr Cahusac's father. I burn with curiosity.'

He frowned a little. 'But Cahusac—why of Cahusac and his father?'

'Why? Because I have a woman's inquisitiveness, which has no limit and no reason.'

His face cleared. Here was a feminine weakness which he understood. 'It is another man's secret; but'—— He paused.

'Another man's secret!' she exclaimed with a provocative laugh.

'Honour'—— he began.

'Is this a case of honour or dishonour?' she exclaimed reproachfully. 'Is it not more important that I have asked this favour of you?'

'Pardon, I had forgotten that. But to tell you those things I must go back and speak of my early life.'

'And will you not? Long ago you promised to tell me more of your history. Tell me of it now.'

'Lady, I will speak openly, for then you will know me as I am—the slave, the oppressed, the martyr, the hero!'

Puyfot plunged into his story like a man inspired. First he described his boyhood and the days of his early youth, when the world rolled like a panorama before his eyes, when he drank deep of the well of poetry; his first experiences, his hope, his ambition. He told her once more of poverty that held him chained, of his efforts to free himself, of the sudden vision of wealth as placed before him by the secret intelligence agents of Paris. He went on to describe his arrival in chill and misery in London, whither he had been sent by his superiors for the purpose of spying upon another spy, after the good secret service fashion. 'It was then that I became a slave!' he concluded violently.

'I was but sixteen years old, madame, a youth compact of dreams and faiths. Look at

me now; see these lines and hollows. He ran his finger over the outline of his face, while a couple of tears stole down his cheeks into the black ambushment of his little beard. 'It was then I first saw Cahusac *père*. He was pointed out to me by my companion, whom, you understand, I was to aid and watch as occasion required.'

'And he had orders to watch you also?'

Puyfot shrugged his shoulders. 'That goes without saying. It is so easy to betray, one must be upon one's guard. By-and-by we received instructions that an important move was contemplated by the Court of St James's. Sir Malcolm Cahusac was the personage we were to get in touch with if possible.'

'But surely you must have known that a man in his position was not to be tempted! Such things are impossible.'

'Generally, yes; but my confederate was as the devil—one who had resolved to rise, who was ready for any risk to attain a high place in his profession. He has succeeded. He is at this moment the head of the most influential secret service bureau in London.'

Puyfot wiped the drops which were gathering on his brow. 'We arranged our plans. Cahusac, although a man of the aristocracy and well placed, was, as we had discovered, comparatively poor. The extravagances of his second wife had drawn him into difficulties. She was a woman proud indeed, but vain with a vanity passing description. It was our business to learn these details, you understand. My confederate was empowered to offer him an immense sum for his—co-operation.'

'You interest me.'

'At the time it happened a lamp was broken and useless close to Stanhope Gate. We fixed upon that for our rendezvous. Ay, madame, there is one thing you others do not see—the romance of London; she is illimitable! London has no personification. How can you typify her? Some call her Danaë, ready to give all for golden gain. But London is rather a gigantic burrow—none know its windings. It is a lurid blaze of life where innocence burns to death. It is an all-seeing eye of wickedness flashing beneath the serene forehead of the stars. It is at once a desolate massiveness, a naked desert, and a great furnace of contact blown to white-heat by the wind of ambition and lust. It struggles from its vortex to the lipping river full of black mysteries, its grave face taking shadows from the ever-hovering angel of death! London, she is all these and more.'

Puyfot, in silence, looked for a moment or two between his narrowed lids as though he saw pictured the things he uttered; then, speaking in his usual voice, he continued: 'On a night that has lived in my memory, my colleague was to bring Sir Malcolm Cahusac to the spot where our proposal was to be laid before him. I, on my part, hid among the wet shrubs behind the Park railings. I watched from a point of vantage I knew of. There had been a ball at the Russian Embassy, on leaving which it was arranged that my friend was to intercept and draw away Cahusac. I saw them coming, and slipped back among the bushes and waited.

'My colleague stopped directly opposite to my hiding-place. Cahusac was speaking. "Now, sir, you brought me here to give me what you said was important information. Pray make no delay. If it is important you will no doubt be well paid for it." I can hear his scornful voice now.

'My colleague upon that spoke plainly. He offered Cahusac a fortune, believe me, madame, on the one hand, on the other a threat. Cahusac became angry; he cast back the offer in our teeth, and he, in his turn, threatened. Artistically he was a great figure; not to yield to the temptation would have been something, but he—he did not feel it to be a temptation!'

'Of course not!' Lorrie said impulsively.

'Of course not!' repeated Puyfot in glib scorn. 'That is the puritanical attitude of mind. It is not the result of individual virtue, believe me, madame; it is only a traditional conceit. And now, madame, I come to the end—I hide nothing from you. I was young, and before me was shining the way to great ambitions, and to —*Astoreth*. She, indeed, was yet unborn, but I already dreamt of her.'

Lady Madesson's face became a mask.

'I stood there and saw a vision, a vision of an ever-mounting road—my future! I saw myself crowned with success, made famous in an hour! That incident which had to do with Sir Malcolm Cahusac was to be the beginning—the beginning, you understand'——

'You surely never brought yourself to believe—— What do you mean?' whispered Lady Madesson. A chill of horror was upon her.

'Cahusac stood with his back to the railing. He said I know not what of scornful refusal. My colleague spoke of death. The Englishman laughed in contempt. And I—I waited ready at his back.'

Puyfot stopped and drew a long breath. He related the story as one who relates a noble adventure. 'My colleague raised his hand.' Puyfot's little beard shook with the excitement of recollection. 'It was the signal. I struck at Cahusac's back with my knife, and as I struck he turned towards me as quick as lightning. Perhaps some rustle of the leaves warned him. The knife, with its point in his coat, was jerked from my fingers, but my colleague seized it and drove it down and home. The Englishman sank where he stood, the knife up to the handle between his shoulders. He fell first to his knees, then sideways to the ground. The life was in him for a moment or two, but he could not call

out. He lay there feebly moving—this great man!'

Lorrie felt her throat contract as she listened. This was how Malcolm's father had died, the victim of a double treachery, done to death by those who had hoped hopelessly to tempt him to dishonour. She leant back in her chair with closed eyes; she could not bear to look upon the debased creature who had borne his part in the shedding of noble blood.

Puyfot, it may be, read something of the horror that possessed her. 'Dear lady, like a woman you faint at the tale of a battle!' he began.

'A battle!' she repeated with low, concentrated voice; 'no, the basest murder.'

Puyfot opened his eyes. 'You have misunderstood me, madame, or I have misunderstood you,' he said, after a brief silence. 'I was starving. It was I or he.'

The change in his voice roused Lorrie, reminded her that she must stifle her disgust, affect to look leniently upon his crime, or now, at the very moment of accomplishment, lose the main fact to which all this story led. 'You have the power of the dramatist,' she stammered; 'the details became too real as you uttered them; they overcame me.'

Puyfot glowed. 'Ah, I forgot my powers! Forgive me, madame; it was cruel to use them unsparingly with you! Yet do not shrink from me! Remember, it was not I who was guilty of the fatal thrust; it was not by this hand he died. Yet, as I will show you, I have been the one to suffer!' Bitter resentment woke in him again. 'That devil, the true assassin, has from that hour to this held me at his mercy. By some infernal trick he constructed a proof that makes it appear that it was I who stabbed Sir Malcolm to death!'

'Perhaps he threatens only?'

'Alas! no. Though I do not know what the proof is, I am entirely sure that it exists. For in my misery I have once or twice driven him to the limit. He has no fear of me. By his behaviour then I know that I am but too certainly in his power.'

'And after—what happened after—that night?'

'I fled from England. He drove me back to my old life—my old poverty—in Paris. I have not risen, I have sunk, until now! Curse him! Curse him! Curse him!' He stood up, shaking his hands to heaven in his fury.

Lady Madesson's white lips moved, and though her words were inaudible, Puyfot translated the sound to his own encouragement.

'He is rich; I am poor! But that fair hand of yours, madame, may have the force to weight the balance even between us—at last.'

Lady Madesson started violently.

'But—but what can I do? I am ignorant even of his name,' she forced herself to say.

Puyfot accepted her pallor and her emotion as evidence of a strongly moved sympathy. 'I will tell you who he is; I will confide in you. That traitor's name—it is De Sarsan!'

(To be continued.)

THE CATTLE-DROVER.

AN EXTINCT WORTHY.

By E. D. Cuming.

THERE are few old callings of which we know less than that of the cattle-drover, whose business, like so many others, was extinguished by the spread of railways. It is a pity, for the drover's occupation, if monotonous, was responsible, and the drover himself was a man of character; he was one of a brotherhood which played a very important part in the agricultural life of his time, and whose members often rose to comparative wealth. There are in the eastern counties of England at the present time families descended from Scottish drovers who made money and settled down in the district with which their work had made them familiar.

The cattle-drover formed the link between the breeders of the kingdom on the one hand and the men who fattened cattle for the market on the other. It was obviously impossible for the individual farmer in the Highlands of Scotland or in Wales to devote weeks to the task of driving a score of 'beasts' to the great grazing-grounds of Norfolk, Suffolk and Essex, where they were fed up for Smithfield Market (St Faith's, near Norwich, was the principal mart for Scottish cattle). This work was entrusted to the drover, who collected at some convenient centre, usually a fair or tryst, hundreds of cattle into one great herd, and conducted them to their remote destination, receiving from the owners a small sum per head for each beast safely delivered.

The Scots drover took the leading place among the brotherhood by reason of the greater distance he had to travel, and the greater risks of going through wild country in the days of freebooters; and latterly also by reason of the importance of the cattle-trade between Scotland and England. It is worth mentioning that the great landlords of Scotland in the north and west received payment of their rents in live cattle, money being scarce; and these rent-cattle were made over to the drover with as little delay as might be.

The experienced man was suffered to exercise a good deal of discretion in making up his herd for the journey, and this was only just. He was responsible for their safe delivery, and he would not take over beasts he considered unfit to stand the long days of travel; he looked over each bullock offered him, and rejected without scruple any he thought were not in 'good droving condition.' He would not handicap himself with the weakly or the lame.

Mounted on a sturdy pony, with little provision other than a bag of oatmeal, he set out on his tedious march southward, travelling with his charges at a rate of fifteen or twenty miles in the twenty-four hours. He avoided the high-roads as far as possible, high-roads meaning tolls, which on a long journey would swallow up profits. Moreover, the route over the waste lands, which in the eighteenth century formed so large a proportion of the kingdom, provided the needful grazing. There remain in many parts of the country traces of the old droving routes, whose names perpetuate memory of their use, such as 'cattle-way,' 'ox-drove,' or 'drove-road.'

There were recognised halting-places, some within reach of the inns, where the herd, for a small charge per head, might be confined in an enclosure at night; but very often the drover and his men 'rounded up' their charges on some tract of waste land, and slept in the open. The autumn was the principal droving season, the beasts being then in best condition to travel. They lost flesh on the way, of course. An old writer compares the 'native' cattle of Suffolk with the 'starved' beasts from the Highlands of Scotland, and pictures them fattening contentedly on pasture rich beyond their dreams!

For a long journey it was very usual to shoe them with iron plates after the manner of plough-cattle; it prevented footsoreness and made for expedition; but looking out for dropped shoes and discovering the beasts which lost them added much to the work of the drover.

So important was the droving part of the cattle-breeding industry that there were several breeds known as 'droving cattle;' the shaggy, long-horned Highlander was one, and the breed which is now known as the Aberdeen Angus was another. The Highland cattle were greatly valued, but they lacked one characteristic prized by the drover—they stood on short legs, and the drover naturally preferred a big, long-legged beast which could get over the ground faster, and was less easily 'bogged' in soft soil than a short-legged animal.

The magnitude of the trade from Scotland may be measured by the fact that one firm of dealers, Messrs Williamson, during the days of the Regency, used to confide about eight thousand head of cattle each year to the drovers.

It can readily be understood that the work was responsible. The man had to understand his business, and above all to know how to treat beasts on the journey—to begin by easy stages, discover the pace of the slowest, and gradually push the herd forward as it became more inured to travel. He had to guard against its mingling with other herds on the way, and that at the height of the droving season was no easy task; and he had to be ever on the watch to prevent straying and theft.

There were drovers scrupulous and the reverse. A stock story of the latter class describes an interview with the consignee of a herd who remarked that the beasts were in poor condition, and must have been overdriven. 'That's as it may be,' rejoined the drover; 'but there are eighteen more in the lot than when I started'—a reply which suggests the necessity for haste.

During the latter half of the eighteenth century, when the labours of Bakewell and other famous breeders had resulted in the production of vastly improved cattle, demand for these came from Scotland, and the drover who formerly rode home idle found work which made his return journey profitable, taking cattle and sheep for sale to such great marts as Falkirk. There is reason to believe this work was made particularly profitable by some of the fraternity. Too often an English employer was regarded as fair game, and the northward journey was attended by a large percentage of loss by the way, attributed of course to death, straying, or the cattle-thief who hung about the droving routes. The employer had no redress; he might have the best reason for thinking his improved cattle had been sold *en route* by the drover for his own advantage, but he could not prove it. There were no county police, no means of following up suspicion; and the owner who arrived at Falkirk by the coach to sell his stock had to accept what the drover restored to him. National feeling ran high in those days, and some Scots drovers held it no shame to swindle a Southron.

The drovers formed a class apart; when the cattle-trade from Scotland reached the dimensions of a great industry they rose to the occasion, and earned the reputation of trustworthy, capable men. They kept themselves much to themselves; the nature of their calling made them silent, self-contained, and independent. Of necessity they were hardy and robust. There was, as we can imagine, a certain charm about the business, and many of them stuck to their half-vagrant life until they reached an advanced age. The calling was one that made for longevity.

The drover did not always remain a drover, convoying other men's cattle at so much per head. Often, when he had saved a little money, he abandoned the rôle for that of 'jobber,' a business which had the merit of combining a wanderer's life with profitable trading. As a drover he had become known to and trusted by farmers on the line of country he travelled, and the connection so formed laid the foundation of his new business. The jobber bought, on credit if necessary, cattle

from the breeders and took them to market to sell on his own account. Some of the shrewder jobbers made considerable fortunes in this way. The jobber was not always favourably regarded by the farmer, who was too much at his mercy. For example, in George the Third's time there was great demand for Welsh black cattle for fattening purposes. These beasts, known as Pembrokeshires, were small, and the leading breeders wished to improve them by crossing with larger cattle, thinking to benefit the poorer farmers. But endeavours to improve the breed failed; the graziers of East Anglia wanted the beasts they had always known as Pembrokeshires, and the jobbers refused to buy any but the small black cattle. If they consented to buy another, it was done as a favour and at a price 20 or 25 per cent. less than the beasts of the accepted type. The drover turned jobber 'worked' a round in two or three adjacent counties, and in Wales, at all events, often carried on a credit business, paying the farmers after he had disposed of the cattle on the other side of England. It was a risky way of doing things for the farmers, in those days of highwaymen; but they were in the jobber's hands, and had to take chances.

There was, of course, a great deal of local droving, convoying cattle for comparatively short distances; and this business was very generally in the hands of women, an unprepossessing sisterhood, according to the occasional glimpses we get of them in the pages of contemporary writers. Women were liked as drovers by the farmers, as they were more indifferent to bad weather than men, and they conducted the cattle on foot, a method which ensured easy travel for the beasts. We can well believe that they were unattractive, with their weather-beaten faces and the command of language for which they were notorious.

After the drover of grazing cattle came the man who plied his calling principally between the eastern counties of England and Smithfield Market. This business was more tedious than convoying beasts in 'light marching order' from the Highlands or from Wales. Fat cattle must be driven carefully lest they suffer by the way, and the pace approved was funereal. Droving fat cattle for the London Christmas market must have been a dreary task—the miles of slow plodding along roads knee-deep in mire, or over the flat, sodden wastes swept by wind and rain; the continual halts to rest the beasts, whose swagging sides made them the very worst of travellers; the frequent breakdown of the over-fat. The drover, who spent his Sunday in the grazier's fields looking over the beasts, marked for him, must have regarded them with no very friendly eye. By the way, droving on Sunday was declared illegal by an old statute (3 Chas. I.).

A French authority who investigated the economics of droving about the end of the eighteenth century arrived at some interesting results. He found that, on the average, a beast which had come three hundred miles by road to Paris lost from sixty to eighty pounds weight on the journey; but he maintained that this loss to the butcher was the customers' gain, as the beef of a driven ox was much more nutritive than that of one which was killed on the spot where it had been fattened. This was probably true; there is no beef to compare—it is heresy to say so—with that of the ox which, after four or five years of work in the yoke, has enjoyed a few months on good pasture before going to the butcher. That was the 'roast beef of Old England;' but you only taste it nowadays on the tables of French country gentlemen who work their own cattle till they are seven or eight years old, and then 'turn them off' to fatten. The butcher, being human, looked to avoirdupois, and as he bought his meat 'on the hoof,' it was very necessary not to overdrive; whence the old saying, 'Who drives fat oxen should himself be fat,' a well-fed man being less addicted to haste than a spare one.

Lowest in the droving hierarchy came the man of Smithfield whose business it was to take over the cattle when they arrived in the market-place and conduct each lot to its appointed spot in the market. The Smithfield drovers were a class by themselves, and their distinguishing characteristics were courage and brutality. The three and a half acres of which the market-place consisted provided iron rails which would accommodate only about half the number of cattle brought for sale on Monday; and those beasts were fortunate which came early enough on Sunday night to be tied to a rail. Later arrivals passed through an ordeal which became a public scandal. The only alternative to tying up was to form what were called 'off-droves' or 'rings'—bunches of from fifteen to twenty cattle in a compact group, heads inward; and it was the Smithfield drover's task to form these rings when the rails were full. The country drovers made a point of timing their journey to arrive on the outskirts of London on Saturday night for Monday's market. The drove was allowed to rest on Sunday until late in the evening, when the streets were fairly clear of traffic, and then continued the journey to the market-place. Hence the work of the Smithfield drover was performed at night, and pandemonium reigned until the small hours as the men forced the cattle into 'off-droves.' Already excited by the strangeness of the streets, as the cattle were, the methods of the Smithfield drovers—each armed with a blazing torch (necessary to distinguish the mark placed on every beast) and a heavy stick—were not calculated to soothe; and the market-place was a chaos of bellowing cattle galloping blindly to and fro, headed and beaten back with torch and staff by shouting men. The only way of forming an off-drove was to surround the wretched creatures and beat them about the hocks and hind-quarters till they bunched together too terrified to move;

if a beast turned to show its head, it was beaten with staff or torch till it faced about and forced its way into the ring again. It often took an hour to form a single off-drove—an hour of continuous torture for the cattle.

Nor did the beast's sufferings end here. Having learned that immunity from burn and bruise was to be won by standing in a bunch, the bullock had sense enough to object when, selected by a purchaser, the drovers sought to get it out of its ring. Once out, it made frantic endeavours to force its way into other rings, to be beaten about the head until it desisted and could be goaded out into the streets, where fresh terrors awaited it, and, always wild with pain and fright, and often blind from reckless blows, it was itself a source of danger to every passer-by. It was most difficult to get a beast from an off-drove out of the market.

Our ancestors were not particularly sensitive about cruelty to animals in those days of bull-baiting and kindred amusements; but the brutality of the Smithfield drovers was too much for the public conscience, and some sort of control was established about the year 1790, when each man was required to wear on his arm a numbered badge by which he could be identified. We may doubt whether this measure produced any marked results. The market was no place for spectators, either by night or by day, and butchers and drovers had the place much to themselves.

The continuance of Smithfield as the principal cattle-mart offers a striking example of the tenacity with which we cling to old institutions. Though the streets on market-days in the 'twenties and 'thirties were constantly the scene of shocking accidents in which some half-maddened bullock was the actor, though traffic was interrupted, and even the mails approaching and leaving the General Post-Office were delayed, Smithfield held its own. Vested interests were strong, and the stoutest opposition to plans for closing the market came from the occupants of houses overlooking it; no doubt they found compensation for two or three sleepless nights per week in the patronage of butchers and drovers.

A spacious market was laid out at Islington in 1834—Islington was then on the outskirts, and cattle could assemble there from all parts without passing through the London streets—but tradition was too potent. For eight centuries or more—from the time of Henry the Second and probably much earlier—Smithfield had been *the* market, and *the* market it remained, while the weeds grew and the rails rusted in Islington for another twenty years. Then the Corporation, in 1852, came to the tardy conclusion that a cattle-market almost in the heart of London was a public nuisance and a public danger, and under an Act of Parliament it was closed. Islington came into its own; the Prince Consort in 1855 formally opened the 'new'—'neglected' would have been the better word—market, and Smithfield, with its drovers and brutalities, came to an end.

Turning for a moment again to the more pleasant phase of droving as exemplified by the men who conveyed cattle by hundreds the length of the kingdom, it is curious to find that a hundred and twenty years ago the cost of sending beasts by road was almost the same as the cost of sending them by rail in our own day. Oxen could be driven from Dumfries to London at a cost of from eighteen shillings to twenty-four shillings per head; and the cost of sending a truckload the same journey now works out at from seventeen shillings and sixpence to twenty-three shillings per head, according to the number which can be placed in a truck—six to eight, as size determines. In this regard, however, we must bear in mind that the buying-power of money was perhaps double what it is at the present time.

A large number of cattle were driven from the north direct to London or the markets on the outskirts in George the Third's time. They were purchased by the great brewing firms, which found it profitable to turn their 'grains' into beef.

THE MINERAL WEALTH OF THE RED SEA BORDERS.

By A. J. Park Crawford.

IT has long been known that the mountainous borders of the Red Sea are rich in minerals, but only within comparatively recent years have the various fields been exploited to any extensive degree. Reliable and fairly exhaustive geological surveys have so far been made only of the Sinai peninsula and the western border, the latter survey extending well inland. The eastern side, being under Turkish domination, is still an unknown region. It is reasonably evident, however, that as the outcrops on the eastern border resemble those of the rich western, many deposits await profitable working under an improved régime.

Each coast is peculiar in that it consists of a chain of hills extending without much break from end to end of the Red Sea, but very little inland. Although many of these hills are of volcanic origin, the bulk of evidence tends to prove the existence of the depression in which the sea is to be due to contraction of the earth's surface or other internal disturbance. At present capital is being lavished on the western Sinai and Egyptian coasts. The recent successful oil-

boring operations, which are being carried on by powerful syndicates, are of world-wide importance, and have caused intense financial interest. These operations are confined to the coast from Suez to as far south as Tor, a distance of one hundred and twenty-five miles, and on both sides of the Gulf of Suez. Tanks are being erected, piers constructed, and everything prepared to supply ships with liquid fuel practically on the spot where the oil is found.

On the Sinai peninsula are found copper, manganese, oil, iron, and turquoise. The western side of the Gulf of Suez is the scene of many activities. The Ataqa Hills, just south of Suez, furnish lime and sandstone and turquoise. A little north-west of Shadwan, on the coast, are found sulphur and petroleum. The latter is being prospected for at Zeitieh, Gaysun, Jubal, Ras Deeb, and Gymsah; at the last-named place several wells are in operation. Phosphates occur at Safaga. To the north are granite quarries, and to the south old gold-mines; in fact, old gold-workings are to be found, mostly quite abandoned, down the coast for about three hundred miles. It is a question if cyaniding would be a profitable undertaking at some of the older workings. Marble is being quarried south of Kosseir, and sulphur is found in varying quantities for some considerable distance along the coast.

It is astonishing that the exploitation of these rich fields has been left until such recent times; but development should be on a large scale, in view of the impetus which has now been given to prospecting. It is a matter for congratulation that British capital has been first on the scene, and there are strong grounds for belief that this enterprise will meet with its due reward.

BRITISH MACHINE-TOOL MAKING ACHIEVEMENTS.

THE most significant factor in the industrial world for a score of years has been the development of the machine-tool—that is, the machine which is used in making another machine or some part of it. Wonderful as the progress of automatic machinery has been in the past, it was never more wonderful than it is now; and it will be more so in the near future.

Of course the term machine-tool is one of wide scope, including the lathe and boring-mill, drilling, slotting, and planing machines, the steam-hammer and powerful hydraulic press, the tool which turns the shaft of a giant White Star *Olympic* or the cylinder of a Great Western locomotive; or, at the other extreme, such minute tools as the tiny revolver-like pneumatic hammer driven by compressed air, and the diminutive lathe turning out the minute screws and wheels forming the components of a watch and similar mechanisms.

While the expansion of machine-tool making has given an extraordinary fillip to industry, it is no new thing, as shown by Nasmyth's steam-hammer, Maudslay's curious lathes, and Sir Joseph Whitworth's masterly inventions. These pioneers in the machine-tool movement produced clever and enduring work, some of which operates satisfactorily to-day. The British inventors made tools to last, unlike their American rivals, who anticipated their production finding its way to the scrap-heap at an early date.

An outsider cannot realise the marvellous ingenuity displayed in most of the machine-tools in use at the present time. These do almost everything but think, and even that specifically human quality seems within the limits of possibility, for machines are now made which select automatically the required article from a number of the wrong size or form. This second aspect of machine-tool design is receiving more attention in view of the fact that repeated endeavours are being made to put on to the machine some of the duties now being performed by the operator, and so enlarging the capacity of the machine and the scope of its functions. In the current language of the 'shop,' the machine must be a good tool and a clean tool, and also do its work accurately and rapidly, with reasonable economy of power and material. But this is not all, say the more progressive inventors; it should be replete with devices for superseding human labour and control, and, still further, do work which is only possible when the human factor is absent or probably diminished.

A new era for the manufacture of machine-tools began with the memorable engineers' strike of 1897–98, which gave an immense spurt to this industry. The British masters, who at the outset bought tools largely from America, quickly recognised their less dependence on the 'human factor;' and, while they admired the marvels of skill in the American tool, they were not slow to copy its good qualities and to abandon its faults. The result was that makers in Great Britain considerably extended the sphere of usefulness of machine-tools. They have, for instance, supplanted the shaping and planing tools with vertical and horizontal milling-machines, and have confined the once encyclopædic operating lathe to lathe-work proper, the processes of boring, polishing, and grinding being better effected on specially made machines. Americans, however, must be credited with the idea of the milling-machine and boring and turning mill, the two former revolutionising practice in the machine-shop. The Briton, too, has improved on them, and a dozen British firms are nowadays making these. Mention should be made of the resourceful turret lathe, a comparatively modern comer,

but thoroughly installed as an important labour-saving tool; the celebrated firm of Messrs Alfred Herbert (Limited), Coventry, excel in captain or turret lathes, in surface-grinding machines, and machines complete with outfits of tools.

Another notable invention by Englishmen consists of the disc surface-grinder, which did away with bygone filing methods, and is now applied to work of the most varied kind once done on milling and shaping machines or by means of the file. Within recent years a number of special tools have come into existence which perform multiple services, in all of which, despite American enterprise, British makers hold pride of place, just as they do in shipbuilding and cotton machinery. This, doubtless, is largely due to their introduction of high-speed steel in 1900, enabling them to outdistance the whole world as specialists in the production of tool steel, in concert with machine tool-builders making the strongest tools for cutting metals at high speeds. One cannot look with other than feelings of admiration upon lathes, planing and milling machines, or drilling machinery, which amaze the casual visitor by their number and variety, and arouse the enthusiasm of the engineer by their design, by the work they do, and by the splendid organisation that has fitted them into an almost perfect scheme of economic production.

Each machine-tool is a record of a triumph. In mining operations, for example, a coal-cutter invented by John Gillott & Son, Barnsley, will cut from twenty yards per hour in the hardest coal, or, as recorded, twenty-one thousand one hundred yards holed in one thousand seven hundred and twenty-six hours, in six months, in a twenty-eight-inch seam of coal, including all stoppages, and producing twelve thousand five hundred tons of coal. Splendid records come from American firms, many railways being equipped with lathes for car and driving wheels doing prodigies of work. Certain lathes turned out from sixteen to twenty pairs of thirty-six-inch car-wheels in ten hours, the fastest performance in the West Albany shops being twenty-five pairs of thirty-six-inch wheels in seven hours and fifty-four minutes, with one operator and one helper. Extremely heavy milling was performed at the American Locomotive Company's works at Dunkirk on a Bennett milling-machine. This machine, during tests, had removed nearly twenty-three pounds of metal per minute, and a practical cutting capacity was stated to be six hundred and seventy-two pounds of metal per hour, the cutter being provided with inserted blades of high-speed steel. The introduction of high-speed steels has been followed by the complete redesigning of machine-tools to secure increased rigidity, power, and facilities for obtaining wonders in production.

Corresponding machine-tool achievements were shown in the drilling-machines of D. & J. Tullis (Clydebank), William Asquith (Halifax), and Drummond Brothers; in the boring-mills of Webster & Bennett (Coventry), George Richards and Co. (Broadheath), and John Stirk & Sons (Halifax); the machines for shearing iron and steel-plate by De Bergue & Co. (Manchester); the milling-machines of Cunliffe & Brown (Manchester); the slotting-machines of the Smith Slotting-Machine Company (London); and the marvellous Drummond-Barreto combination tool or universal screw-cutting, turning, &c., machine. All of these have created a sense of surprise at their fine finish, and amazement at the complexity of detail.

But the Americans continue formidable competitors for a share of the world's tool-trade. Formerly unwilling, as a nation of inventors, to learn anything from across the seas, they are susceptible to-day to ideas from any quarter of the globe, and as willing to cast aside their own inventive 'plant' if a more economical one offers itself. Several of the American firms even specialise on one kind of tool, making it a life-study if need be—a feature, by the way, which a number of British companies are adopting, and thus contributing not a little to give them priority among the machine-tool makers of the countries of the world. We may, in passing, refer to the disuse of the steam-hammer for the pneumatic and power hammer, pneumatic tools, in fact, ever finding wider fields to conquer. It is also noticeable that machine-tools are being increasingly fitted with cutting parts or with drills, milling-cutters, boring-bars, &c., marvels of contrivance which a number of firms produce.

Remarkable to note, textile-machine firms, principally in Lancashire, which are splendidly equipped with machine-tools, are capable of undertaking the complete furnishing of a cotton-mill, and can easily fit out a number of mills in the course of a year.

In every direction inventive genius is increasingly exhibited, the search for simplicity and incredible accuracy being particularly aimed at. By the adoption of the limit-gauge, engineers are able to produce work true to more than one ten-thousandth part of an inch, and as the science and art of correct measurement is the basis of all modern methods of machine-tool industries, a proficient machinist will make this his chief object to understand. Here, again, Britishers have borrowed the limit-gauge system from Brother Jonathan, and adapted it for their own specific needs, recognising that perfect accuracy from start to finish is the only road to final perfection. In illustration of the value of gauges as an accurate measurement, it may be mentioned that at the Villar Perosa Motor Company's works in Turin, where Whitworth gauges are in use, a machine which dominates the whole is used for testing the gauges manufactured on the spot, which measures accurately to one two-millionth of an inch—a sufficient proof, if necessary, that workmen artists yet exist in the world.

It is quite evident that in machine-tool designs finality is an unknown term; nor can it be otherwise with high-speed steels in the ascendant, while the question of correct speeds for machine-tools is receiving the attention of the whole engineering field.

The question of the effect of machine-tool machinery upon the individual workman is not easy to answer. As a rule, the machinist, as distinguished from the labourer and the skilled artisan, cannot find his employment elevating, and, unless he has a soul above it, is not fitted for anything superior. Over against this, however, it is contended, as in the working of the automatic lathe, that the machine does the work and the man supplies the intelligence; so the same thing holds good in case of new tool-steels where operative labour is relatively much more necessary than it was, and a saving in cutting times relatively less important. Significant, too, is the experience that the introduction of up-to-date machines and methods in workshops has a stimulating effect on the mind of the workers, as indicated by several of the most modernly equipped shops containing the best men. This being so, it tends to disprove, in part, the suggestion that workmen are degraded by the use of tools that do everything but think or by machines that are almost human. It is still undeniable that although the machine-tool may subordinate the worker, it cannot wholly surpass human skill and direction.

The influence of machine-tool production upon the labour market is, perhaps, a more complex question. Advance, always, must spell displacement for many of the workers; nor is it possible to introduce new machinery and improved methods of production without this inevitable sequence. On the other hand, there are compensations, inasmuch as labour is being constantly absorbed by fresh modes of industry. The adoption of a new idea, major or minor, for example, generally entails a secondary invention in the form of machinery capable of making the desired part; while the replacing of worn-out machinery calls for vast numbers in the army of industry. From another standpoint it may be noticed for the consolation of the toiler that mechanical facilities cheapen the commodities of life and add not a little to the total sum of happiness. That is to say, the development of mechanical processes spells increasing production.

Meanwhile, amidst the foremost European nations, there is a ceaseless rivalry in the arts of peace; and, although Britons may astonish the world with their mechanical genius, they have more to fear from the army in the foreign workshops than from the army in the foreign barracks. If the British tool-maker is beaten in his own market by the foreigner he will be beaten in neutral markets; but if, on the other hand, he can excel the foreigner in the British market he will beat him in every neutral market.

TWILIGHT MEMORIES.

I WAS dreaming alone of days gone by,
And of golden lands afar,
(In old gardens, veiled by a summer mist,
Where lilies nodded to roses by dew-drops kissed,)
'Neath the light of an evening star.

Fairy castles my brain had built,
'Mid the scent of the new-mown hay,
(As a bat flittered by till lost to my sight,
And a sleepy bird cooed a soft 'good-night'—)
'Twas a beautiful evening in May.

Golden memories brought sweet enchantment,
We were roaming the world together;
(As a velvety swallow whispered soft to a mate,
And the moonbeams crept down to the silvery lake,)
In the balmy spring-time weather.

Thoughts drifted to tropical nights of white lustre,
Or to Indian sunsets of purple and gold;
(While a fat brown bee went booming along,
And a thrush trilled sweetly his evening song,)
To comfort a heart grown cold.

Sun-kissed palms, wooed by spice-laden breezes,
Seemed to flicker across my sight,
(As some innocent lovers darted by with a scramble—
Just two little field-mice out for a ramble,)
And twilight deepened to night.

I stood with you there 'neath the Austral stars shining,
In the sweet air scented by wattle and musk:
(Then I woke with a start as I heard the kine lowing
In the distant park, where a light was glowing,)
As a soft whistle came through the dusk.

Were we still speeding on past snow-capped Rockies?
Was it only fancy, or was I asleep?
(Tu-whit, said an owl from a quaint old tower,
As an angel's tear soothed the heart of a flower,)
And I too had learnt to weep.

We were sailing just then on a radiant ocean,
Having passed through storm in the China Seas;
(While an inquisitive squirrel peeped down from the cedar
With a whisk of a tail, though none seemed to heed her,)
And some one came swift through the trees!

Over moon-swept lawns he was coming to greet me,
Tender gray eyes beaming soft as a dove;
(The birds were silent, the mice were sleeping,
Only the shy little squirrel was peeping,)
And *he* heard the Whisper of Love!

. . . . . .

Do you wonder what called up these twilight memories
That have come to me in the spring?
(Neither bird, nor bee, nor stars now gleaming,
No—though lovely—*these* things had not set me dreaming,)
'Twas the touch of an angel's wing!

THE FUTURE BRIDGE.

By B. S. Townroe.

LABOUR has learnt its power—the power of solidarity—and capital is anxiously seeking for new weapons of defence and protection. Between these two opponents the country suffers, and longs to find some means of stopping the constant industrial strife, and living in unity and peace. Clerk on office stool, shopman behind the counter, doctor in his surgery—all the middle classes, whether upper or lower in rank, whether they be engaged in business or professional duties, are punished by the present rifts in national life. Unorganised, almost speechless, long-suffering, the stratum of Britishers who live on an annual income ranging from one hundred pounds to seven hundred pounds is squeezed both from above and from below. The middle classes must now exert all their influence to emphasise the fact that a nation depends on character, brains, money, and manual toil, and that all these forces must be united in their ultimate aim, or else the nation will be disrupted.

It is, therefore, of particular importance at a time like the present, when our country has been nearer to revolution than at any other time within our memory, that any method for unifying the nation, for keeping open peaceable communication between the divided classes, should be seriously considered by the thoughtful sections of the community.

Except in country districts, rich and poor seldom appreciate each other's good points, and it is this lack of personal knowledge which enables pernicious doctrines of class hatred to find gullible listeners among the crowded inhabitants of our large towns. The semi-educated artisan cannot correct the imaginative description of luxury and capitalistic malice presented to him, for on few occasions does he meet one of the maligned class on any basis of friendly relationship. On the other hand, the well-to-do are often equally ignorant of the conditions of life of their poorer neighbours, and consequently their unsympathetic references to labour questions only make the dispute more bitter.

A good instance of the suspicion felt by the artisan is a significant sentence addressed to the writer by a sergeant in the last Territorial camp: 'I allus tell the men that it does 'em good to speak to an officer, and that the officers ain't bad when you get to know 'em.'

This segregation of classes is one of the most manifest results of the factory system, and daily the distinction is becoming intensified with the conversion of old family firms into limited companies. Under the mediæval guild conditions, when each man rose successively from apprentice to journeyman, and from journeyman to employer, the relations between the three grades were very close; but with the growth of industrial combinations the gulf has widened and deepened to such an extent that a bridge to unite the opposing parties must be discovered if we are to keep our place in the world.

There are, indeed, already many planks across the gulf in the form of scholarships leading from the elementary school to the university, or philanthropic work performed by rich and poor in church or chapel; but these are only used by the cleverest or the most religious, and there is in truth no national organisation acting as a permanent bridge open to all classes. At any gathering organised by political body, business firm, or religious denomination, there is very often a tone of patronage on the one side and an undercurrent of suspicion on the other. From birth to death the gulf remains fixed, and only a few of the best of the weekly-wage earners succeed in crossing. Mr Arthur Henderson, M.P., for example, if placed beside many an employer with whom he has bargained, would be notably the better man in brains, power of expressing himself, and in bearing. Such cases, however, are exceptional, and the present opportunities of intercourse promote mutual sympathy as effectually as a string of beads converts a South Sea Islander into a Christian. The majority of the labouring men never meet their employer face to face. Dividends seem to them an iniquitous tax upon their hard labour, and the hostility grows to such a state of revolt as was witnessed during last August. The street-corner boys are the dregs of one class; the cigarette-nibbling, whisky-tippling, bone-idle youths are the dregs of the other. The hooligans of each class bring disrepute on their respective ranks, and add venom to the old bitterness. Discipline is the surest cure for hooliganism, and personal intercourse the most permanent remedy for class suspicion.

One measure, which for some years has been placed before the electorate by the National

 [*All Rights Reserved.*]

Service League, provides by means of universal military training a just method of applying discipline indiscriminately to all sorts and conditions of men, and also gives every man an equal standing in the ranks of a citizen army. When the proposals of the N.S.L., modified possibly in detail but not in principle, come into force, every able-bodied young man, whatever his worldly position or title or possessions, will be compelled to receive military training in school, and later from four to six months' training in camp at the age of eighteen, nineteen, or twenty. Promotion is to be by merit only. This has been clearly stated in the official programme, the provisions of which are as follow:

'No person shall be recommended to His Majesty for appointment as an officer of the Territorial Force who (*a*) has not either undergone training as a recruit or held a commission as an officer of the Regular Forces for at least one whole year; and (*b*) does not satisfy the prescribed conditions as to age, educational qualifications, physical fitness, and any other requirements which may be prescribed.'

On this important point there is solid agreement with the bills brought forward in two other democratic British communities, for in Australia paragraph 11a of the Defence Act, 1909, is to the effect that 'all promotions in the citizen forces to the rank of officer and non-commissioned officer shall be from the ranks of those who have served in the ranks of the citizen forces;' and the Internal Defence Bill of New Zealand 'abolishes the selection of officers by popular election, and provides that all commissioned officers in the Territorial Force shall be appointed by the Governor, on the recommendation of a board of selection appointed by the council in each district.'

There is, then, no faltering or doubt on this matter in the official programme of the National Service League, but the vast change proposed is often overlooked or misunderstood. If it is carried into law we shall see the son of a millionaire shouldering his rifle by the side of the son of one of his father's manual labourers. Next to them in the ranks may stand a clergyman's son, next the heir of the local baronet, next a grocer's lad, next a youthful blacksmith. There is to be no unfair discrimination, and the success of the system in other Anglo-Saxon communities affords real ground for trust that even in our class-divided country the just equality of national service may yet be instituted.

In the training-camps, held for the most part during the summer months in rural or seaside districts not too far from the recruit's home, and yet not too near to the temptations of town life, the young men will do similar work side by side, sit at the same mess-table, eat similar food, and sleep in the same tents. Only those who have worked in a boys' club can appreciate the real value of different classes sharing together a life in common. What opportunities there are to see the good points of the manual worker, and *vice versâ!* A fill of a pipe of tobacco, a proffered 'Woodbine,' a novel lent to a poorer comrade, may lead to burning conversations on problems of the day, which will be illustrated by forcible examples from personal experience of modern conditions. Such conversations will foster a spirit of better understanding and increased mutual respect. The performance of a common duty will help to refine the roughness of those engaged in manual toil, and will harden those whose softer tasks incline to effeminacy.

No doubt at the end of the four months' training there will be some topsy-turvy positions. Ability and character must force themselves to the front if given a fair chance. The baronet's heir may still be an unwilling private, while the reliable young blacksmith will wear a stripe. The rich youth, born with a silver spoon in his mouth, unused to discipline, with a tendency to over-indulgence in whisky and musical comedy, may have come to his senses in the fresh air, and be working hard for promotion. The grocer's lad, mind sharpened by business over the counter, and quick to seize every opportunity of advancement, will have risen to be a sergeant. The clergyman's son, who up to the age of eighteen has hung uncertainly in his choice of a vocation between the Church, teaching, and the Colonies, will now discover in himself a taste for army matters and a *flair* for command. He will, therefore, enter a school of instruction, and in time probably obtain a commission.

In short, one object of the advocates of national service is to bring to pass in Great Britain the ideal expressed by Plato in his *Republic*, that in sound social organisation every man should be assigned to the rank and function for which his character and abilities fit him, whatever his parentage may be. Plato and Lord Roberts are alike in their wish to convince their fellow-countrymen that a good citizen must realise that he is first and foremost a servant of the community, and that his position in the State shall be based not on birth but on capacity and attainments. This ideal, consistent with the democratic tendencies of the present generation, forms a necessary counteractive to the dangerous doctrines so prevalent in political circles, which may be summed up as, 'Get as much out of the State as you can, and give as little as you can.' Instead of this popular but unsound doctrine, the National Service League is seeking to forward an ideal which aims at relieving the already overburdened State and reducing the load by compelling every able-bodied Briton to take his share.

THE CAHUSAC MYSTERY.

CHAPTER XXVI.—LORRIE MAKES A BARGAIN.

LADY MADESSON went to the theatre that evening with a party of people, and afterwards sat through a supper; but nothing she saw or heard could draw her mind away from the picture of Puyfot raving out his wrongs, his self-pity, and his half-insane desires.

When she reached home, feeling she could not hope for sleep, she wrapped a dressing-gown about her, then flung wide the window and sat by it. Rain was falling heavily. There had been a storm away to the north, and she could still hear the rumble of the thunder as it grew fainter in the distance. The dismal pattering of the rain made a fit accompaniment for her mood of despondency. Existence was a wearisome puzzle—struggles ending in defeat, effort turned back upon itself; no matter how unselfish her aim, disheartenment had concluded each chapter of her experience throughout her life. The last, which had opened with her liking for Malcolm Cahusac, was now about to close with her worse than wasted endeavour to aid him in his difficulties. She had degraded herself to act a spy's part, and, strangely enough, had never seen the blind end towards which she was travelling until Puyfot's words, 'I confide in you,' opened her eyes to the true aspect of her position. In her eagerness as a partisan of Malcolm's she had lost sight of all other considerations, and she now found herself aware of this terrible secret without the power to make use of it! She could not betray Puyfot, not only because she knew him to be in the grasp of De Sarsan, but because, having won his trust and his confidence, it would be unthinkably base to betray him. She could never have done it. She saw that now too late, and shivered at her own folly.

The summer dawn came, lemon-pale, over the housetops into a clear sky before she threw herself upon her bed, tired of thinking. Malcolm had now become closely enshrined in her love; her heart moved out to him in a flame of pity; she could see him, in his loneliness, believing himself too proud to regret the world's esteem, for she could not doubt that as things stood to-day the general verdict would be against him. She blamed herself for not foreseeing how worse than futile was her endeavour to interfere where Puyfot was concerned. Now, the very fact that she knew so much paralysed her. She lay wide-eyed while the summer daylight turned to gold. She comprehended there was no further room for her in the unveiling of the mystery which might yet spoil the life of the man she loved.

Then in an instant she sprang from her bed and stood aghast and cowering, gazing wildly at her own drawn face in a distant mirror. Her personal perplexities, Puyfot, Malcolm himself, were swept from her mind as she recollected that within a few days Alice Lanceley was to become De Sarsan's wife! The horror of it, knowing what she knew! It must be stopped—yes, at once!

Stung by the thought, she hurried through her toilet in a frenzy, and it was only as she passed across the hall that the clock-face brought her to a standstill. Five o'clock! She must wait for hours and hours!

These hours brought her bitter counsel. Alice could not be permitted to marry De Sarsan; but how was it to be prevented? She might appeal to Mrs Westaway, but she could scarcely hope to influence that complacent lady when she had no reason to urge, no excuse to offer for what must appear to be a piece of outrageous interference! She might beg them to postpone the marriage for six months even—to give just a little breathing-time, during which surely something would happen, something come to light. But it was not to be supposed that Mrs Westaway would listen to any such wild request or consent to make the slightest alteration in the present arrangements without very good cause shown; and Lady Madesson could show no cause, could produce no reason. For, even if she repeated the tale Puyfot had told her last evening, De Sarsan was possessed of the power to fasten the guilt upon that wretched man and probably to exonerate himself. She had studied De Sarsan to some purpose, and she was sure that he had not waded into such deep waters without holding in readiness a certain means of escape. She saw no hope whichever course she chose to follow. To tell all she knew would merely raise a purposeless scandal, condemn Puyfot, and leave De Sarsan free; for, unless she could offer sound excuses for her intervention, Mrs Westaway and the Lanceley clan would simply regard her as mad. Possibly, if she had known anything of Lord Lindersmere and his determined methods, she might have applied to him with success. But he was an unknown quantity to her.

Yet Alice must be saved. Of course the fact that Malcolm was deeply in love with the girl added to Lorrie's eagerness; but in any case she would, for the sake of humanity, for the honour of womanhood, have done everything that was possible to rescue her. But to rid Alice of De Sarsan meant to pave the way for the girl's marriage with Malcolm. It was this latter thought that ultimately gave to Lorrie the one suggestion that promised any semblance of success. This, in its turn, carried her mind back to the question she had asked herself on the evening of the Sheringhams' garden-party, when, standing by Malcolm's side, she had felt

willing to give up her life for him. There were other sacrifices harder to make, she had thought; but would any one of them be too much? She was finding the answer now. The only feasible plan would demand such a sacrifice from her, and her whole body and soul revolted. For two days and two nights she wrestled with herself, waiting and hoping against hope that some way of escape might open; but when the time came she knew that she must make the sacrifice.

The wedding was fixed for Monday; thus the Saturday morning brought home to Lady Madesson a conviction that the evil moment was upon her, and must be put off no longer. She sent a telegram at an early hour, to which she received a reply that further discouraged her, a malicious trick of fortune which added enormously to the difficulties she had to face.

Before noon, however, her motor was at the door, and whirled her away to 241 Park Lane. The front of the house, gay as it was with window-boxes, seemed to frown angrily upon her; it looked a fateful house, haunted with the shadows of old sorrows.

Mrs Westaway's carriage was waiting, and Alice met Lady Madesson on the doorstep.

'I am sorry my brother is not well enough to go to Devos Square to see you as you asked him to do,' Alice said coldly. 'He is able to get out every day, but not for long, though he is much stronger'——

'That will do, Alice!' Wil suddenly appeared in the hall behind her. 'Lady Madesson does not want to discuss all my symptoms.—Horrid habit the women in this house have of gossiping about illnesses! Come in here; the library is about the only place where one can be sure of finding peace.'

He followed Lorrie into the room and closed the door.

'Lord, Lorrie, how ripping you 're looking!'

She was very pale but beautiful. She took a chair and gazed silently round the room. Malcolm's story of the events that had passed inside its walls was very fresh in her memory.

'If I had known how ill you were I might have been tempted to pay you a visit,' she said with a slight smile; 'though I am not at all sure how Alice would have received me!'

He frowned peevishly. 'Alice takes too much upon herself. She replied to your wire this morning without asking me. I wanted to go to you. Perhaps you would have allowed me to lunch with you? It seems a year since I took a meal out of this house! Your rooms are always full of sunshine and happiness. Heaven knows, I want a little of both! Alice and Aunt Marion are as cheerful as a brace of mutes.'

'Will you lunch with me to-morrow?' Lorrie said. 'You look much better than I expected.'

He examined his face at a mirror between the windows. His thin cheeks were flushed and his eyes bright with the excitement of her coming.

'By Jove, I don't look half-bad, eh? You have done me good already, Lorrie. You always do!' He would have taken her hand.

'Will you not ask me why I have come?' she said, motioning him to a chair opposite to her.

'I don't care a hang,' he laughed, 'so long as it gives me your company.'

'It is something very important.' The significance of her tone struck him.

'Nothing can be important unless it has to do with myself—or with you.'

An exquisite flush rose slowly into her cheeks; her eyes were hidden from his by their long lashes.

Wil stared at her. Was it even distantly possible, in spite of the hundred refusals she had given him, that she cared for him after all? The bare suspicion that this might be so took his breath away.

'Lorrie, why did you come?'

She glanced at him and looked away.

Wil stumbled forward. 'Lorrie! You can't mean, Lorrie'—— he gasped.

'Come, Wil, you know I hate scenes. Do behave like an ordinary man.'

Her voice fell cold on his ears. He sank into an arm-chair at her side. 'How did this splendid thing come about? Good heavens! I hope I 'm not dreaming.'

'I think you are going a little too fast. I have said nothing yet to make you imagine you *are* dreaming.'

'Don't tell me that I am mistaken! Lorrie, you mean that you have changed your mind—that you care for me more than you used to pretend.'

She shuddered from head to foot.

'After all is said and done, I 'm not such a bad sort of chap, and—and—you might do worse, you know,' went on Wil. The divine moment was over for him, and he was himself again, the same self-conceited Wil she had grown so tired of long ago.

'You are rather jumping to conclusions.'

'By Gad! then I 'll make the matter certain. Lady Madesson, will you marry me?'

'I don't know,' she said. 'I may.'

'Lorrie, do you love me?' He bent forward to look up into her face with a hint of an accepted lover's complacency.

'No.'

The single crisp word took him aback.

'No?'

'No,' she repeated quietly. 'But if I consent to marry you I will make you a kind and indulgent wife—I won't say a good one, because if I really cared for you I should prevent you making a fool of yourself in the dozen ways you incline to.'

''Pon my word, that 's not particularly flattering,' he said on a sulky note.

'By no means; but you 'll find it satisfactory,' Lorrie rejoined with a faint laugh. 'Wil, I may be persuaded to marry you, but only on my own conditions.' She was drawing the gloves

from her hands as she spoke—the well-shaped, fine hands that he had so often watched.

'I'm not afraid of conditions. Go on, dear.' He stretched out his legs to listen comfortably.

'You have often boasted to me of your family,' she said.

'I have good reason to. You can't better us.'

She raised her eyebrows. 'You have told me that they were proud, but I find I am quite a lot prouder than they are.'

'Tell 'em so.' He laughed aloud. 'I bet you'd make 'em sit up!'

'Probably, for in no circumstances whatever will I stoop to become a relative, even by marriage, of M. de Sarsan.'

Wil whistled. 'I say, you don't mean that?'

'Absolutely!' Her brilliant eyes convinced him.

'But, you know, they are going to be married on Monday,' expostulated Wil.

She shrugged her shoulders. 'That is not my business; it's yours.'

He drew in his legs with a jerk. 'But what on earth do you expect me to do?'

'Put a stop to it,' she answered.

'My dear, good girl, do I understand that you expect me at the eleventh hour to put a stop to Alice's marriage?' he exclaimed.

'Why not? I am going to provide for you, so you don't need De Sarsan any longer. And as for Alice, I'm certain she will be only too delighted to cry off her bargain,' said Lorrie casually.

'There are all the hundreds of presents already in the house, and'——

'Stop, Wil! Those are details; we may drop them out. The main point is that you say you care for me and would do anything to make me your wife.'

'I swear that is true! But'——

'Very well. You know my condition. You must stop the wedding, and make Alice promise never to marry that man—that is all.'

Wil groaned. 'It's a pretty big order. I don't know how I shall face Aunt Marion!'

Lorrie sighed impatiently and began to replace her gloves. 'You must make your choice. Either remain De Sarsan's pensioner for life or become mine.'

'I say, Lorrie! I'll be your husband,' he amended.

'You'll be both,' she said with a little, crooked smile. 'As for Mrs Westaway—why, Wil, I thought you had some courage.'

'So I have! I can fight for myself.'

She ceased putting on her gloves to smile at him over her half-gloved hand. 'How about fighting for me?'

Such a look would have conquered any living man. It gave to Wil the desperate courage he knew he should need before he was through with the family feud ahead of him.

'I'll do it! I swear I will! I won't lose you now, Lorrie!'

Lorrie stood up; the colour had entirely left her face; she realised to what she was pledging herself. 'If you break off the marriage with De Sarsan I will keep my word,' she said, and moved to the door. Then she turned back. 'I don't suppose Alice will be very comfortable in this house when all this is done. You'd better send her to me.'

(To be continued.)

'THE SQUARE' AND 'THE CROSS.'

By Lieutenant-Colonel Sir Henry Smith, K.C.B.

CHAPTER I.

THERE is nothing perhaps that a criminal is more averse to than having his photograph taken. In *Forging his Chains*, a book written by the notorious George Bidwell* after his liberation and return to America, there is a picture of a convict, held by seven warders at Newgate, screwing his face up into all sorts of contortions in the endeavour to defeat the camera turned on to him. A photograph of a criminal is of immense service to the police, and, when a man is 'wanted,' is forwarded with the utmost rapidity from the Metropolis to seaports such as Liverpool and Southampton, and in like manner from seaports to the Metropolis.

Nowadays, of course, to get a correct representation of a man is simple. A kodak is instantaneous, and can be used to advantage when prisoners are in the exercise-yard of a jail, or with effect on a man walking in the street or looking in at a shop-window. It is only the little click that gives notice of what has been done, and thereby hangs a tale.

One lovely summer day about fifteen years ago I was walking along a street not far from Smithfield Market—through which 'Mr Sikes, dragging Oliver after him,' made his way in the early morning on 'the expedition' to Shepperton—when I noticed a man advancing towards me, a man I at once thought I had seen before, of powerful build, and apparently from forty-five to fifty years of age. After we passed each other, when at a distance of about fifteen yards, we came to the right-about simultaneously and advanced to within speaking distance.

'You are William Blank,' I said.

'And you are Colonel Smith,' he replied.

* Bidwell, with his brother Austin and two others, was sentenced to penal servitude for life in 1873 for obtaining a very large sum of money by forgery from the Bank of England.

I shook his hand most cordially, knowing well that a more notorious criminal never breathed. 'I must have a talk with you,' I continued; 'come up to the public-house at the corner.'

As we entered it was easily seen he was well known there. The place was crowded, and we adjourned to a little parlour behind the bar. I took some silver from my pocket.

But he anticipated my intention. 'No, no, sir,' he said; 'you entertained me once, and rather longer than I wanted to.' I was the means of his getting twelve months' hard labour. 'I am the entertainer now;' and, ringing the bell, he ordered two glasses of gin and water.

'Why shake hands or condescend to drink with a man like that?' I hear some one say. Firstly, because I always endeavoured to find out the antecedents of criminals whom I had been instrumental in getting convicted; secondly, because this man's extraordinary career and his uncomplaining fortitude when he was the victim of judicial error fascinated me; and, thirdly, because, as far as I could judge, he uniformly spoke the truth. I was anxious again to put him to the test.

'I have never lost sight of you,' I said, 'since first we met. You worked out that long ten years in a French prison?'

'I did, sir, to the bitter end.'

'You then were sentenced to penal servitude for life?'

'I was.'

'And having escaped, if all tales are true, you murdered a man in the States?'

'I am no murderer!' he said vehemently. 'He drew on me, but I was too quick for him. It is true I killed him, but he would have killed me; I shot him in self-defence. You say you have never lost sight of me. I have never lost sight of you—believe it or not as you like—for you are almost the only man who has ever said a kind word to me. The first thing I asked when I was once again free was what had become of you. I am pleased to have an opportunity of thanking you, sir.'

'You can easily repay me for any kindness I have shown you,' I said.

'How?' he asked eagerly.

'By going on "the square,"' I replied.

'I'll do it, sir,' he said; 'you may rely on me.'

On leaving the public-house we stood for a minute or two on the pavement while I gave him some advice, and reminded him that were he to go on 'the cross' he would certainly end his days in prison.

'Don't you fear, sir,' he said; 'I'll keep my word.' At that moment we heard the click of the kodak. 'That infernal thing again!' he exclaimed. 'I'll not stand it!' while an evil look came over his face.

'Never mind him,' I said; 'it is worse for me than you. If they've got you, they've got me too; they'll think I've joined the opposition.'

This restored him to good humour. 'That's true, sir; no doubt about it. Good-bye.' He went on his way, and I saw him no more. Up to date he has kept his word.

CHAPTER II.
